- To move the hole position upward: Enter the value of [-]

10. Touch [Test Copy].
11. Select the tray loading paper for the test copy.
12. Touch [3].
13. Touch [Z-Fold].
14. Select the number of punch holes in the "Punch" list, and then press the start key.
15. Check the punch hole positions.
16. Touch [END] to return to the adjustment screen.
17. Touch $[\mathrm{OK}]$ twice.
18. Touch [Exit] on the Service Mode screen.

### 5.29.6 FS-FN adjustment - Punch horizontal position (Z-fold) (ZU-609/PK-523)

(1) Use

- To adjust the position of the punch hole in the horizontal direction when ZU-609 is in use.

## (2) Setting range

- Width B should fall within the following target.

| Target | $2-4$ hole | $B=11.0 \mathrm{~mm} \pm 3.0 \mathrm{~mm}$ |
| :--- | :--- | :--- |
|  | $2-3$ hole | $B=9.5 \mathrm{~mm} \pm 3.0 \mathrm{~mm}$ |
|  | 4 hole | $B=10.5 \mathrm{~mm} \pm 3.0 \mathrm{~mm}$ |
| Setting range | -5.0 mm to $+5.0 \mathrm{~mm}($ Step $=0.1 \mathrm{~mm})$ |  |

## (3) Procedure

1. Make a copy sample in the punch mode.
2. Check to see if the width from the paper end to the center of the punch hole in the copy sample falls within the target. Complete the adjustment, if the measured value falls within the target.
3. Call the Service Mode to the screen.
4. Touch [Finisher] -> [FS-FN adjustment] -> [Punch horizontal position (Z-fold)].
5. Make the setting using $[+]$ or $[-]$.

- To make width B greater: Enter the value of [+]
- To make width B smaller: Enter the value of [-]

6. Touch [Test Copy].
7. Select the tray loading paper for the test copy.
8. Touch [3].
9. Touch [Z-Fold].
10. Select the number of punch holes in the "Punch" list, and then press the start key.
11. Check the punch hole positions.
12. Touch [END] to return to the adjustment screen.
13. Touch $[\mathrm{OK}]$ twice.
14. Touch [Exit] on the Service Mode screen.
15. Turn OFF the main power switch, wait for 10 sec., then turn the switch ON.

### 5.29.7 FS-FN adjustment - Resist loop size (Z-fold) (ZU-609)

(1) Use

- Adjust the size of the punch resist loop that is applied when ZU-609 operates.
- Used when tilted punched hole position or wrinkled paper occurs.
(2) Procedure

1. Call the Service Mode to the screen.
2. Touch [Finisher] -> [FS-FN adjustment] -> [Resist loop size (Z-fold)].
3. Touch the paper type where resist loop size is adjusted.
4. Set the target using the [+] / [-] keys.

- Misaligned punched holes: Enter the value of [+]
- Wrinkled paper: Enter the value of [-]

5. Touch [Test Copy].
6. Select the tray loading paper for the test copy.
7. Touch [3].
8. Touch [Z-Fold].
9. Select the number of punch holes in the "Punch" list, and then press the start key.
10. Check the punch hole positions.
11. Touch [END] to return to the adjustment screen.
12. Touch $[\mathrm{OK}]$ twice.
13. Touch [Exit] on the Service Mode screen.
14. Turn OFF the main power switch, wait for 10 sec., then turn the switch ON.
15. Make copies in the punch mode again and check that the punch hole positions have been adjusted properly.

## (3) Setting range

- -5.0 mm to $+5.0 \mathrm{~mm}($ Step $=0.1 \mathrm{~mm})$

### 5.29.8 FS-FN adjustment - Punch Registration Loop Adj (PK-523)

(1) Use

- To correct the tilt of paper (change the loop amount) before punching operation. (paper conveyed from MFP).
- To address problems such as misaligned punch holes, wrinkled paper, and jam at the punch registration section.

## (2) Procedure

1. Call the Service Mode to the screen.
2. Touch [Finisher] -> [FS-FN adjustment] -> [Punch Registration Loop Adj].
3. Touch the paper type where punch regist loop size is adjusted.
4. Set the target using the [+] / [-] keys.

- Misaligned punched holes: Enter the value of [+]
- Wrinkled paper: Enter the value of [-]

5. Touch $[\mathrm{OK}]$ twice.
6. Touch [Exit] on the Service Mode screen.
7. Turn OFF the main power switch, wait for 10 sec., then turn the switch ON.

## (3) Setting range

- -5.0 mm to $+5.0 \mathrm{~mm}($ Step $=0.1 \mathrm{~mm})$

### 5.29.9 FS-FN adjustment - Punch Resist Loop Size (PI) (PI-507/PK-523)

## (1) Use

- To correct the tilt of paper (change the loop amount) before punching operation. (paper conveyed from post inserter).
- To address problems such as misaligned punch holes, wrinkled paper, and jam at the punch registration section.

## (2) Procedure

1. Call the Service Mode to the screen.
2. Touch [Finisher] -> [FS-FN adjustment] -> [Punch Regist Loop Size (PI)].
3. Touch [Upper] or [Lower].
4. Select a type of paper where adjustment is made
5. Set the target using the [+] / [-] keys.

- Misaligned punched holes: Enter the value of [+]
- Wrinkled paper: Enter the value of [-]

6. Touch $[\mathrm{OK}]$ twice.
7. Touch [Exit] on the Service Mode screen.
8. Turn OFF the main power switch, wait for 10 sec., then turn the switch ON.

## (3) Setting range

- -5.0 mm to $+5.0 \mathrm{~mm}($ Step $=0.1 \mathrm{~mm})$

### 5.29.10 FS-FN adjustment - 1st Z-Fold Position/2nd Z-Fold Position (ZU-609)

(1) Use

- To adjust the positions of the 1st Z-fold and 2nd Z-fold for the Z-fold mode.
(2) Setting range

$$
<11 \times 17, \mathrm{~A} 3, \mathrm{~B} 4,8 \mathrm{~K}>
$$

$<8.5 \times 14>$

| $[1]$ | Position of the first fold | $[2]$ | Position of the second fold |
| :--- | :--- | :--- | :--- |
| $[L]$ | Length of the first fold | $[a]$ | Length of the second fold |

- Widths " $a$ " and " $L$ " should fall within the following target.

| Target | $11 \times 17$ | - Length a: $4.0 \mathrm{~mm} \pm 2.0 \mathrm{~mm}$ <br> - Length L: $215 \mathrm{~mm}+0 /-7.0 \mathrm{~mm}$ |
| :---: | :---: | :---: |
|  | A3 | - Length a: $4.0 \mathrm{~mm} \pm 2.0 \mathrm{~mm}$ <br> - Length L: $209 \mathrm{~mm}+0 /-7.0 \mathrm{~mm}$ |
|  | B4 | - Length a: $4.0 \mathrm{~mm} \pm 2.0 \mathrm{~mm}$ <br> - Length L: $181 \mathrm{~mm}+0 /-7.0 \mathrm{~mm}$ |
|  | $8.5 \times 14 *$ | - Length L: $278 \mathrm{~mm}+0 /-7.0 \mathrm{~mm}$ |
|  | 8K | - Length a: $4.0 \mathrm{~mm} \pm 2.0 \mathrm{~mm}$ <br> - Length L: $194 \mathrm{~mm}+0 /-7.0 \mathrm{~mm}$ |
| Setting range | -12.8 mm to $+12.7 \mathrm{~mm}($ Step $=0.1 \mathrm{~mm})$ |  |

- *: $8.5 \times 14$ is available for only an half fold.

## (3) Procedure

1. Make copies in the Z-fold mode.
2. Check whether the Z-fold widths "a" and "L" of ejected copy samples are within the target. Complete the adjustment, if the measured values fall within the target.
3. Call the Service Mode to the screen.
4. Touch [Finisher] -> [FS-FN adjustment] -> [1st Z-Fold Position] or [2nd Z-Fold Position].
5. Select [ALL] and make the setting using [+] or [-].

- To increase the length of the 1 st fold (L) or 2nd fold (a), enter a negative value with [+] key.
- To decrease the length of the 1 st fold (L) or 2 nd fold (a), enter a positive value with $[-]$ key.

## NOTE

- The adjustment setting value used for each paper size is the value set with [ALL] plus the value set for each paper size.
" Width "a" should not be 2 mm or less.

6. Touch [Test Copy].
7. Select the tray loading paper for the test copy.
8. Touch [3].
9. Touch [Z-Fold], and press the start key.
10. Check the displacement of "width a" and "width L" on the fed out copies.
11. Touch [END] to return to the adjustment screen.
12. Touch [OK] twice.
13. Touch [Exit] on the Service Mode screen.

[^38](2) Setting range

[1] Position of the first tri-fold $\quad$ [2] Position of the second tri-fold

- Check whether the tri-fold widths "a" and "b" of the ejected paper are within the target.

| Target | A4S | Length a: $95 \mathrm{~mm} \pm 2 \mathrm{~mm}$ <br> Length b: $102 \mathrm{~mm} \pm 2 \mathrm{~mm}$ |
| :--- | :--- | :--- |
|  | $8.5 \times 11 \mathrm{~S}$ | Length a: $89.4 \mathrm{~mm} \pm 2 \mathrm{~mm}$ <br> Length b: $96.0 \mathrm{~mm} \pm 2 \mathrm{~mm}$ |
|  | 16 KS | Length a: $88 \mathrm{~mm} \pm 2 \mathrm{~mm}$ <br> Length b: $92 \mathrm{~mm} \pm 2 \mathrm{~mm}$ |
|  | -10.0 mm to $+10.0 \mathrm{~mm} \mathrm{(1} \mathrm{step:} 0.1 \mathrm{~mm})$ |  |

## (3) Procedure

- Make copies in the tri-fold mode.
- Check whether the tri-fold widths "a" and "b" of ejected copy samples are within the target. Complete the adjustment, if the measured values fall within the target.
(a) If the width "a" is out of the target:

1. Call the Service Mode to the screen.
2. Touch [Finisher] -> [FS-FN adjustment] -> [1st Tri-Fold Adjustment].
3. Select a paper size where the tri-fold position needs adjustment.
4. While checking the copy samples, touch $[+]$ or $[-]$ to adjust the tri-fold position.

- To increase the width a, enter a positive value with [ $+\mathrm{]}$.
- To decrease the width a, enter a negative value with [-]

5. Touch [Test Copy].
6. Select the tray loading paper for the test copy.
7. Touch [3].
8. Touch [Tri-Fold], and press the start key.
9. Check displacement of the fold position on the fed out copies.
10. Touch [END] to return to the adjustment screen.
11. Touch [OK] twice.
12. Touch [Exit] on the Service Mode screen.
(b) If the width " b " is out of the target:
13. Call the Service Mode to the screen.
14. Touch [Finisher] -> [FS-FN adjustment] -> [2nd Tri-Fold Adjustment].
15. Select a paper size where the tri-fold position needs adjustment.
16. While checking the copy samples, touch $[+]$ or $[-]$ to adjust the tri-fold position.

- To increase the width $b$, enter a positive value with $[+]$.
- To decrease the width $b$, enter a negative value with [-].

5. Touch [Test Copy].
6. Select the tray loading paper for the test copy.
7. Touch [3].
8. Touch [Tri-Fold], and press the start key.
9. Check displacement of the fold position on the fed out copies.
10. Touch [END] to return to the adjustment screen.
11. Touch [OK] twice.
12. Touch [Exit] on the Service Mode screen.

### 5.29.12 FS-FN adjustment - Punch Edge Adj (PK-520/PK-523)

(1) Use

- To change the horizontal position of the punch holes.
(2) Setting range

- Width $B$ should fall within the following target.

| Target | $9.5 \mathrm{~mm} \pm 1.0 \mathrm{~mm}(2-3$ hole $), 11.0 \mathrm{~mm} \pm 1.0 \mathrm{~mm}(2-4$ hole $), 10.5 \mathrm{~mm} \pm 1.0 \mathrm{~mm}$ (SWE4 hole) |
| :--- | :--- |
| Setting range | -5.0 mm to $+5.0 \mathrm{~mm}(1$ step: 0.1 mm$)$ |

## (3) Procedure

1. Make a copy sample in the punch mode.
2. Make an adjustment so that the width $B$ is within the target.
3. Call the Service Mode to the screen.
4. Touch [Finisher] -> [FS-FN adjustment] -> [Punch Edge Adj].
5. Touch the paper type where punch horizontal position is adjusted.
6. Look at the copy and adjust the punch horizontal position with the [+] / [-] key.

- To make width B greater: Enter the value of [+]
- To make width B smaller: Enter the value of [-]

7. Touch [Test Copy].
8. Select the tray loading paper for the test copy.
9. Touch [3].
10. Select the number of punch holes in the "Punch" list, and then press the start key.
11. Check the punch hole positions.
12. Touch [END] to return to the adjustment screen.
13. Touch $[\mathrm{OK}]$ twice.
14. Touch [Exit] on the Service Mode screen.

### 5.29.13 FS-FN adjustment - Punch Regist Loop Size (PK-519/PK-520)

(1) Use

- Adjusts the punch loop size used for paper exited from the main body.
- Used when tilted punched hole position, wrinkled paper, or jam at punch registration section occurs.

## (2) Setting range

- -4.0 to +4.0 mm
(3) Procedure

1. Call the Service Mode to the screen.
2. Touch [Finisher] -> [FS-FN adjustment] -> [Punch Regist Loop Size].
3. Select a paper type where the punch hole position needs adjustment.
4. Set the target using the $[+] /[-]$ keys.

- Misaligned punched holes: Enter the value of [+]
- Wrinkled paper: Enter the value of [-]

5. Touch [OK].
6. Touch [Exit] on the Service Mode screen.

### 5.29.14 FS-FN adjustment - PI Size Detection (PI-507)

(1) Use

- To specify paper sizes that the post inserter detects.
- To set a paper size with which size detection is made when a paper having a similar size is placed on the feeder.

## (2) Procedure

1. Call the Service Mode to the screen.
2. Touch [Finisher] -> [FS-FN adjustment] -> [PI Size Detection].
3. Touch [Mode 1].
4. Select a desired paper size with which size detection is made.
5. Make the same setting in [Mode 2] to [Mode 6].
6. Touch $[\mathrm{OK}]$ twice.
7. Touch [Exit] on the Service Mode screen.

### 5.29.15 FS-FN adjustment - Post Inserter Adjustment (PI-507)

(1) Use

- To make automatic post inserter size detection adjustments separately in each of the upper and lower trays.
- Make this adjustment when the post inserter cannot make proper size detection.
- Make this adjustment after performing PI displacement adjustment.
(2) Procedure

1. Call the Service Mode to the screen
2. Touch [Finisher] -> [FS-FN adjustment] -> [Post Inserter Adjustment].
3. Touch [Upper Tray].
4. Place A4S paper on the upper tray and touch [A4 $\square$ ].
5. Touch Start key.
6. Confirm that the result is OK.
7. Touch [Lower Tray].
8. Place A4S paper on the lower tray and touch [A4 $\square$ ].
9. Touch Start key
10. Confirm that the result is OK.
11. Touch [OK] twice.
12. Touch [Exit] on the Service Mode screen.

### 5.29.16 FS-FN adjustment - Finisher Components Test Mode (FS-533/FS-534/FS-534SD/FS-536/FS-536SD/FS-537/ FS-537SD)

(1) Use

- Use this adjustment to check finisher's operation.
(2) Procedure

1. Call the Service Mode to the screen.
2. Touch [Finisher] -> [FS-FN adjustment] -> [Finisher Components Test Mode].
3. Select a mode
4. Press the Start key to start finisher operation.
5. Press the Stop key to stop ongoing finisher operation.
(3) Finisher components list (FS-537/FS-537SD/PK-523/PI-507/ZU-609)

| Mode |  |
| :---: | :---: |
|  | M301/Punch Drive M: Execute Punch (3- or 4-Hole) |
|  | M203 (PI divert M) Paper Line velocity |
|  | MC201 (upper paper feed clutch) ON |
|  | MC202 (lower paper feed clutch) ON |
|  | M201 (Upper rise descent M) Down (HP Search) |
|  | M201 (Upper rise descent M) Up |
|  | M202 (Lower rise descent M) Down (HP Search) |
|  | M202 (Lower rise descent M) Up |
|  | SD201 (upper row move solenoid) ON |
|  | SD202 (the lower move solenoid) ON |
|  | MC203 (registration transportation clutch) ON |
|  | SD Paper Transport Motor |
| Finisher Components Test Mode 4 | Folding Roller Motor |
|  | Leading Edge Gripper Solenoid |
|  | Leading Edge Stopper Motor |
|  | CD Alignment Plate Motor |
|  | Folding Knife Motor |
|  | Chip Box Change Motor |
|  | Tail Edge Holding Plate Motor |
|  | SD Paddle Motor |
|  | Tri-folding Knife Motor |

(4) Finisher components list (FS-536/FS-536SD/PK-520)

|  | Mode |
| :---: | :---: |
| Finisher Components Test Mode 1 | Paper Transport Motor |
|  | Paper Entrance Motor |
|  | Paper Exit Motor |
|  | Paper Alignment Plate Motor/F |
|  | Main Tray Up/Down Motor |
|  | Paper Alignment Plate Motor/R |
|  | Side Stopper Guide Motor |
|  | Paper Exit Belt Motor |
|  | Exit Roller Retraction Motor |
|  | Tail Edge Holding Plate Motor |
|  | Side Stapler Movement Motor |
|  | Pre-Discharge Drive Motor |
|  | Punch Drive Motor |
|  | Paddle Motor |
| Finisher Components Test Mode 2 | Switch Output Tray Motor |
|  | SD Paper Transport Motor |
|  | Folding Roller Motor |
|  | Leading Edge Gripper Solenoid |
|  | Leading Edge Stopper Motor |
|  | CD Alignment Plate Motor |
|  | Folding Knife Motor |
|  | Chip Box Change Motor |
|  | Paper Discharge Control Motor |
|  | SD Paddle Motor |
|  | Tri-folding Knife Motor |

(5) Finisher components list (FS-534/FS-534SD/PK-520)

| Mode |  |  |  |
| :--- | :--- | :---: | :---: |
| Finisher Components Test Mode 1 | Paper Transport Motor |  |  |
|  | Paper Entrance Motor |  |  |
|  | Paper Exit Motor |  |  |
|  | Paper Alignment Plate Motor/F |  |  |
|  | Main Tray Up/Down Motor |  |  |

| Mode |  |
| :---: | :---: |
|  | Paper Alignment Plate Motor/R |
|  | Side Stopper Guide Motor |
|  | Paper Exit Belt Motor |
|  | Exit Roller Retraction Motor |
|  | Paper Discharge Control Motor |
|  | Side Stapler Movement Motor |
|  | Pre-Discharge Drive Motor |
|  | Punch Drive Motor |
|  | Paddle Motor |
| Finisher Components Test Mode 2 | Switch Output Tray Motor |
|  | SD Paper Transport Motor |
|  | Folding Roller Motor |
|  | Leading Edge Gripper Solenoid |
|  | Leading Edge Stopper Motor |
|  | CD Alignment Plate Motor |
|  | Folding Knife Motor |
|  | Chip Box Change Motor |
|  | Trail Edge Holding Plate Motor |
|  | SD Paddle Motor |
|  | Tri-folding Knife Motor |

(6) Finisher components list (FS-533)

| Mode |
| :--- | :--- |
| Stapler Movement |
| Alignment Plate F/R Movement |
| Tray up/down Operation |
| Exit Roller Retraction |
| Conveyance Drive |
| Paper Surface Detect Solenoid |
| Paddle 1 Rotation Solenoid Drive |
| Punch Drive Motor |
| Batch Solenoid Driver |

### 5.29.17 FS-FN adjustment - Alignment plate Position (FS-533)

(1) Use

- When FS-533 is installed, use this feature to fine adjust the aligning plate that aligns ejected paper.
(2) Default setting
- 0.0 mm

## (3) Setting range

- -10.0 mm to +10.0 mm (1 step: 0.1 mm )

## (4) Procedure

1. Call the Service Mode to the screen.
2. Touch [Finisher] -> [FS-FN adjustment] -> [Alignment Plate Position].
3. Select the [Alignment Plate Position (Back)] or [Alignment Plate Position (Side)].
4. Set and adjust a value with the $[+] /[-]$ key.
5. Touch [OK].
6. Touch [Exit] on the Service Mode screen.
7. Turn OFF the main power switch, wait for 10 sec ., then turn the switch ON.
5.29.18 FS-FN adjustment - Paper Alignment Guides W. Adj. (FS-534/FS-534SD/FS-536/FS-536SD/FS-537/FS-537SD)
(1) Use

- To fine adjust the horizontal width of the aligning plate.
- Use this feature to fine adjust the aligning plate that aligns ejected paper.
(2) Default setting
- 0.0 mm

## (3) Setting range

- -10.0 mm to +10.0 mm (1 step: 0.1 mm )
(4) Procedure

1. Call the Service Mode to the screen.
2. Touch [Finisher] -> [FS-FN adjustment] -> [Paper Alignment Guides W. Adj].
3. Select a mode you want to adjust.
4. Set and adjust a value with the $[+] /[-]$ key.
5. Touch [OK].
6. Touch [Exit] on the Service Mode screen.

### 5.29.19 FS-FN adjustment - ZFold1st Fold Loop Size (ZU-609)

(1) Use

- To adjust the variation in the 1st fold position of Z-Fold.
- Forming a loop of stiff and slippery paper is difficult and a folding position on the paper may not be constant. This function adjusts loop amount to make the folding position constant.

| Increase loop amount | increase the adjustment value |
| :--- | :--- |
| Decrease loop amount | decrease the adjustment value |

### 5.29.20 FS-FN adjustment - ZFold2nd Fold Loop Size (ZU-609)

(1) Use

- To adjust the variation in the 2nd fold position of Z-Fold.
- Forming a loop of stiff and slippery paper is difficult and a folding position on the paper may not be constant. This function adjusts loop amount to make the folding position constant.

| Increase loop amount | increase the adjustment value |
| :--- | :--- |
| Decrease loop amount | decrease the adjustment value |

### 5.29.21 FS-FN adjustment - ZFold2nd Fold Speed (ZU-609)

- Not used

### 5.29.22 FS-FN adjustment - ZFold Adjust Custom (ZU-609)

- Not used

### 5.29.23 Max Staple Limit Setting (FS-537/FS-537SD)

(1) Use

- When FS-537or FS-537SD is installed, specify the maximum number of sheets that can be stapled together.
- To change the maximum that can be stapled together.

## (2) Procedure

1. Call the Service Mode to the screen.
2. Touch [Finisher] -> [Max Staple Limit Setting].
3. Enter a desirable maximum number with the 10-key pad.
4. Touch [END].
5. Turn OFF the main power switch. Then, wait for 10 sec . or more and turn ON the main power switch.

NOTE

- If mixed originals includes one or more large size ones ( $\mathrm{A} 3 / 11 \times 17$ or more), the maximum that can be stapled together is subject to the setting of large size staple limit restriction.
- If large size staple limit restriction is set to [-20 pieces] and the maximum number of sheets to be stapled together less 20 is 2 or less, then the restricted number of sheets as the maximum is 2.
- When FS-537or FS537SD is installed and the staples for 50 sheets are detected, 50 sheets becomes the upper limit even though the setting of the upper limit up to which sheets can be stapled exceeds 50 sheets.
(3) Default setting
- Staple option setting: 100 Piece
- Large size staple limit restriction: Do not do.
(4) Setting range
- Staple option setting: 2 to 100
- Large size staple limit restriction: [-20 pieces] or [Do not do.]

### 5.29.24 Punch Option Setting

(1) Use

- Specifies punch settings depending on the optional punch kit attached to the finisher.
- An individual punch setting needs to be made according to the type of the punch option.
(2) Procedure

1. Call the Service Mode to the screen.
2. Touch [Finisher] -> [Punch Option Setting].
3. Select the type of punch kit.
4. Select the number of punch holes in accordance with the punch kit destination type.
5. Touch [decision].
6. Touch [END].
7. Touch [Exit] on the Service Mode screen.
(3) Default setting

- Non-installat.

### 5.29.25 Max. \# of Folded Sheets Setting

(1) Use

- Imposes restriction on the number of sheets to be folded in each of different folding modes.
- To change the maximum number of sheets to be folded in each of different folding modes.

## (2) Procedure

1. Call the Service Mode to the screen.
2. Touch [Finisher] -> [Max. \# of Folded Sheets Setting].
3. Select a folding mode where the maximum is restricted and enter a desirable maximum number with the 10-key pad.
4. Touch [END].
5. Touch [Exit] on the Service Mode screen.

## (3) Default setting

- Center Fold: 5 Piece
- Center Staple: 20 Piece
- Tri-Fold: 3 Piece
- Z fold/staple using together: 10 Piece
- Z fold: 50 pieces

## (4) Setting range

Center Fold

- 1 to 5 Piece

Center Staple

- 2 to 20 Piece

Tri-Fold

- 1 to 3 Piece

Z fold/staple using together

- 2 to 10 Piece

Z fold

- 50 Piece/40 Piece/30 Piece/20 Piece

### 5.29.26 Tri-Fold Output Setting (FS-537SD)

(1) Use

- To set the position where paper is ejected when paper is conveyed to the saddle stitcher in tri-fold mode.
(2) Default setting
- Normal Output
(3) Setting item
- Normal Output
- Extend Output

### 5.29.27 Job Separator

(1) Use

- Checks the job separator's operation.

## (2) Procedure

1. Call the Service Mode to the screen.
2. Touch [Finisher] -> [Job Separator].
3. Select the mode where you wish to check the operation.
4. Press the Start key to start job separator operation.
5. Press the Stop key to stop ongoing job separator operation.

### 5.30 Network Settings

- It is displayed when this machine is equipped with an optional upgrade kit UK-212or UK-215.
- To perform a remote control from an Android tablet terminal or iOS device, bizhub Remote Access are required.

### 5.30.1 2nd Network Setting - 2nd network card settings

(1) Use

- To be configured when an optional Upgrade Kit UK-212 or UK-215has been installed in this machine.
(2) Default setting
- Unset
(3) Setting item
- Set
- Unset
- When [Set] is selected, configure the following settings.

### 5.30.2 2nd Network Setting - Network Interface Settings

## NOTE

- Before making settings, note the network environment of the customer and make the settings to suit the environment.
(1) Use
- To connect the MFP main unit as a wireless LAN adapter to a wireless LAN access point connected to the LAN environment. (when Wireless Only or Wired+Wireless (Secondary Mode) is selected)
- To perform direct communication between the MFP main unit and a mobile device. (when Wired+Wireless (Primary Mode) Wired +Wireless (Simple AP Mode), or Wired +Wireless (Wi-Fi Direct) is selected)
(2) Setting item

| Network Interface Settings | Description |
| :---: | :---: |
| Wired Only | Use when the MFP main unit is connected only to a LAN environment. |
| Wireless Only | - Use when the MFP main unit is connected only to a wireless LAN environment. <br> - A job is received from the client via the wireless LAN access point and executed. |
| Wired+Wireless (Secondary Mode) | - Use when the MFP main unit is connected to both a LAN environment and a wireless LAN environment. <br> - A job is received from the client via the LAN and executed. <br> - A job is received from the client via the wireless LAN access point and executed. |
| Wired+Wireless (Primary Mode)*1 | - The MFP main unit is used as a wireless LAN access point (Primary Mode). |
| Wired+Wireless (Simple AP Mode) *2 | - When starting up the MFP main unit, perform wireless LAN communication between the MFP main unit and the mobile device (Android device, iOS device, or devices supporting Wi-Fi) without via wireless LAN access point. <br> - Use when the MFP main unit is connected to both a LAN environment and a wireless LAN environment. |
| Wired+Wireless (Wi-Fi Direct) | - Use when the MFP main unit is connected to both a LAN environment and a wireless LAN environment. <br> - The MFP main unit is used as a wireless LAN access point. <br> - With this mode, a mobile device (excluding iOS) can be connected to Wi-Fi Direct authentication devices easily. |

[^39]- *2: When UK-215 is installed.

NOTICE

- See THEORY OF OPERATION UK-212/UK-215 for more information.

### 5.30.3 2nd Network Setting - SSID

(1) Use

- To enter the SSID of the wireless LAN access point connected to the machine (using up to 32 characters).

### 5.30.4 2nd Network Setting - Authentication/Encryption Algorithm

(1) Use

- To set the algorithm used for authentication or encryption.
(2) Default setting
- No Authentication/Encryption
(3) Setting item
- "No Authentication/Encryption"
- WEP
- WPA-PSK (AES)
- WPA2-PSK (AES)

### 5.30.5 2nd Network Setting - WEP Key

(1) Use

- To be set when WEP is selected for authentication/encryption Algorithm.
(2) Procedure

1. Select an input method.
2. Touch Edit, then enter a new WEP key.
3. Touch OK.
4. Enter the WEP key again to make a check.
5. Touch OK.

### 5.30.6 2nd Network Setting - Passphrase

(1) Use

- To be set when a method including WPA is selected for authentication/encryption Algorithm.
(2) Procedure
<Input method>
- Select an input method.
<Security key>
- Enter a value of the security key of passphrase.
<Passphrase Auto Update>
- Set ON/OFF for passphrase auto update. [Yes] is specified by default.
<Update Interval>
- Set the interval for updating passphrase. [60] minutes is specified by default.
<40 to 20 MHz Auto Switch>
- Set [ON] to try a high-speed communication with 40 MHz . [OFF] is specified by default.

### 5.30.7 2nd Network Setting - Wireless Channel

(1) Use

- To set a wireless channel.
(2) Default setting
- Auto
(3) Setting item
- 1 to 13
- Auto

### 5.30.8 2nd Network Setting - ANY Connection

(1) Use

- To set whether or not to allow the ANY connection.
(2) Default setting
- Permit
(3) Setting item
- Permit
- Prohibit
5.30.9 2nd Network Setting - Connect permission extension address list
(1) Use
- To allow the connection through the only device with specified MAC address.
(2) Procedure

1. Touch [Edit], then enter the MAC address.

### 5.30.10 2nd Network Setting - DHCP Server Setting

(1) Use

- To set whether or not to enable the DHCP server.
(2) Default setting
- ON
(3) Setting item
- ON
- OFF
- If set to ON, set the IP leasing address, subnet mask and leasing period.

### 5.30.11 2nd Network Setting - TCP/IP Settings

(1) Use

- To set TCP/IP.
(2) Procedure

1. If IPv4 Settings is selected, select [Auto Input] or [Enter New Address]

- If [Auto Input] is selected, configure DHCP settings.
- If [Enter New Address] is selected, set [IP Address] and [Subnet Mask].

2. If IPv6 Settings is selected, the link-local address will be displayed as IPv6 type.

### 5.30.12 Remote Service Setting

## (1) Function Setting

(a) Enable Settings

- Use
- To set whether to use the remote service.

NOTE

- When [ON] is selected, [Service Mode] -> [Machine Update Setting] -> [Machine Auto Update setting] -> [Auto update setting] will not be displayed.
- When [ON] is selected, [Service Mode] -> [Machine Update Setting] -> [Machine Auto Update setting] -> [Relay server setting] will not be displayed.
- Default setting
- Disable
- Setting item
- ON
- Disable
(b) Server Settings
- Use
- To set URL, ID and password of the server to be used on remote service communication.
- Setting item

| URL | (Address*1 or host name*2): port number*3 <br> *1: IPv4 or IPv6 address <br> *2: Alphanumeric characters and symbols up to 253 characters |
| :--- | :--- |
| ID | Alphanumeric characters and symbols: 1-64 characters |
| Password | Alphanumeric characters and symbols: 0-64 characters |

(2) Proxy Server Setting
(a) Enable Settings

- Use
- To set whether to use the proxy server.
- When [ON] is set, the [WebDAV Synchronize] and [Proxy Server] settings can be configured.
- Default setting
- Disable
- Setting item
- ON
- Disable
(b) WebDAV Synchronize
- Use
- To set whether to synchronize with [WebDAV Client Settings] in Administrator settings.
- When [Synchronize] is set, operation is performed in accordance with the configuration of the [WebDAV Client Settings] within the Administrator settings.
NOTE
- The [Proxy Server] is no longer appears when [Synchronize] is set.
- Default setting
- Do not Synchronize
- Setting item
- Synchronize
- Do not Synchronize
(c) Proxy Server
- Use
- To configure the proxy server settings.
- Setting item

| Host Name | Address*1 or hostname*2 <br> *1: IPv4 or IPv6 address <br> *2: Alphanumeric characters and symbols up to 253 characters |
| :--- | :--- |
| User Name | Alphanumeric characters and symbols: NULL to 63 characters |
| Password | Alphanumeric characters and symbols: NULL to 63 characters |
| Port Number | 1 to 65535 |

## (3) Maintenance Setting

(a) Identification Code

- Use
- To enter the identification code used to organize and manage multiple MFPs on a per-customer basis.

NOTE

- Note the hierarchical order of the 8-digit identification codes: first 2 digits represent the region code and the last 6 digits represent the management code.
- Setting range
- 0 to 99999999 (Enter an 8-digit number. )
(b) Operator Name
- Use
- To enter the keywords used by maintenance personnel to easily search for corresponding MFPs on the remote service server UI screen.
- Setting range
- Up to 64 alphanumeric characters
(c) Setup
- Use
- To connect to the remote service server manually.
- Touch Start to send the identification code and operator name to the remote service server
(4) XMPP Settings
(a) Function Setting
- Use
- To set whether to use sessions when communicating with the XMPP server

NOTE

- When [Disable] is set, initial commands cannot be received from the remote service server via the XMPP server.
- Default setting
- ON
- Setting item
- ON
- Disable
(b) Connection Setting - Repeat Interval
- Use
- To set the repeat interval used when communication with the XMPP server fails
- Default setting
- 1 Minute
- Setting range
- 1 to 5 Minutes
(c) Connection Setting - Connection Time-out
- Use
- To set the timeout used for communication with the XMPP server.
- Default setting
- 60 sec
- Setting range
- 5 to 300 sec
(d) Connection Setting-SSL
- Use
- To set whether to use the SSL when communicating with the XMPP server.
- Default setting
- ON
- Setting item
- ON
- OFF
(e) Connection Setting - BOSH
- Use
- To set whether to use the BOSH connection when communicating with the XMPP server.
- Default setting
- ON
- Setting item
- ON
- OFF

## (f) Connection server info

- Use
- To confirm the URL, ID, domain name, port number and connection status.

## (5) Always Connection Setting

(a) Maintenance Time

- Use
- To select the maintenance time from [Use Power Save Settings], [Always Connection] or [Individual Settings].
- Default setting
- Individual Settings
- Setting item

| User Power Save Settings | Operates when maintenance can be performed in accordance with power save settings. |
| :--- | :--- |
| Always Connection | Maintenance can be performed at any time. |
| Individual Settings | Maintenance start and end times are configured individually. |

(b) Existence Notice Interval

- Use
- To set the time interval used to send existence notice packets for existence notice from the MFP to the XMPP server.
- Default setting
- 55 sec .
- Setting range
- 1 to 3600 sec.

## (c) Learning Function

- Use
- To set whether to enable "Learning function" used to change the packet transmission interval in accordance with the XMPP session state when sending existence notice.
- When [Enable] is set, the adjust value and lower limit must be configured.
- Default setting
- Disable
- Setting item
- Enable
- Disable

## (d) Learning Function - Adjust Value

- Use
- To lengthen the next packet transmission interval by the amount of the "adjust value" when a existence notice is sent successfully.
- To shorten the next packet transmission interval by the amount of the "adjust value" when a existence notice is sent unsuccessfully.
- Default setting
- 30 sec .
- Setting range
- 1 to 3600 sec.

## (e) Learning Function - Lower Limit

- Use
- To make sure not to set the packet transmission interval shorter than the "lower limit".
- Default setting
- 30 sec .
- Setting range
- 1 to 3600 sec .

### 5.30.13 Port setting

(1) Use

- To set the threshold value for determining the load state of the Raw port.
(2) Default setting
- 3 minutes
(3) Setting item
- 1 to 60 minutes

### 5.31 Machine Update Setting

- By using this setting, the firmware or update file stored in the server can be downloaded over internet for upgrading.

### 5.31.1 Internet ISW - Internet ISW Set

(1) Use

- To set whether or not to enable each setting for Internet ISW.
- To use when upgrading the firmware by Internet ISW.
- Each setting such as Server setting will be valid by setting this to "ON". NOTE
" If [Administrator Settings] -> [Security Settings] -> [Enhanced Security Mode] is set to "ON", this setting will automatically be set to "OFF" and cannot be changed.
(2) Default setting
- OFF
(3) Setting item
- ON
- OFF
- When this setting is set to "ON," [Open Mode Settings] can be configured. When [Open Mode Settings] is set to "Set," firmware download and update via Internet ISW are available in Administrator Settings.

### 5.31.2 Internet ISW - HTTP Setting

- It will be displayed only when [Internet ISW Set] is set to "ON".
(1) HTTP data acquisition setting
(a) Use
- To set whether or not to enable downloading using the HTTP protocol.
- To use when accessing the server using the HTTP protocol.
(b) Default setting
- OFF
(c) Setting item
- ON
- OFF
(2) Connection Time-Out
(a) Use
- To set the time for the timeout for accessing the server.
(b) Default setting
- 60 sec
(c) Setting range
- 30 to 300 sec .

### 5.31.3 Internet ISW - FTP Setting

- It will be displayed only when [Internet ISW Set] is set to "ON".

## (1) FTP data acquisition setting

(a) Use

- To set whether or not to enable downloading using FTP protocol.
- To use when accessing the server with FTP protocol.
(b) Default setting
- ON
(c) Setting item
- ON
- OFF

## (2) Connection Setting

(a) Use

- To set the port No. and the time for timeout when accessing the FTP server, and also to set whether or not to enable PASV mode.
- To use when connecting by the PASV (passive) mode (FTP server side will inform the connection port before connecting).
(b) Procedure (Port Number)
- Enter the port number using the 10-key pad within the range of 1 to 65535.
(c) Default setting (Port Number)
- 21
(d) Procedure (Connection Time Out)
- Enter the value between 1 and 60 (min.) using the 10-key pad.
(e) Default setting (Connection Time Out)
- 1 minute
(f) Default setting (PASV Mode)
- OFF
(g) Setting item (PASV Mode)
- ON
- OFF

### 5.31.4 Internet ISW - Forwarding Access Setting

(1) User ID
(a) Use

- To register the user ID for accessing the program server where firmware is to be stored.
(b) Procedure

1. Select [User ID].
2. Enter the user ID (up to 64 one-byte characters) on the on-screen keyboard.

## (2) Password

(a) Use

- To register the password for accessing the program server where firmware is to be stored.
(b) Procedure

1. Select [Password].
2. Enter the password (up to 64 characters) on the on-screen keyboard.
(3) URL
(a) Use

- To register the address and directory of the program server where the firmware is to be stored in URL.
(b) Procedure

1. Select [URL].
2. Enter the URL (up to 256 one-byte characters) on the on-screen keyboard. NOTE

- Enter the URL which matches to the protocol to be used.

When connecting to http "http:// (Host name or IP address)/ directory name" or "https:// (Host name or IP address)/ directory name".
When connecting to ftp "ftp:// (Host name or IP address) / directory name".
(4) FileName
(a) Use

- To register the file name of the firmware data to be downloaded.
(b) Procedure

1. Select [FileName].
2. Enter the file name (up to 63 one-byte characters) on the on-screen keyboard.

### 5.31.5 Internet ISW - Download

NOTE

- To connect MFP to the Internet via a proxy, the proxy server related settings must be configured in addition to [Forwarding Access Setting]. The setting of the proxy used in the Internet ISW communication is configured in [Administrator Settings] -> [Network Settings] -> [Machine Update Settings] -> [Internet ISW Settings] -> [FTP Server Settings] or [Administrator Settings] -> [Network Settings] -> [Machine Update Settings] -> [HTTP Proxy Settings].

## (1) Download/Update

(a) Use

- Access the program server according to the Internet ISW setting, and download the firmware.
- To use when updating the firmware via network.
- The firmware is downloaded and updated successively. During the firmware download and update, MFP cannot be used.
(b) Procedure

1. Select [Download/Update].
2. Touch [Start] to start downloading the firmware.
3. The message to show the status will be displayed on the screen while connecting and transferring data. NOTE

- If connection to the program server or data download fails, an error code and a message are displayed. Identify the cause of the problem with the error code and reconfigure the settings following the message. Refer to "K.5.1 Error code list for the Internet ISW" for the error codes.

4. When the firmware is normally upgraded, the main body will automatically be restarted to complete the Internet ISW.

## (2) Download

(a) Use

- To access the program server and download the firmware in accordance with the settings configured in Internet ISW Settings.
- As the firmware is downloaded in the background, MFP can be used during download.
- If firmware data already downloaded exits in the HDD, the data is overwritten and replaced by the new data.
(b) Procedure

1. Select [Download].
2. Touch [Start] to start downloading the firmware.
3. The status message appears on the screen during connection and data transfer. In the middle of downloading, the task can be cancelled by touching [Cancel].
NOTE

- If connection to the program server or data download fails, an error code and a message are displayed. Identify the cause of the problem with the error code and reconfigure the settings following the message.
" For details on error codes refer to "K.5.1 Error code list for the Internet ISW".

4. When the firmware download is successfully completed, the result "OK" appears.
(3) Update
(a) Use

- To update the firmware by using the firmware downloaded and saved in the HDD.
- During the firmware download and update, MFP cannot be used.
- This button is not appeared if there is no firmware in the HDD.
(b) Procedure

1. Touch [Update].
2. Check the firmware file version in HDD.
3. Press Start key to update the firmware.
4. When the firmware is normally upgraded, the main body will automatically be restarted to complete the Internet ISW.
(4) Delete
(a) Use

- To delete the firmware file saved in the HDD.
- This button is not appeared if there is no firmware in the HDD.
(b) Procedure

1. Touch [Delete].
2. Press Start key to delete the firmware

### 5.31.6 Internet ISW - Update Start Time Settings

(1) Use

- To set the start time in order to automatically update the downloaded firmware.

## (2) Procedure

1. Select [Set] for [Update Firmware at Specified Time].
2. Touch [Hour] and [Min.] and set the firmware update start time.

NOTE

- If updated firmware has not been downloaded by the specified time, firmware update is not performed.
- If the main power switch is turned OFF during a firmware update, the firmware is updated next time when the main power switch is turned ON.
- If a job is in process when the specified time comes, the firmware is updated after the completion of the job.

### 5.31.7 Machine Auto Update setting - Auto Update setting

- Obtain the update file for the machine from the file storage server, and update the firmware or settings of the machine.
- This function is same as that of the [Administrator Settings] -> [Network Settings], but it will not be used together with the function of the service mode.
- Refer to "Machine Auto Update setting - Procedures for using the Auto Update function" for how to create an update file.

## NOTE

" When [Service Mode] -> [Network Settings] -> [Remote Service setting] -> [Function Setting] -> [Enable Settings] is set to "ON", this setting is not displayed. [Machine Auto Update setting] in Administrator settings is not applicable.
(1) Server 1 Settings - Auto update
(a) Use

- To obtain the update file from the specified location, and configure settings to update the machine at the specified time.
(b) Default setting
- OFF
(c) Setting item
- ON
- OFF

## (d) Procedure

- If [ON] is selected, configure the following settings.

When configuring the settings for SMB with the download protocol *1

| Host Name | Set the host name for the SMB server. |
| :--- | :--- |
| File Path | Set the file path used in the SMB server communication. *2 |
| User Name | Set the user name used to access the SMB server. |
| Password | Set the password used to access the SMB server. |
| Number of retries | Set the number of times to retry when failed to obtain. |

- *1: If the MFP relay server is used as a server on the data providing side, the SMB protocol will not be used.
- *2: Specify the folder in which C_UpdateList.ini is stored. Refer to "Machine Auto Update setting - Procedures for using the Auto Update function" for details.
When HTTP is set for the download protocol

| URL | Set the address of the http server. *1 |
| :--- | :--- |
| User Name | Set the user name used to access the relay server by http protocol. |
| Password | Set a password used to access the http server. |
| Proxy | Select whether or not to use the proxy server. *2 |
| Connection Time-out | Set the timeout period for connecting to the server. |

- *1: Specify the folder in which C_UpdateList.ini is stored. Refer to "Machine Auto Update setting - Procedures for using the Auto Update function" for details.
- *2: If [ON] is selected, set the proxy with [Administrator Settings] -> [Network Settings] -> [Machine Update Settings] -> [HTTP Proxy Settings].

## (2) Server 2-Settings - Auto update

(a) Use

- To obtain the update file from the specified location, and configure settings to update the machine at the specified time.
(b) Default setting
- OFF
(c) Setting item
- ON
- OFF
(d) Procedure
- If [ON] is selected, configure the following settings.

| URL | Set the address of the http server. *1 |
| :--- | :--- |
| User Name | Set the user name used to access the relay server by http protocol. |
| Password | Set a password used to access the http server. |
| Proxy | Select whether or not to use the proxy server. *2 |
| Connection Time-out | Set the timeout period for connecting to the server. |

- *1: Specify the folder in which C_UpdateList.ini is stored. Refer to "Machine Auto Update setting - Procedures for using the Auto Update function" for details.
- *2: If [ON] is selected, set the proxy with [Administrator Settings] -> [Network Settings] -> [Machine Update Settings] -> [HTTP Proxy Settings].
(3) Common Settings
- Configure the common settings for [Server 1 settings] and [Server 2 settings].
(a) Update Time
- Touch Clear to set the time to update the machine.
(b) Polling Settings
- Use: Set the polling period or day of the week and clock for obtaining the update list.
- Default setting: Select Day of the Week
- Setting item
- Set Interval. (Can be set between 1 to 240 minute/ Default setting: 60 Minute)
- Select Day of the Week (Day of the week and clock can be specified/ Default setting: Monday/0 o'clock 0 minute)

## (c) Retry Interval

- Set the period for retrying when failed to obtain.

### 5.31.8 Machine Auto Update setting - Procedures for using the Auto Update function

## (1) Outline

- "Auto Update" is the function, which makes the main body access the program server periodically through the network to obtain a new data, then updates it automatically.

## (2) Service environment

- The following conditions are necessary for using the Auto Update function.
- The MFP main body is connected to such a network environment that the update data can be downloaded on the network using the SMB or http protocol.
- The Auto Update function will not operate when the MFP main body is under the following conditions.
- Main power switch is set to OFF.
- Sub power OFF mode (power key is orange) or ErP auto power OFF mode (power key flashes orange) enabled
- When [Administrator Settings] -> [Security Settings] -> [Enhanced Security Mode] is set to "ON".
- MFP is operating, or there are jobs present (including appointed jobs).
- MFP is in idle with suspended job.
- Trouble has occurred.
- Image file is in the memory.
- Model or the circuit board of the program does not match.

## (3) Preparations

- For using this function effectively, before executing the following procedures contact with the administrator to obtain an agreement.
- Set the network parameter, program server address as well as firewall address to the MFP main body.
- Create a program update information file (C_UpdateList.ini) and store a set of data for updating in the program server.
(a) Method for creating the program update information file (C_UpdateList.ini)
- Specify the firmware, loadable driver, configuration files as shown below.

NOTE

- [FirmWare], Version, FilePath, [LoadableDriver], NumberOfFiles, [Config], [QuickUpdate] and Update must be specified by using the capital letters and small letters properly.
- The file path configured in FilePath describes the relative path from the program update information file.

[^40]

| $[[1]]$ | Firmware updating information | $[[2]]$ | Loadable driver updating information |
| :--- | :--- | :--- | :--- |
| $[[3]]$ | Configuration files updating information | $[[4]]$ | Timing for updating data |
| $[[5]]$ | Comment | - | - |

## Firmware updating information

- [FirmWare], Version, NumberOfFiles, and FilePath are the necessary information.
- Change of version numbers (5-digit number) is to be recognized as that the file has been updated, and the file will be downloaded.
- Specify the number of files at NumberOfFiles. (If not to download, set "0")
- Enter the path and file name in FilePath to access the firmware file.

## Loadable driver updating information

- [LoadableDriver], Version, and NumberOfFiles are the necessary information.
- Change of version numbers (5-digit number) is to be recognized as that the file has been updated, and the file will be downloaded.
- Specify the number of files at NumberOfFiles. (If not to download, set "0")
- Enter the path and file name in FilePath to access the Loadable Driver file.

## Configuration files updating information

- [Config], Version, and NumberOfFiles are the necessary information.
- Change of version numbers (5-digit number) is to be recognized as that the file has been updated, and the file will be downloaded.
- Specify the number of files at NumberOfFiles. (If not to download, set "0")
- Enter the path and file name in FilePath to access the Configuration file(s).
- If multiple files exist, give a number to each of them as FilePath1, FilePath2 as shown in above illustration.

## Timing for updating data

- [QuickUpdate] and Update are the necessary information.
- If Update is set to " 0 ", the downloaded firmware and each setting will be rewritten in accordance with the update time settings.
- If Update is set to "1", the firmware and each setting will be rewritten soon after downloading.

## Comment

- A comment can be inserted between "\#" or ";" and the line break code.
(b) Method for creating the update data

## Configuration of files and folders

- The folder configuration of the sample of C_UpdateList.ini is as shown below.

## Create a configuration file

1. Select [Service Mode] -> [Machine Update Setting] -> [Machine Auto Update setting] -> [Machine Export setting].
2. Insert a USB memory into the USB port.
. Enter a password.
3. Select [START].
4. "Result OK" will be displayed.
5. Complete the data export.
6. Store the export file to the directory described in C_UpdateList.ini.

## NOTE

- On the MFP where a file is to be downloaded, the password specified at above step 3 must be set beforehand by selecting [Service Mode] -> [Machine Update Setting] -> [Machine Auto Update setting] -> [Machine Update Password] .

## Create the Software switch setting/Engine FW DipSW setting file

1. Create CSV files for the data with the required switch number as SoftwareDipSW.csv and EngineDipSW.csv.
2. Store the file to the directory described in C_UpdateList.ini.

A sample of SoftwareDipSW.csv

| A row | Software switch number |
| :--- | :--- |
| B row | Set 1 on the bit to be overwritten (bit7 to bit0 from left side) |
| C row | Set 1 or 0 for new setting at selected bit(s) on B row. (bit7 to bit0 from left side) |

A sample of EngineDipSW.csv

| A row | Engine FW DipSW number |
| :--- | :--- |
| B row | 0 (not select) or 1 (select) |

## Create the user DB data file

1. Create UsbExportData_Auth.tar with a making tool of user DB data.
2. Store created file (UsbExportData_Auth.tar) to the directory described in C_UpdateList.ini.

## (4) Download the update data

1. Select [Service Mode] -> [Machine Update Setting] -> [Machine Auto Update setting] -> [Auto Update setting].
2. Select either [Server 1 settings] or [Server 2 settings] as the connection to configure.
3. Touch [Auto Update], then select [ON].
4. Select [Download Protocol], then select [SMB] or [HTTP]. The HTTP protocol is the only available option for [Server 2 settings].
5. Enter the information for accessing the program server on the setting screen of the selected protocol. At this time, specify the folder in which C_UpdateList.ini is stored at where to be accessed.
6. Touch [OK].
7. Touch [Common Settings].
8. Set [Update Time].
9. Set [Polling Interval].
10. Set [Repeat Interval].

- See items in "Machine Auto Update setting - Auto Update setting" for details of each setting.
- The MFP confirms the program update information file in the program server with an interval set at [Polling Interval].
- The MFP compares the program update information file in the program server with that in the MFP, and starts downloading the update data with a changed Version number.
- The downloaded update data is to be stored in a HDD.
- To use the relay server function of the MFP, select [HTTP].

## (5) Data Update

- Methods for updating the downloaded data are shown below.

## NOTE

- The host name is specified with its IP address.
- When the SMB protocol is used, the MFP uses static IP addresses.
(a) To update the downloaded data automatically.
- If the MFP power is turned on from [Service Mode] -> [Machine Update Setting] -> [Machine Auto Update setting] -> [Auto Update setting] -> [Common Settings] -> [Update time], the firmware will be rewritten automatically. If the power is set to OFF at that time, no rewriting will be executed.
(b) Update the downloaded data using the control panel.
- Select [Service Mode] -> [Machine Update Setting] -> [Machine Auto Update setting] -> [Manually Update] -> [Start], then execute rewriting.

## NOTE

- Do not set the power to OFF under the following state.
- It takes about 45 seconds from touching [Manually Update] -> [Start] to the next operation of the MFP (Auto Power OFF).
- About one minute after the download completed screen being displayed, the MFP will restart.
- When rewriting configuration files followed by the firmware, the MFP will restart again.

## (6) Error code

- The error code can be displayed using [Service Mode] -> [Machine Update Setting] -> [Machine Auto Update setting] -> [Update Log Display], or viewed on the PC where the log which saves up to 100 records sent by using [Transmission log Update] is received. When using the SMB protocol:

| Error code | Cause of error | Countermeasure |
| :---: | :---: | :---: |
| N00107 | - Cannot access the SMB server | - Set the IP address of the server or the server name correctly. <br> - Confirm that if the server runs normally. |
| N04096 |  |  |
| N04097 | - Authentication error | - Set the ID and the password correctly. |
| N04098 |  |  |
| N04105 | - SMB connection error | - Check the SMB connection setting again. |
| N04106 | - Cannot obtain C_UpdateList.ini <br> - Cannot find the data described in C_UpdateList.ini | - Confirm that if C_UpdateList.ini is stored in the server, and set the file path for accessing C_UpdateList.ini correctly. <br> - Set the folder name and the file path correctly. |

When using the HTTP protocol:

| Error code | Cause of error | Countermeasure |
| :---: | :---: | :---: |
| N00107 | - Cannot access the HTTP server | - Set the IP address of the server or the server name correctly. <br> - Confirm that if the server runs normally. |
| N00401 | - Authentication error | - Set the ID and the password correctly. |
| N00404 | - Cannot obtain C_UpdateList.ini <br> - Cannot find the data described in C_UpdateList.ini | - Confirm that if C_UpdateList.ini is stored in the server, and set the file path for accessing C_UpdateList.ini correctly. <br> - Set the folder name and the file path correctly. |

## Common in all cases

| Error code | Cause of error | Countermeasure |
| :---: | :---: | :---: |
| C00000 | - XML setting error | - Make sure that the settings in each configuration file are correct. |
| C00001 | - Decryption error | - Set the decryption password for the configuration files correctly. |
| D00001 | - Format related error (software SW) | - Check for errors in the SoftwareDipSW.csv file. |
| D00010 | - DipSW number not defined (software SW) |  |
| D10001 | - Format related error (Engine DipSW) | - Check for errors in the EngineDipSW.csv file. |
| D10010 | - DipSW number not defined (Engine DipSW) |  |
| F00000 | - Firmware update error | - Check to see if the file on the server is correct. |
| F10107 | - The file is not the firmware file | - Check to see if the file on the server is correct. |
| F10109 |  |  |
| N00100 | - Network communication error | - Check the connection to the network cable and communications settings. |
| N00110 |  |  |
| T10001 | - The C_UpdateList. data has not been properly downloaded <br> - The C_UpdateList. data is corrupted | - Download the file again. <br> - Check to see if the file on the server is correct. |
| T10010 | - Descriptions in C_UpdateList.ini are not correct | - Set the descriptions in C_UpdateList.ini correctly. |
| T10020 |  |  |

### 5.31.9 Machine Auto Update setting - Relay server setting

(1) Update File Download

## (a) Default setting

- OFF
(b) Setting item
- ON
- OFF
(c) Procedure
- If [ON] is selected, configure the following settings.

| Obtain Setting File-URL | Set the address of the file storage server. *1 |
| :--- | :--- |
| Obtain Setting File-User <br> Name | Set the user name used to access the file storage server. |
| Obtain Setting File- <br> Password | Set the password used to access the file storage server. |
| Obtain Setting File-Proxy | Set whether or not to use the proxy server. *2 |
| Obtain Setting File- <br> Connection Time-out | Set the time out period to connecting to the server. |
| Polling Settings | Set the polling period or date and time for obtaining the update list. |
| Repeat Interval | Set the period for retrying when failed to obtain. |

- *1: Specify the folder in which S_UpdateList.csv is stored. Refer to "Machine Auto Update setting - Procedures for using the Auto Update function" for details.
- *2: If [ON] is selected, set the proxy with [Administrator Settings] -> [Network Settings] -> [Machine Update Settings] -> [HTTP Proxy Settings].
In case of the distribution server (SMB)

## NOTE

- The distribution server (SMB authentication) will not be used.

In case of the distribution server (HTTP)

| User Name | Set the user name used to access the relay server by http protocol. |
| :--- | :--- |
| Password | Set the password that is used to access the http server. |

NOTE

- Be sure not to forget the password used to access the http server. It is required for reset.

### 5.31.10 Machine Auto Update setting - Procedures for using the Relay server function

(1) Outline

- "Relay Server" is the function, which shares the update data (relay data) obtained from the network with the other MFP, and works as the program server of the "Auto Update" function.
NOTE
- This function is disabled when the Marketing Area of the service mode is set to US or Others5.
(2) Service environment
- The following conditions are necessary for using the relay server function.
- The main body is connected to such a network environment that the update data can be downloaded on the network using the http protocol.
- The relay server function will not operate under the following conditions.
- Main power switch is set to OFF.
- Sub power auto OFF mode (power key is orange) or ErP auto power OFF mode (power key flashes orange) enabled
- When [Administrator Settings] -> [Security Settings] -> [Enhanced Security Mode] is set to "ON".

## (3) Preparations

- For using this function effectively, before executing the following procedures contact with the administrator to obtain an agreement.
- Set the network parameter, program server address as well as firewall address to the MFP main body.
- Create one set of data used to the auto update function as the relay data, and store it in the program server.

Refer to "Machine Auto Update setting - Procedures for using the Auto Update function" for more information.)

- Create a data update information file (S_UpdateList.csv) and store up to four folders (four types) of data set in the program server for managing the relay data saved on one relay server machine.
(a) Methods for creating the data update information file (S_UpdateList.csv)
- To create a CSV file by specifying the model name, data update date and time, and path for accessing the update data folder used to the Auto Update function as shown below.
- The data with changed date and time will be downloaded.
- Specify up to four (four types) folders of relay data set.

A sample of S_UpdateList.csv

| A | B | C |  |
| :--- | :--- | :--- | :--- |
| 1 | bizhubXXX Standard | YYYY/MM/DD hh:mm:ss | download/bizhubXXX |
| 2 | bizhubXXX Customer1 | YYYY/MM/DD hh:mm:ss | download/bizhubXXX-1 |
| 3 | bizhubXXX Customer2 | YYYY/MM/DD hh:mm:ss | download/bizhubXXX-2 |
| A | Model name (any character string) |  |  |
| row |  |  |  |
| B <br> row | Data update date and time |  |  |
| C | Path for accessing the update data folder used to the Auto Update function |  |  |
| row |  |  |  |

(b) Configuration of files and folders

- The folder configuration of the sample of S_UpdateList.csv is as shown below.

(4) Download the relay data

1. Select [Service Mode] -> [Machine Update Setting] -> [Machine Auto Update setting] -> [Relay server setting]
2. Touch [Update File Download], then select [ON].
3. Select [Obtain Setting File].
4. Enter the information to access the program server on the setting screen.

At this time, specify the folder on URL, in which S_UpdateList.csv is stored.
5. Set [Polling Interval].
6. Set [Repeat Interval].
7. Select [Distribution Server (HTTP)], then select [ON].
8. Set the information for accessing the distribution server.

NOTE

- Do not use [SMB Authentication].
- The MFP confirms the data update information file in the program server with an interval set at [Polling Interval].
- The MFP compares the data update information file in the program server with that in the MFP, and starts downloading the relay data with a changed update date and time.
- The downloaded relay data is to be stored in a HDD.
(a) Error code
- The error code can be displayed using [Service Mode] -> [Machine Update Setting] -> [Machine Auto Update setting] -> [Relay Server Log Confirmation], or viewed on the PC where the log which saves up to 100 records sent by using [Transmission Server Log] is received.

| Error code | Cause of error | Countermeasure |
| :--- | :--- | :--- |
| N00107 | • Cannot access the HTTP server | - Set the IP address of the server or the server name correctly. <br> - Confirm that if the server runs normally. |
| N00401 | - Authentication error | - Set the ID and the password correctly. |
| N00404 | - Cannot obtain S_UpdateList.csv <br> - Cannot find the data described in <br> S_UpdateList.csv | - Confirm that if S_UpdateList.csv is stored in the server, and set the file path <br> - for accessing S_UpdateList.csv correctly. |

(5) Download the update data opened from the relay server by using the Auto Update function on the other MFP

- The following settings is to be configured on the MFPs other than the relay server, and the models corresponding to the relayed data.

1. Select [Service Mode] -> [Machine Update Setting] -> [Machine Auto Update setting] -> [Auto Update setting].
2. Select either [Server 1 settings] or [Server 2 settings] as the connection to configure.
3. Touch [Auto Update], then select [ON].
4. Select [Download Protocol], then select [HTTP] according to the settings of [Distribution Server] for the relay server.
5. Enter the information for accessing the relay server on the setting screen of the HTTP setting.

At this time, specify the folder* in which C_UpdateList.ini is stored at where to be accessed.
6. Touch $[\mathrm{OK}]$.
7. Touch [Common Settings].
8. Set [Update Time].
9. Set [Polling Interval].
10. Set [Repeat Interval].
*: The file path in which a file is stored shall be set as shown below.
[URL]: http://IP address or host name of MFP to become the relay server/DAV/Service/download/bizhubXXX (in the case of the sample of S_UpdateList.csv)
File paths are case sensitive, so enter the portion after "DAV/Service/" exactly is it appears in the C column in S_UpdateList.csv.
If activate the relay server function in Administrator settings, the file path will be changed as "/DAV/Admin/".

### 5.31.11 Machine Auto Update setting - Transmission log Update

- The log file saves up to 100 records.
- Save the log related to machine auto update, and send it to the specified location.
- Configure settings for the transmission protocol.
(1) Default setting
- OFF
(2) Setting item
- ON
- OFF
(3) Procedure
- If $[O N]$ is selected, configure the following settings.
(a) When SMB is set for the transmission protocol

| Host Name | Set the host name for the SMB server. |
| :--- | :--- |
| File Path | Set the file path used for SMB server communication. |
| User Name | Set the user name used to access the SMB server. |
| Password | Set the password used to access the SMB server. |

(b) When WebDAV is set for the transmission protocol

| URL | Set the address of the WebDAV server. |
| :--- | :--- |
| User Name | Set the user name used to access the WebDAV server. |
| Password | Set the password used to access the WebDAV server. |
| Proxy | Set whether or not to use the proxy server. *1 |

- *1: If [ON] is selected, set the proxy with [Administrator Settings] -> [Network Settings] -> [Machine Update Settings] -> [HTTP Proxy Settings].

### 5.31.12 Machine Auto Update setting - Transmission Server Log

- The log file saves up to 100 records.
- Save the log related to the update relay data download at relay server, and send it to the specified location.
- Configure settings for the transmission protocol.
(1) Default setting
- OFF
(2) Setting item
- ON
- OFF
(3) Procedure
- If $[O N]$ is selected, configure the following settings.
(a) When SMB is set for the transmission protocol

| Host Name | Set the host name for the SMB server. |
| :--- | :--- |
| File Path | Set the file path used for SMB server communication. |
| User Name | Set the user name used to access the SMB server. |
| Password | Set the password used to access the SMB server. |

(b) When WebDAV is set for the transmission protocol

| URL | Set the address of the WebDAV server. |
| :--- | :--- |
| User Name | Set the user name used to access the WebDAV server. |
| Password | Set the password used to access the WebDAV server. |
| Proxy | Set whether or not to use the proxy server. *1 |

- *1: If [ON] is selected, set the proxy with [Administrator Settings] -> [Network Settings] -> [Machine Update Settings] -> [HTTP Proxy Settings].

### 5.31.13 Machine Auto Update setting - Update Log Display

(1) Use

- To check the log related to the file download of the machine auto update.
- The latest five logs can be checked.

### 5.31.14 Machine Auto Update setting - Relay Server Log Confirmation

(1) Use

- To check the log related to the file download of the relay server.
- The latest five logs can be checked.

### 5.31.15 Machine Auto Update setting - Manual Update

- This is displayed when [Auto Update] is set to [ON] in [Service Mode] -> [Machine Update Setting] -> [Machine Auto Update setting] -> [Auto Update setting], and the update file has been downloaded in HDD.
(1) Use
- To execute update manually by using the downloaded file.
(2) Procedure

1. Touch [Manual Update] -> [Start] to start update.

## NOTE

Do not set the main power switch to OFF under the following state.

- It takes about 45 seconds from touching [Manual Update] -> [Start] to the next operation of the MFP (Auto Power OFF).
- About one minute after the download completed screen being displayed, the MFP will restart.
- When rewriting configuration files followed by the firmware, the MFP will restart again.

### 5.31.16 Machine Auto Update setting - Machine Import setting

- This is displayed only when Switch No. "72" is set to "04" in HEX Assignment in [Service Mode] -> [System 2] -> [Software Switch Setting]. NOTE
- In the following conditions, import of machine setting data is prohibited.
- [Administrator Settings] -> [Security Settings] -> [USB Connection Permission settings] is set to [Restrict].
- [Administrator Settings] -> [Security Settings] -> [USB Connection Permission settings] -> [Detail Setting] -> [External

Memory (Service)] is set to [Restrict].

- [Administrator Settings] -> [Security Settings] -> [Enhanced Security Mode] is set to [ON].
(1) Use
- To import all importable files those are saved in the root folder of the USB memory.

| Importable setting file |  |
| :--- | :--- |
| Remote Access Setting | File name |
| User Settings | UsbExportData_Csrc.dat |
| Service Settings | UsbExportData_Utility.dat |
| Authentication customize data *2 | UuthCustomMaster_***.xml |
| Address Book *1 | UsbExportData_Addr.dat |
| Authentication Data *1 | UsbExportData_Auth.dat |
| Network Settings *1 | UsbExportData_Net.dat |
| Administrator Settings *1 | UsbExportData_Admin.dat |
| Display Custom Settings *1 | UsbExportData_Topmenu.dat, TopMenuGadget.tar |
| External Cert *1 | UsbExportData_ExtCertificates.tar |
| Box configuration information *1 | UsbExportData_BackUpBoxConf***.dat |
| Accessibility setting *1 | UsbExportData_Universal.dat |
| Custom Settings *1 *2 | UsbExportData.dat |

 [Administrator Settings] -> [Security Settings] -> [Maintenance Mode Access] is set to [Allow].

- *2: This file can be imported without inputting password, because it is not encrypted.
(2) Procedure

1. Select [Service Mode] -> [Machine Update Setting] -> [Machine Auto Update Setting] -> [Machine Import Setting].
2. Insert the USB memory into the USB port.
3. Enter a password.
4. Touch [Start].

NOTE
" "OK" appears on the item that is imported successfully.
" "NG" appears on the item where the password is mismatched or an error occurred.
" "-" appears when no importable file is saved in the USB memory.
5. Follow the message appearing on the screen and turn OFF and ON the main power switch. NOTE
" If no "OK" appears in the import result, no message will be displayed.

### 5.31.17 Machine Auto Update setting - Machine Export setting

NOTE
In the following conditions, export of machine setting data is prohibited.

- [Administrator Settings] -> [Security Settings] -> [USB Connection Permission settings] is set to [Restrict]
- [Administrator Settings] -> [Security Settings] -> [USB Connection Permission settings] -> [Detail Setting] -> [External Memory (Service)] is set to [Restrict].
- [Administrator Settings] -> [Security Settings] -> [Enhanced Security Mode] is set to [ON].
(1) Use
- Output the main unit configuration in XML format to a USB memory device or the SMB folder in the main unit.
(a) Target items to be exported are as follows
- Remote Access Setting
- User Settings
- Service Settings (Excluding the setting of Software switch and Engine FW DipSW)
- Address Book*
- Authentication Data*
- Network Settings*
- Administrator Settings*
- Display Custom Settings*
- External Cert (which is retained)*
- Box configuration information*
- Accessibility setting*
- Authentication customize data

NOTE

- *: It will be displayed when [Service Mode] -> [System 2] -> [ $\square$ ] -> -> [ $\square$ ] -> [Maintenance Mode] is set to "Effective and [Administrator Settings] -> [Security Settings] -> [Maintenance Mode Access] is set to [Allow]."
(2) Procedure

1. Select [Service Mode] -> [Machine Update Setting] -> [Machine Auto Update Setting] -> [Machine Export Setting]
2. Select the item to be output.
3. Select either [USB] or [SMB] as the [Export Destination]. *1 If you select [USB], connect a USB memory device to a USB port.
4. Enter a password. *2
5. Touch [Start].
6. [Result: OK] will be displayed.
7. Complete the data export. *3

NOTE

- *1: [SMB] displays if the following settings are made.
- [Administrator Settings] -> [Network Settings] -> [SMB Settings] -> [SMB Server Settings] -> [Share SMB File Setting] -> [ON]
- [Service Mode] -> [System 2] $->$ [HDD] $->$ [Installed]
- *2: If an XML file is to be used on the Auto Update function, register the same password beforehand to the MFP where a data is to be downloaded as [Machine Update Password].
- *3: When [SMB] is selected, the data is exported to the SMB folder of this machine.

Check of the SMB folder: <br>(IP address)/FWData_out\$
If [ON] is selected for [CE Authentication], "User Name" and "CE Password" are required to access the folder.

- User Name: CE
- Password: CE Password

### 5.31.18 Machine Auto Update setting - Machine Update Password

(1) Use

- To set a password used to decrypt the update file of the machine.
(2) Procedure
- Enter the decryption password using the on-screen keyboard.

1. Current Password: Enter the currently used decryption password (only when the decryption password has been set).
2. New Password: Enter the new decryption password.
3. Re-enter New Password: Enter the new decryption password.

## NOTE

- Be sure not to forget the decryption password. It is required for reset.

### 5.31.19 Firmware Rollback

NOTE

- This function is available when [Installed] is set for [Service Mode] -> [System 2] -> [HDD].
- If there is no backed up firmware, the firmware version will not be displayed. For details, see "Creating back up files when updating firmware".

## (1) Firmware Rollback

(a) Use

- To be used when rewriting to the backed up firmware.
- To be used when error occurs at the time of firmware updating.
(b) Procedure

1. Check the version of the firmware to be rewritten.
2. Touch [Start].
3. A reboot is started.
4. Following the reboot, a firmware update screen appears. Then, check the version of each firmware.
5. Turn OFF and ON the main power switch.
6. Make sure that a message notifying the completion of the firmware rollback appears. Then, touch [OK].
(2) Open Mode Settings
(a) Use

- To set whether to display/hide [Firmware Rollback] when selecting [Administrator Settings] -> [Network Settings] -> [Machine Update Settings].
- Even an administrator can rewrite to the backed up firmware.
(b) Default Setting
- Set
(c) Setting item
- Set
- Unset

### 5.31.20 Copy Network Settings

(1) Use

- To deliver the network-related information saved in the USB memory to, and set it in, other MFPs.
- One MFP is an originating side that delivers the network connection setting values to other MFPs within the same network.
- Setting values described in the CSV file and associated with the serial number of the recipient MFP are delivered and set.

| $[1]$ | CSV file containing setting values for network connection | $[2]$ | USB memory |
| :--- | :--- | :--- | :--- |
| $[3]$ | Connection | $[4]$ | Recipient MFP |
| $[5]$ | Delivering and setting values of recipient MFP (serial <br> No.1) | $[6]$ | Delivering and setting values of recipient MFP (serial <br> No.2) |
| $[7]$ | Delivering and setting values of recipient MFP (serial <br> No.X) | $[8]$ | Recipient MFP (serial No.1) |
| $[9]$ | Recipient MFP (serial No.2) | $[10]$ | Recipient MFP (serial No.X) |

## (2) Environmental preparations

- It is necessary to set and prepare in advance the originating MFP, recipient MFPs, USB memory, and the CSV file that describes the network settings.
- Perform the preparation procedure by following the steps given below.

## (a) Setting the originating MFP

- Check that the originating MFP and the recipient MFP are connected to the same network (segment).
- Set a fixed IP address in the originating MFP.
- Set [Administrator Settings] -> [System Connection] -> [OpenAPI Settings] -> [Access Setting] to "Allow".
- Set [Administrator Settings] -> [System Connection] -> [OpenAPI Settings] -> [External Application Connection] to "Yes".

## (b) Setting the recipient MFP

- Check that the originating MFP and the recipient MFPs are connected to the same network (segment).
- Check that the TCP/IP setting of the recipient MFP is enabled to permit network communications.
- Check that a serial number is set in the MFP.
- Set all settings in [Administrator Settings] -> [System Connection] -> [OpenAPI Settings] to the default values.
(c) USB memory

The following shows the requirements for the USB memory to be used for copying in the network settings:

- USB flash memory compatible with the USB (1.1/2.0) interface
- The USB memory is formatted in FAT32 format.
- No security functions such as encryption and password lock have been added (or the USB memory allows its security functions to be turned OFF).
- A USB memory that is recognized by the computer as two or more drives cannot be used.
- Use any write-protected USB memory in the write-enabled condition.
(d) CSV file
- Appropriate the format of the CSV file, and prepare a CSV file where the recipient MFP and network setting value to be delivered and set have been input.
Setting item: Corresponding to the "Column" of a CSV file format
Setting value of recipient MFP: Corresponding to the "row" of a CSV file format
NOTICE
- CSV file format (PeculiarConfig.xls)

Procedure

1. Enter the serial number and the IP address v4 validation method.
2. Enter the other setting details in accordance with the CSV file format.

For items that can be delivered and set and the detailed descriptions, see the CSV file format.
3. Enter the setting value of one recipient MFP against one row. And to set multiple MFPs, create setting value for each MFP while adding rows from top in order.
NOTE

- The serial number and the IP address v4 validation method should invariably be entered.
- In any items left blank in the file, the items set in the MFP are automatically set.
" The file name should read "PeculiarConfig" with an extension of CSV.
- All MFPs having serial numbers contained in the CSV file will be the recipient MFPs. If any MFP that is to be excluded is included in the network, do not include the serial number of such an MFP in the file.
- Even when the serial number of the originating MFP is included in the CSV file, the originating MFP is not a recipient MFP.
- Up to 255 MFPs are recognized as the recipient MFP. Any serial numbers of the 256th MFP and onward contained in the CSV file will be excluded from the recipient MFPs.

## (3) Procedure

1. Prepare a CSV file (PeculiarConfig.csv) that describes the setting values to be delivered.
2. Store the CSV file immediately under the root directory of the USB memory and connect to the originating MFP.
3. Call the Service Mode to the screen.
4. Touch [Machine Update Setting] -> [Copy Network Settings] -> [Connection Timeout].
5. Set Connection Timeout and touch [OK].

Default value: 30 Sec
Setting range: 1 to 300 Sec
6. Touch [Machine Update Setting] -> [Copy Network Settings] -> [Copy Setting] -> [Check Connection] -> [Start].
7. Check the number of MFPs displayed at "Result" against the number of MFPs displayed "OK".
8. Touch [Copy] -> [Start]. This delivers the setting value information to the recipient MFPs one by one. NOTE

- Screen operations are displayed in the MFP in which the setting values are being rewritten.
- Do not remove the USB memory until the procedure is completed.

9. When the delivery of the setting values to all recipient MFPs and rewriting of the setting values in all recipient MFPs are completed, the recipient MFPs are restarted.
10. The CSV file (PeculiarConfig_Result.csv) that contains the delivery result is stored in the USB memory inserted in the originating MFP.
11. Check the delivery result file in the USB memory to thereby determine that the procedure has been normally terminated.

## NOTE

- When an error that disables continued delivery occurs, a corresponding error code appears on the control panel.
- When a delivery error occurs in any of the recipient MFPs, a message appears that prompts a check of the delivery result file.
- For details of the delivery error, check the specific details of the delivery result file.

| Error code |  |
| :--- | :--- |
| $N^{* * * * *}$ | Communication error |
| E00001 | The USB memory is not connected to the originating MFP. |
| E00002 | The CSV file in the USB memory cannot be read. |
| E00003 | The delivery result file cannot be created in the USB memory connected to the originating MFP. |
| E00004 | The CSV file format is illegal. |
| E00005 | Communication is not successful with an MFP having a serial number contained in the CSV file. |
| E00006 * | "Restrict" is set in [OpenAPI Settings] -> [Access Setting]. |
| E00007 * | "ON" is set in [OpenAPI Settings] -> [Authentication]. |
| E00008 * | "SSL Only" or "SSL/Non-SSL" is set in [OpenAPI Settings] -> [SSL/Port Settings]. |
| E00009 * | Any data other than "50001" is set in [OpenAPI Settings] -> [SSL/Port Settings]. |
| E00010 * | "No" is set in [OpenAPI Settings] -> [External Application Connection]. |
| E00011 | No response is received from the recipient MFP even after the lapse of a predetermined period of time <br> after the CSV file has been delivered. (timeout error) |
| E00012 | The recipient MFP is not at timing at which it can accept the OpenAPI message. |
| E00013 | The recipient MFP fails in updating. |
| E00014 | "Cancel" is selected during delivery. |
| E00015 | The USB memory is removed from the originating MFP during delivery. |
| E00016 | A serial number in the CSV file is illegal. |
| E00099 | A network system error. Any of the network settings is not the default value. |

- *: Check the settings in the originating MFP when the error code appears on the control panel; check the settings in the recipient MFP when the error code is included in the delivery result file.

## 6. SETUP WIZARD

### 6.1 Function outline

- Use of the Setup Wizard function allows those items that need to be set during the setup procedure to be extracted from the Service Mode and set.
- This enables efficient selection and setting of Service Mode functions during the setup procedure.

## NOTE

" The specific function may be set either via the "Service Mode" or the "Setup Wizard". The setting made last is the valid setting.

### 6.1.1 Setup Wizard list

| Setup Wizard | Ref. page |
| :--- | :--- |
| Time Zone Setting/Date \& Time Setting | Time Zone/Date \& Time Input mode |
| Serial Number | Serial Number |
| Unit Change/Warning display | Unit Change |
| List Output | List Output |

### 6.2 Starting/Exiting

### 6.2.1 Starting procedure

1. Call the Service Mode to the screen.
2. Press the following keys in this order.

- Stop -> 3

3. Touch the [Prev.] key or [Next] key to select the mode.

Exsample

### 6.2.2 Exiting procedure

1. Touch [Service].

The home Service Mode screen reappears.
2. Touch [Exit].
3. Turn OFF the main power switch. Wait 10 seconds, then turn ON the main power switch again.

## 7. ENHANCED SECURITY

### 7.1 List of Enhanced Security

| Enhanced Security | Ref. page |
| :--- | :--- |
| CE Password | I.7.3.1 CE Password |
| Administrator Password | I.7.3.2 Administrator Password |
| Administrator Feature Level | I.7.3.3 Administrator Feature Level |
| CE Authentication | I.7.3.4 CE Authentication |
| Life Stop Setting | I.7.3.5 Life Stop Setting |
| Memory Data Backup | I.7.3.6 Memory Data Backup |
| operation Ban release time | I.7.3.7 operation Ban release time |
| Administrator unlocking | I.7.3.3 Administrator unlocking |
| Engine FW DipSW | I.7.3.9 Engine FW DipSW |
| Engine Data Backup | I.7.3.10 Engine Data Backup |
| HDD Data Backup | I.7.3.11 HDD Data Backup |
| Data Backup | I.7.3.12 Data Backup |
| ADF Data Backup | I.7.3.13 ADF Data Backup |
| Customer Type | I.7.3.14 Customer Type |
| TPM Setting | I.7.3.15 TPM Setting |

### 7.2 Starting/Exiting

### 7.2.1 Starting procedure

1. Call the Service Mode to the screen.
2. Press the following keys in this order.

- Stop -> 0 -> Clear

3. Select a mode.

### 7.2.2 Exiting procedure

1. Touch [Exit].
2. Turn OFF the main power switch. Wait 10 seconds, then turn $O N$ the main power switch again.

### 7.3 Enhanced Security

### 7.3.1 CE Password

(1) Use

- To set and change the CE password.
- The CE password needs to be 8 to 64 one-byte alphameric characters and symbols.
(2) Default setting
- 9272927292729272
(3) Procedure
- Enter the CE password (8 digits) on the on-screen keyboard.

1. Current Password: Enter the currently using CE password.
2. New Password: Enter the new CE password.
3. Re-Input Password: Enter the new CE password again.

## NOTE

- When [Administrator Settings] -> [Security Settings] -> [Security Details] is set to [ON], new passwords cannot contain the same string of characters nor can be previous passwords be used.
- A new password is set when starts from the service mode after changing.
- NEVER forget the CE password. When forgetting the CE password, call responsible person of KM.

### 7.3.2 Administrator Password

(1) Use

- To set and change the administrator password.
- Use this function when the administrator forget the administrator password because a new password can be set without entering the current administrator password with this.
- The administrator password needs to be 8 to 64 one-byte alphameric characters and symbols.
(2) Default setting
- 1234567812345678
(3) Procedure
- Enter the administrator password on the on-screen keyboard.

1. New Password: Enter the new administrator password.
2. Re-Input Password: Enter the new administrator password again.

## NOTE

- When [Administrator Settings] -> [Security Settings] -> [Security Details] is set to [ON], new passwords cannot contain the same string of characters nor can be previous passwords be used.

### 7.3.3 Administrator Feature Level

(1) Use

- To set which modes to be allowed for the administrator to use in Service Mode.
- Use when allowing the administrator to use some modes in Service Mode.
- The modes allowed for the administrator to use in each setting are as follows.

| Administrator settings function |  |  |  | Level 1 | Level 2 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| System Settings | Expert Adjustment | Printer Adjustment | Erase Leading Edge | - | $\bigcirc$ |
|  |  |  | Paper Feed Direction Adj. | - | $\bigcirc$ |
|  |  | Scanner Area | Scanner Adjustment: Leading Edge | - | $\bigcirc$ |
|  |  |  | Scanner Adjustment: Centering | - | $\bigcirc$ |
|  |  |  | Horizontal Adjustment | - | $\bigcirc$ |
|  |  |  | Vertical Adjustment | - | $\bigcirc$ |
|  |  | ADF Adjustment | Centering | - | $\bigcirc$ |
|  |  |  | Original Stop Position | - | $\bigcirc$ |
|  |  |  | Centering Auto Adjustment | - | $\bigcirc$ |
|  |  |  | Auto Adj. of Stop Position | - | $\bigcirc$ |
|  |  | User Paper Settings |  | - | $\bigcirc$ |
|  | Standard Size Setting | Original Glass Original Size Detect |  | - | $\bigcirc$ |
|  |  | Foolscap Size Setting |  | - | $\bigcirc$ |

## (2) Default setting

- Prohibit
(3) Setting item
- Level 1
- Level 2
- Prohibit

### 7.3.4 CE Authentication

- If [Administrator Settings] -> [Security Settings] -> [Security Details] -> [Password Rules] is "Enable", "OFF" in the setting item is not displayed.
- It will not be displayed when [Administrator Settings] -> [Network Settings] -> [Remote Panel Settings] -> [Client Settings] is set to "ON."
(1) Use
- To determine whether or not to authenticate CE password as entering Service Mode.

## NOTE

" For setting the [Password Rules] to "ON", set the CE Authentication to "ON".
Change the initial CE password beforehand.
" Before setting the [Remote Panel Settings] to "ON", set the CE Authentication to "ON".
(2) Default setting

- ON
(3) Setting item
- ON
- OFF

### 7.3.5 Life Stop Setting

(1) Life stop
(a) Use

- To select whether or not to stop a print cycle when the drum unit, developing unit, transfer belt, and fusing unit reach its service life. NOTE
- The settings of software Dip switch No. 227 (bit7) and switch No. 230 (bit3) have priority.
(b) Default setting
- Off (For Japan, North America and Europe)
- Enable (For others)
(c) Setting item
- Enable
- Off

## (2) Life warning display

(a) Use

- Select whether to display or not display the pre-near life warning, near life warning, life warning, life stop warning, and L-call warning. Warning statuses are not displayed for units in which this setting is set to [Do not display] even if each warning status is enabled.
- Applicable units: drum unit, developing unit, transfer belt, and fusing unit

NOTE

- The settings of software Dip switch No. 227 (bit7) and switch No. 230 (bit3) have priority.
(b) Default setting
- Off (For Japan, North America and Europe)
- Enable (For others)
(c) Setting item
- Enable
- Off

### 7.3.6 Memory Data Backup

(1) Use

- To backup the data stored in the memory region on the MFP board to the flash memory.
- To backup current data in order to prevent data in the memory region on the MFP board from being erased unexpectedly.
- To backup data manually. It usually makes backup every hour automatically.
- Backup data can be restored by following the specified procedure when the trouble (CD3XX) occurred.
- Refer to "TROUBLESHOOTING" for details on restoration procedure.

## (2) Procedure

1. Touch [Memory Data Backup].
2. Touch [Start] to start making a backup.
3. Check the message [Backup is completed.], and turn main power switch OFF. Wait for ten seconds or more and turn main power switch back ON.

### 7.3.7 operation Ban release time

(1) Use

- To set the time that elapses before the machine releases an access lock that is activated after the CE password authentication.
- To set the period of time that elapses before the machine releases the access lock, which aims to prevent the unintentional release of the access lock.
- After the CE password authentication, if the access lock is activated, the lock release timer starts to operate the following procedures.

1. Main power switch is turned OFF and ON.
2. Menu -> [Counter] -> [Print List]
3. Touch [Display Keypad], displaying 10-key pad.
4. The lock release timer starts to operate by input the Stop -> 0 -> 9 -> 3 -> 1 -> 7 .
5. When the timer reaches the time specified in this setting, the access lock is released.
(2) Default setting

- 5 (minutes)
(3) Setting range
- 1 to 60 (minutes)

## NOTE

- When Enhanced Security Mode is set to ON in [Administrator Settings] -> [Security Settings] -> [Enhanced Security Mode], the period of time that can be set in this setting is 5 minutes or more.

### 7.3.8 Administrator unlocking

(1) Use

- To release an access lock that is activated after an administrator password authentication.
- To release the access lock with service authority when an administrator password authentication fails and the access lock is activated.
- When the main power switch is turned OFF and ON or the period of time set in the Release Time Settings elapses, the machine releases the access lock that is activated after the administrator password authentication. In addition to these operations, this setting provides another way to release the access lock.
(2) Procedure

1. Touch [Administrator unlocking].
2. Touch [unlocking] to release an access lock.
3. When $[\mathrm{OK}]$ is displayed, touch $[\mathrm{OK}]$.

### 7.3.9 Engine FW DipSW

(1) Use

- To make printer engine settings.
- The following table shows DIP switches that can be set in this machine.

| Switch No. | Function |
| :---: | :--- |
| 1 | Not used |
| 2 | Not used |
| 3 | New Release Disable mode |
| 4 | Choice of alternative temperature control print prohibition (bizhub C658/C558) |
| 5 | Choice of high humidity circumstance (bizhub C458/C368/C308/C258) |
| 6 | Choice of warm-up completion temperature (bizhub C458/C368/C308/C258) |
| 7 | Choice of photo conductor pre-rotation time (bizhub C368/C308/C258) |
| 8 | Choice of 2nd image transfer output table |

| Switch No. | Function |
| :---: | :---: |
| 9 | Choice of paper size detection at bypass tray |
| 10 | Not used |
| 11 | Choice of fusing roller rotation while waiting |
| 12 | Not used |
| 13 | Choice of securing fusibility (bizhub C458/C368/C308/C258) |
| 14 | Choice of unit simultaneous replacement promotion |
| 15 | FS-534/PK-520 Punch operation noise suppression choice (bizhub C368/C308/C258) |
| 16 | Not used |
| 17 | Choice of switching main tray full detection methods |
| 18 | Choice of FS-533 tray home position switching/FS-534 main tray position lowering/FS-534 main tray position lowering |
| 19 | Choice of custom-size paper detection |
| 20 | Choice of drum unit (C/M/Y/K) life threshold (used in combination with Engine FW DipSW No.52) |
| 21 | Choice of drum unit slight rotation (bizhub C368/C308/C258) |
| 22 | Choice of main scan direction white line correction |
| 23 | Choice of photo conductor pre-rotation time |
| 24 | Choice of continuous temperature control after printing |
| 25 | ACS parameter choice |
| 26 | Choice of printing pause time during temperature increase inside the machine |
| 27 | Not used |
| 28 | Choice of fusing mode for index paper (bizhub C658/C558) |
| 29 | Rotation choice of developing unit/K |
| 30 |  |
| $\begin{gathered} 31 \\ : \\ 36 \end{gathered}$ | Not used |
| 37 | Silent mode choice (bizhub C658/C558/C458) |
| 38 |  |
| $\begin{gathered} 39 \\ : \\ 46 \\ \hline \end{gathered}$ | Not used |
| 47 | Replacement timing Intelligent Control of Developing unit |
| 48 | Replacement timing Intelligent Control of Transfer Roller Unit |
| 49 | Replacement timing Intelligent Control of Transfer Belt Unit |
| 50 | Replacement timing Intelligent Control of Drum unit |
| 51 | CSRC Extension Data Notification function |
| 52 | Choice of drum unit (C/M/Y/K) life threshold (used in combination with Engine FW DipSW No.20) |
| 53 $54$ | Not used |
| 55 | Shut-down control of PPM for 15A breaker (when 15A plug is used on bizhub C658 for NA) |
| 56 | Not used |

## (2) Procedure

1. Touch [Engine FW DipSW].
2. Touch the key that corresponds to the switch No. of the function to be set and check the key is highlighted (ON state) in reverse video.
3. Touch [OK].

## (3) Details of Each Function

(a) New Release Disable mode

- To enable a unit that is temporarily used for troubleshooting or other purposes to be used again as a new unit in another machine, New Release Disable mode is provided.
- Applicable units are the following units that have the new unit detection feature. Drum unit/Y, M, C, K, Developing unit/Y, M, C, K
- When the New Release Disable mode is set, the parameter of the unit before replacement is used without making automatic adjusting control with the TCR sensor and new image stabilization control.
Procedure

1. Open the front door.
2. Call the Service Mode to the screen
3. Call the Enhanced Security to the screen
4. Touch [Engine FW DipSW].
5. Touch [3] and check the key is highlighted (ON state) in reverse video.
6. Touch [END].
7. Close the front door.

By closing the front door, the New Release Disable mode takes effect.
I.7.3.9 (4) Notes when using the New Release Disable mode
(b) Choice of alternative temperature control print prohibition (bizhub C658/C558)

- To set whether to allow a print cycle to be run when condensation is detected at the fusing section.

| OFF | Disables the alternative temperature control, so that no print cycle can be run until condensation is eliminated at the <br> fusing section. (Default) |
| :--- | :--- |
| ON | Enables the alternative temperature control. During performance of the alternative temperature control, a print cycle can <br> be run, but productivity is reduced to $50 \%$. It should be noted that the image quality during the performance of the <br> alternative temperature control falls outside the image quality guaranteed range. |

Procedure

1. Call the Service Mode to the screen.
2. Call the Enhanced Security to the screen.
3. Touch [Engine FW DipSW].
4. Touch [4] and check the key is highlighted (ON state) in reverse video.
5. Touch [END].
(c) Choice of high humidity circumstance (bizhub C458/C368/C308/C258)

- Out of Fusing PPM control for preventing the paper from losing its fusibility, "high humidity circumstance mode" which controls paper curling in high humidity is prohibited.

| OFF | • Run "High-humidity Mode" in high-humidity environments. |
| :--- | :--- |
|  | - Longer warm-up time, but no occurrence of curl even under high humidity environment (Default) |
| ON | - Unable to run "High-humidity Mode" even in high-humidity environments. |
|  | - Shortens the warm-up time in high humidity environments, but there is a risk of paper curl occurring. |

Procedure

1. Call the Service Mode to the screen.
2. Call the Enhanced Security to the screen.
3. Touch [Engine FW DipSW].
4. Touch [5] and check the key is highlighted (ON state) in reverse video.
5. Touch [END].
(d) Choice of warm-up completion temperature (bizhub C458/C368/C308/C258)

- To set the fusing temperature at the time of black printing.
- It controls the occurrence of a fusing error at the time of black printing on paper recommended to EU regions.

| OFF | • Temperature control for regions other than EU (Default) |
| :--- | :--- |
| ON | • Temperature control for EU regions |

Procedure

1. Call the Service Mode to the screen.
2. Call the Enhanced Security to the screen.
3. Touch [Engine FW DipSW].
4. Touch [6] and check the key is highlighted (ON state) in reverse video.
5. Touch [END].
(e) Choice of photo conductor pre-rotation time (bizhub C368/C308/C258)

- To set the pre-rotation time of the photo conductor.
- It controls the occurrence of void areas when being left for long time.

| OFF | • Photo conductor pre-rotation time: Short (priority on warm-up time reduction: Default) |
| :--- | :--- |
| ON | • Photo conductor pre-rotation time: Long (priority on image quality) |

Procedure

1. Call the Service Mode to the screen.
2. Call the Enhanced Security to the screen.
3. Touch [Engine FW DipSW].
4. Touch [7] and check the key is highlighted (ON state) in reverse video.
5. Touch [END].

## (f) Choice of 2nd image transfer output table

- To set the 2nd image transfer output table when printing on plain paper.
- If the 2 nd image transfer output is insufficient, "void areas" will occur on a printed image. In that case, set "2nd image transfer output table 2" to finely adjust the transferring output.
- If the 2nd image transfer output is excessive, "white spots" will occur on a printed image. In that case, set "2nd image transfer output table 1 " to finely adjust the transferring output.

| OFF | • 2nd image transfer output table 2 (high 2nd image transfer output) (Default) |
| :--- | :---: |
| ON | • 2nd image transfer output table 1 (low 2nd image transfer output) |

Procedure

1. Call the Service Mode to the screen.
2. Call the Enhanced Security to the screen.
3. Touch [Engine FW DipSW].
4. Touch [8] and check the key is highlighted (ON state) in reverse video.
5. Touch [END].
6. Call the Service Mode to the screen.
7. Touch [Imaging Process Adjustment] -> [Transfer Voltage Fine Adj] -> [2nd Transfer Adj.].
8. Make fine adjustment of the 2nd transferring for plain paper and check the printed image.

## (g) Choice of paper size detection at bypass tray

- To set the bypass tray automatic paper size detection dedicated to metric or inch sizes depending on the applicable marketing area.
- Set the inch sizes for the US market. Set the metric sizes for any other marketing areas. NOTE
- The default setting is to disable automatic paper size detection of metric and inch sizes. To enable automatic size detection of mixed originals consisting of originals of both metric and inch sizes, set so as to enable the automatic paper size detection of metric and inch sizes.
Procedure (to enable automatic size detection of mixed originals)

1. Call the Service Mode to the screen.
2. Call the Enhanced Security to the screen.
3. Touch [Engine FW DipSW].
4. Touch [9] and check the key is highlighted (ON state) in reverse video.
5. Touch [END].
(h) Choice of fusing roller rotation while waiting

- It sets whether to constantly rotate the fusing motor or not while waiting the job for MFP.

| OFF | The fusing motor stops after 30 minutes in waiting condition. Steadiness while waiting has a priority. (Default) |
| :--- | :--- |
| ON | The fusing motor constantly rotates while waiting. It ensures the fusibility when immediately starts printing from the <br> waiting status. |

Procedure

1. Call the Service Mode to the screen.
2. Call the Enhanced Security to the screen.
3. Touch [Engine FW DipSW].
4. Touch [11] and check the key is highlighted (ON state) in reverse video.
5. Touch [END].

## (i) Choice of securing fusibility (bizhub C458/C368/C308/C258)

- Sets whether or not to conduct printing wait for ensuring fusibility in low-temperature/low-humidity environments.

| OFF | Without printing wait (Default) |
| :--- | :--- |
| ON | With printing wait |

Procedure

1. Call the Service Mode to the screen.
2. Call the Enhanced Security to the screen.
3. Touch [Engine FW DipSW].
4. Touch [13] and check the key is highlighted (ON state) in reverse video.
5. Touch [END].

## (j) Choice of unit simultaneous replacement promotion

- To set whether or not to enable "F.5.3 Control causing inhibited printing for one part when an inhibited-printing event occurs in another part."

| OFF | To set whether or not to enable "F.5.3 Control causing inhibited printing for one part when an inhibited-printing event <br> occurs in another part." (Default) |
| :--- | :--- |
| ON | Disables "Control causing inhibited printing for one part when an inhibited-printing event occurs in another part." |

Procedure

1. Call the Service Mode to the screen.
2. Call the Enhanced Security to the screen.
3. Touch [Engine FW DipSW].
4. Touch [14] and check the key is highlighted (ON state) in reverse video.
5. Touch [END].
(k) FS-534/PK-520 Punch operation noise suppression choice (bizhub C368/C308/C258)

- The operating noise generated from the punch unit when punching holes is reduced.

| OFF | • Full punching force $(100 \%)$ of the punch motor is applied against the basic weight of all types of paper. |
| :--- | :--- | :--- |
| ON | - The punching force of the punch motor is controlled in accordance with the thickness of the paper (paper weight). <br>  <br>  <br>  <br>  <br> Control the punching force of the punch motor depending on the paper thickness (basic weight). For paper other <br> - Control the operating noise generated when punching holes on the paper other than the thick paper. |

Procedure

1. Call the Service Mode to the screen.
2. Call the Enhanced Security to the screen.
3. Touch [Engine FW DipSW].
4. Touch [15] and check the key is highlighted (ON state) in reverse video.
5. Touch [END].
(I) Choice of switching main tray full detection methods

- It sets the main tray full detection method of FS-536 or FS-537.

| OFF | Detect the main tray full status as usual without making an account of the total sheets of paper loaded in the main tray. <br> (Default) |
| :--- | :--- |
| ON | Make an account of the total sheets of paper loaded in the main tray to detect the main tray full status. |

Procedure

1. Call the Service Mode to the screen.
2. Call the Enhanced Security to the screen.
3. Touch [Engine FW DipSW].
4. Touch [17] and check the key is highlighted (ON state) in reverse video.
5. Touch [END].

## (m) Choice of FS-533 tray home position switching/FS-534 main tray position lowering/FS-536 main tray position

 lowering- It switches the tray home position when FS-533 is installed.

| OFF | Tray home position becomes the low limit position. (Default) |
| :--- | :--- |
| ON | Tray home position becomes the paper receiving position. |

- It sets the main tray is lowered after the print job ends to ease removing the exited paper from the tray when FS-534 is installed.

| OFF | Main Tray is not lowered after the print job ends. (Default) |
| :--- | :--- |
| ON | Main Tray is lowered (about 50 mm ) after the print job ends. |

- It sets the main tray is lowered after the print job ends to ease removing the exited paper from the tray when FS-536 is installed.

| OFF | Main Tray is lowered (about 50 mm ) after the print job ends. (Default) |
| :--- | :--- |
| ON | Main Tray is not lowered after the print job ends. |

Procedure

1. Call the Service Mode to the screen.
2. Call the Enhanced Security to the screen.
3. Touch [Engine FW DipSW].
4. Touch [18] and check the key is highlighted (ON state) in reverse video.
5. Touch [END].
(n) Choice of custom-size paper detection

- To enable the custom-size paper detection of the tray 1 and tray 2.

NOTE

- This function can be set only with the refresh model.
- The refresh model is set ON by default.

Procedure

1. Call the Service Mode to the screen.
2. Call the Enhanced Security to the screen.
3. Touch [Engine FW DipSW].
4. Touch [19] and check the key is highlighted (ON state) in reverse video.
5. Touch [END].
(o) Choice of drum unit (C/M/Y/K) life threshold

- To change the drum unit (C/M/Y/K) life threshold value by setting "OFF/ON".
- This setting is available when Engine FW DipSW No. 50 is set to ON.

| SW No. |  |  |
| :--- | :--- | :--- |
| 52 | 20 |  |
| OFF | OFF | Life warning at a consumption rate of $100 \%$; life stop at $120 \%$ (default) |
| OFF | ON | Life warning at a consumption rate of $110 \%$; life stop at $130 \%$ |
| ON | OFF | Life warning at a consumption rate of $120 \%$; life stop at $140 \%$ |
| ON | ON | Life warning at a consumption rate of $130 \%$; life stop at $150 \%$ |

Procedure

1. Call the Service Mode to the screen.
2. Call the Enhanced Security to the screen.
3. Touch [Engine FW DipSW].
4. Touch [20] or [52], and check the key is highlighted (ON state) in reverse video.
5. Touch [END].
(p) Choice of drum unit slight rotation (bizhub C368/C308/C258)

- It sets whether to conduct slight rotation control or not for the color photo conductor.
- When the printing is continued with lower coverage, abrasion of the photo conductor and the cleaning blade becomes large and may cause noise when slightly rotating the drum unit.
- It is used for preventing noise caused by the slight rotation of the color photo conductor.

| OFF | Conducts slight rotation control. (Default) |
| :--- | :--- |
| ON | Does not conduct slight rotation control. |

Procedure

1. Call the Service Mode to the screen.
2. Call the Enhanced Security to the screen.
3. Touch [Engine FW DipSW].
4. Touch [21] and check the key is highlighted (ON state) in reverse video
5. Touch [END].

## (q) Choice of main scan direction white line correction

- When printing is continued with lower coverage, filming may occur to the transfer belt which may cause the main scan direction white lines.
- By setting this ON, the toner will be supplied to the transfer belt by the toner patch during image stabilization to prevent white lines to occur. The toner consumption increases by using this setting. Choose the setting suitable for the user.

| OFF | Does not conduct toner patch for the white lines (Default) |
| :--- | :--- |
| ON | Conducts toner patch for the while lines |

Procedure

1. Call the Service Mode to the screen.
2. Call the Enhanced Security to the screen.
3. Touch [Engine FW DipSW].
4. Touch [22] and check the key is highlighted (ON state) in reverse video.
5. Touch [END].

## (r) Choice of photo conductor pre-rotation time

- To select whether to execute pre rotation of the photo conductor.

| OFF | Not execute pre-rotation of the photo conductor |
| :--- | :--- |
| ON | Execute pre-rotation of the photo conductor |

Procedure

1. Call the Service Mode to the screen.
2. Call the Enhanced Security to the screen.
3. Touch [Engine FW DipSW].
4. Touch [23] and check the key is highlighted (ON state) in reverse video.
5. Touch [END].
(s) Choice of continuous temperature control after printing

- To select the fusing unit temperature adjustment control performed when a print job sent from PC is completed.
- When [Administrator Settings] -> [System Settings] -> [Power Supply/Power Save Settings] -> [Enter Power Save Mode] is set to "Immediately", select whether or not to turn OFF the fusing heater immediately after a print job from PC is completed.

| OFF | The fusing heater is turned OFF immediately after printing a job sent from PC. (Default) |
| :--- | :--- |
| ON | The temperature control continues until the next sleep request is sent from the controller. |

Procedure

1. Call the Service Mode to the screen
2. Call the Enhanced Security to the screen.
3. Touch [Engine FW DipSW].
4. Touch [24] and check the key is highlighted (ON state) in reverse video.
5. Touch [END].

## (t) ACS parameter choice

- It sets the black printing quantity threshold until switching the transfer belt from all press to K press when a few pages of black printing is included in color printing.
- With the initial setting, productivity has the priority and printing is conducted with all press even when the specified quantity of black printing is included. This process shortens the life of the color drum unit due to unnecessary rotation. When this setting is ON, black printing quantity threshold until switching to K press becomes smaller. This setting is to be used when the drum unit life should have priority over productivity.

| OFF | Productivity has priority (Default) |
| :--- | :--- |
| ON | Life has priority |

Procedure

1. Call the Service Mode to the screen.
2. Call the Enhanced Security to the screen.
3. Touch [Engine FW DipSW].
4. Touch [25] and check the key is highlighted (ON state) in reverse video.
5. Touch [END].
(u) Choice of printing pause time during temperature increase inside the machine

- The printing pauses for a specified period of time in order to prevent toner from adhering when the temperature inside increases.

| OFF | Productivity has priority (Default) |
| :--- | :--- |
| ON | Pause for printing becomes longer. Temperature inside comparatively becomes low which may improve the image <br> quality. |

## Procedure

1. Call the Service Mode to the screen.
2. Call the Enhanced Security to the screen.
3. Touch [Engine FW DipSW].
4. Touch [26] and check the key is highlighted (ON state) in reverse video.
5. Touch [END].
(v) Choice of fusing mode for index paper (bizhub C658/C558)

- To set fusing temperature when printing on the index paper.
- It controls the occurrence of paper curling when printing on a thin index paper.

| OFF | Fusing temperature: High (priority on fusing ability: Default) |
| :--- | :--- |
| ON | Fusing temperature: Low (priority on controlling paper curling) |

Procedure

1. Call the Service Mode to the screen.
2. Call the Enhanced Security to the screen.
3. Touch [Engine FW DipSW].
4. Touch [28] and check the key is highlighted (ON state) in reverse video.
5. Touch [END].

## (w) Rotation choice of developing unit/K

- At the start or end of a process, reverse rotation of the transfer belt or cleaning of the $2 n d$ transfer roller, the drum unit/K rotates. (The developing unit/K does not rotate.)
- When the drum unit/K rotates for more than 450,000 times, abnormal noise will occur on the drum unit/K.
- When abnormal noise occurs, rotate the developing unit/K to resolve the abnormal noise.
- If abnormal noise occurs even when the drum unit/K rotates for less than 450,000 times, select "OFF/ON" to resolve the abnormal noise.

| SW No. |  |  |
| :--- | :--- | :--- |
| 29 |  | 30 |
|  | OFF | If the drum unit/K rotates for more than 450,000 times, rotate the developing unit/K at the time of start <br> or end of a process, reverse rotation of the transfer belt or cleaning of the 2nd transfer roller. (Default) |
| OFF | OFF | Prohibit rotation of the developing unit/K at the start or end of a process, reverse rotation of the <br> transfer belt or cleaning of the 2nd transfer roller. |
| ON | ON | Rotate the developing unit/K at the start or end of a process, reverse rotation of the transfer belt or <br> cleaning of the 2nd transfer roller. |
| OFF |  |  |

Procedure

1. Call the Service Mode to the screen.
2. Call the Enhanced Security to the screen.
3. Touch [Engine FW DipSW].
4. Touch [29] or [30], and check the key is highlighted (ON state) in reverse video.
5. Touch [END].
(x) Silent mode choice

- It switches the drive for the polygon motor, fusing, and fan during standby.

| SW No. |  |  |
| :--- | :--- | :--- |
| 37 |  | 38 |
|  |  |  |
| OFF | OFF | Normal mode (Default) |
| ON | OFF | Silent mode Level 1 (Advance polygon rotation is not energized) |
| OFF | ON | Silent mode Level 2 (Advance polygon rotation is not energized. Fusing and fan don't rotate during <br> standby) |

Procedure

1. Call the Service Mode to the screen.
2. Call the Enhanced Security to the screen.
3. Touch [Engine FW DipSW]
4. Touch [37] or [38], and check the key is highlighted (ON state) in reverse video.
5. Touch [END].
(y) Replacement timing Intelligent Control of Developing unit

- To set an optimal timing for part replacement depending on the usage of each user.

| OFF | Consumables/Parts Life Control |
| :--- | :--- |
| ON | Intelligent Life Control (Default) |

Procedure

1. Call the Service Mode to the screen.
2. Call the Enhanced Security to the screen.
3. Touch [Engine FW DipSW].
4. Touch [47] and check the key is changed (ON / OFF state).
5. Touch [END].

## (z) Replacement timing Intelligent Control of Transfer Roller Unit

- To set an optimal timing for part replacement depending on the usage of each user.

| OFF | Consumables/Parts Life Control |
| :--- | :--- |
| ON | Intelligent Life Control (Default) |

Procedure

1. Call the Service Mode to the screen.
2. Call the Enhanced Security to the screen.
3. Touch [Engine FW DipSW].
4. Touch [48] and check the key is changed (ON / OFF state).
5. Touch [END].

## (aa) Replacement timing Intelligent Control of Transfer Belt Unit

- To set an optimal timing for part replacement depending on the usage of each user.

| OFF | Consumables/Parts Life Control |
| :--- | :--- |
| ON | Intelligent Life Control (Default) |

Procedure

1. Call the Service Mode to the screen.
2. Call the Enhanced Security to the screen.
3. Touch [Engine FW DipSW].
4. Touch [49] and check the key is changed (ON / OFF state).
5. Touch [END].

## (ab) Replacement timing Intelligent Control of Drum unit

- To set an optimal timing for part replacement depending on the usage of each user.

| OFF | Consumables/Parts Life Control |
| :--- | :--- |
| ON | Intelligent Life Control (Default) |

## Procedure

1. Call the Service Mode to the screen.
2. Call the Enhanced Security to the screen.
3. Touch [Engine FW DipSW].
4. Touch [50] and check the key is changed (ON / OFF state).
5. Touch [END].

## (ac) CSRC Extension Data Notification function

- To set the range of data notified to CSRC.

| OFF | Notifies the normal data. (Default) |
| :--- | :--- |
| ON | Notifies the extension data. |

Procedure

1. Call the Service Mode to the screen.
2. Call the Enhanced Security to the screen.
3. Touch [Engine FW DipSW].
4. Touch [51] and check the key is changed (ON / OFF state).
5. Touch [END].

## (ad) Shut-down control of PPM for 15A breaker (when 15A plug is used on bizhub C658 for NA)

- To set whether to enable control for avoiding shut-down of the breaker.

| OFF | Disables PPM for breaker |
| :--- | :--- |
| ON | Enables PPM for breaker (default) <br> Make a trial calculation of the average current for one minute, and run it at half speed for one minute when the following <br> condition is met. <br> Condition: Continuing for three minutes at 16A or more, or continuing for five minutes at 15.2A or more |

## Procedure

1. Call the Service Mode to the screen.
2. Call the Enhanced Security to the screen.
3. Touch [Engine FW DipSW].
4. Touch [55] and check the key is changed (ON / OFF state).
5. Touch [END].

## (4) Notes when using the New Release Disable mode

(a) Before starting the mode

- Output the list in [Service Mode] -> [List Output] to check the information on the wear-out rate of each unit and keep the Dmax density adjustment value. Replace units that have reached their replacement time or that are near their replacement time with new ones, and perform New Release.
- If the toner is empty, start this mode when the toner empty status is resolved by replacing the toner cartridge with a new one or charging the toner.

## (b) During the New Release Disable mode

- The New Release Disable mode is subject to the condition that the New Release Disable mode should not be used for a long period, i.e. duration of printing only several tens of sheets. (Units used in the New Release Disable mode for a long time cannot be guaranteed as new ones.)
- In the New Release Disable mode, the drum unit/K life counter is not reset and it continues to count in a normal manner. If the counter reading becomes close to the value for the replacement time, the replacement time can be reached in the New Release Disable mode. (If the drum unit/K counter should reach the value for the replacement time while temporarily using a new drum unit/K in the New Release Disable mode, turn OFF the New Release Disable mode, open and close the front door (or turn the main power switch OFF and ON), and perform New Release in a normal manner. In this case, the previous drum unit/K, which has been temporarily removed, cannot be used again.)
- After activating the New Release Disable mode in [Engine FW DipSW], do not turn OFF and ON the main power switch or do not let the machine go into the sleep mode until the work in the New Release mode is completed.
(In case that the main power switch is turned OFF or the machine goes into the sleep mode, be sure to open the front door and turn the main power switch ON or activate the machine from the sleep mode. Then turn ON the New Release Disable mode and close the front door.)
(c) After finishing work in New Release Disable mode
- When continuing to use the new unit used in the New Release Disable mode in the same machine, turn OFF the new Release Disable mode and open and close the front door (or turn OFF and ON the main power switch) to perform New Release.
- To reinstall the previous unit used in the machine, open the front door, turn OFF the New Release Disable mode, replace the new unit with the previous unit, and close the front door (or turn the main power switch OFF and ON).
In this case, perform Initialize + Image Stabilization, Gradation Adjustment, and input of the previous Dmax density adjustment value in service mode. (If these adjustments are not performed, gradation reproducibility cannot be guaranteed.)
- After temporarily using a new drum unit/K in the New Release Disable mode, before reinstalling the previous drum unit/K, be sure to check the reading of the drum unit/K life counter in [Service Mode] -> [Counter] -> [Life] to learn that New Release is not performed on the new drum unit/K, i.e. the counter value has not decreased.
(There is no way to determine whether New Release is performed on the new drum unit/K or not from the appearance of the unit. Checking the counter reading is necessary to avoid bringing back the drum unit/K on which New Release is performed, assuming that the drum unit/K remains new.)

### 7.3.10 Engine Data Backup

## - Not used

### 7.3.11 HDD Data Backup

(1) Use

- To back up or restore the settings of the machine and the image data stored in the box

| Generic format Backup | - Store the setting data for this machine as an XML data and store the data saved in the box as <br> a TIFF-C image to the HDD connected with a USB. However, a data that is saved at 1200 dpi <br> in the box cannot be backed up. <br> - Since the free space in the HDD for backup cannot be checked beforehand, after starting the <br> backup, it will be terminated as an error at the time that no space remained in the HDD. |
| :--- | :--- | :--- |
| KM Format Backup | - Save the settings of the machine as a XML data, and save the image data in the box in <br> internal format (RAW data) to the HDD connected with a USB. <br> - A backup starts after making a confirmation of if the storage is enough. |

## (a) Target

- Settings an image data in the box to be backed up and restored are as follows.
- Setting data for MFP (User Settings, Administrator Settings, part of each settings in Service Mode)
- User authentication, Account track settings information
- One-touch Registration Address Information
- Images saved in the box (User box (Public, Personal, Group, and Encrypted PDF box)) *
- Information that configures boxes (setting data exclusive for boxes) *

NOTE

- *: Not applicable when no hard disk is mounted

## (b) Requirements

- Conditions required to backup/restore are as follows.
- To use a self-power external HDD (a type to supply power from outside) NOTE
- A bus-power external HDD shall not be used.
- After connecting an external HDD to the machine via a USB, the data is converted with ext3 format automatically.
- The backup will be executed after the backup data which has already existed in the external HDD is deleted automatically.
- Data of only one model can be saved in the external HDD.
- Cancellation during a backup is allowed. However cancellation during formatting an external HDD is not allowed.
- Operation of backup/restore is not allowed when a trouble or warning occurred.
- Operation of backup/restore is not allowed when a timer job has been reserved.

## (2) Setting item

- Generic format Backup
- KM Format Backup
- Restore
- Enter Password

(3) Procedure

## NOTE

- Set [Administrator Settings] -> [Security Settings] -> [Security Details] -> [Storage Data Backup] to [Allow].

If [Restrict] is set, the machine cannot be used.

- Be sure to turn the main power switch of the machine off and on after performing a backup/restore.

## (a) Backup

1. Connect the USB cable of an external HDD to the USB port of an MFP. (USB NG will be displayed when the HDD is not recognized correctly.)
2. Call the Service Mode to the screen
3. Call the Enhanced Security to the screen.
4. Touch [HDD Data Backup].
5. Select [Generic format Backup] or [KM Format Backup].
6. Touch [Enter Password], enter an encryption password using 1 to 32 characters, then touch [END].
7. Touch [Start]. ("Processing" will be displayed.)

Touch [Cancel] if you want to stop the backup.
8. After completing the backup, [Result OK] will be displayed.
9. Turn OFF and ON the main power switch.
(b) Restore

1. Connect the USB cable of an external HDD to the USB port of an MFP.
2. Call the Service Mode to the screen.
3. Call the Enhanced Security to the screen.
4. Touch [HDD Data Backup].
5. Select [Restore].
6. Touch [Enter Password], enter a decryption password using 1 to 32 characters, then touch [END].
7. Touch [Start]. ("Processing" will be displayed.)

Touch [Cancel] if you want to stop the restore.
8. After completing the restore, [Result OK] will be displayed.
9. Turn OFF and ON the main power switch.

### 7.3.12 Data Backup

(1) Use

## Client Function

- To be used for moving data at the time of MFP replacement.
- Back up data saved in an MFP to the WebDAV server or an HDD.

## Server Function

- Use MFP as backup server (WebDAV server).
(2) Server Backup - Backup Settings
(a) Function Setting
- Use
- To set whether to back up data to a server
- Default setting
- Disable
- Setting item
- ON
- Disable
- When $[O N]$ is selected, configure settings required for backup.

NOTE

- This function cannot be enabled when Transmission protocol, SMB Setting or HTTP Setting, Backup target and Encryption Password have not been set.
(b) Transmission protocol
- Use
- To select Transmission protocol.
- Default setting
- HTTP
- Setting item
- SMB
- HTTP
(c) SMB Setting
- Use
- To be set when "SMB" is selected for Transmission protocol.
- Enter the Host Name, File Path, User Name and Password.
(d) HTTP Setting
- Use
- To be set when "HTTP" is selected for Transmission protocol.
- Enter the URL, User Name, Password and Proxy.
(e) Backup target
- Use
- To select a target to back up.
- Setting item
- Remote Access Setting
- User Settings
- Service Settings
- Address Book*
- Authentication Data *
- Network Settings *
- Accessibility *
- Administrator Setting *
- Display Custom Settings *
- External Cert *
*: It is displayed only when [Enabled] is selected in [Service Mode] -> [System 2] -> [■] -> [ $\boldsymbol{\square}$ ] -> [Maintenance Mode], and [Allow] is selected in [Administrator Settings] -> [Security Settings] -> [Maintenance Mode Access].
(f) Encryption Password
- Use
- Enter the encryption password.
(3) Server Backup - Auto backup
(a) Use
- To set whether to execute auto backup.

NOTE

- It is displayed when Backup Settings is enabled.
(b) Default setting
- Unset
(c) Setting item
- Set
- Unset
- When "Set" is selected, configure settings for Backup Period (Interval of Day(s) or Weekly Frequency) and Day Frequency, or Weekly Frequency and Backup Time.

## (4) Server Backup - Immediate backup

(a) Use

- To be used for executing backup immediately.
- If "OK" appears when pressing "Start", the backup is completed successfully.
- If "NG" appears, an error code will be displayed. Contact the KM representative as necessary.
- S09401: The machine update password is mismatched.
- $\mathrm{N}^{* * * * * *: ~ E r r o r ~ r e l a t e d ~ t o ~ n e t w o r k . ~}$
- S99999: Error other than that related to network.

## (5) Server Backup - Backup result

(a) Use

- To make a confirmation of the date and time when the final backup is completed successfully.
- Up to 100 backup logs can be displayed in the order from the latest backup.
(6) Server Backup 2 - Format
- Use
- To select the format to back up.
- Setting Item
- Generic format
- KM Format

NOTE
Touch [Fix] after selecting the format.

## (7) Server Backup 2 - Backup Settings

(a) Function Setting

- Use
- To set whether to back up data to a server.
- To set whether to target box documents.
- Default setting
- Disable
- Setting item
- ON
- Disable
- When [ON] is selected, configure settings required for backup.

NOTE

- This function cannot be enabled when WebDAV Setting, Encryption Password and Data Hold Period have not been set.
(b) WebDAV Setting
- Use
- Enter the URL, User Name, Password and Proxy.
(c) Encryption Password
- Use
- Enter the encryption password.
(d) Data Hold Period
- Use
- To select data hold period.
- Default setting
- 60 days
- Setting item
- 1 day to 180 days
(8) Server Backup 2 - Auto backup
(a) Function Setting
- Use
- To set whether to execute auto backup.
- Default setting
- Disable
- Setting item
- ON
- Disable
- When [ON] is selected, configure settings required for backup.
(b) Full Backup

When "Full Backup" is selected, configure settings for Backup Period (Interval of Day(s) or Weekly Frequency) and Day Frequency, or Weekly Frequency and Backup Time.
(c) Diff. Backup

- When "Diff. Backup" is selected, configure settings for Backup Time.
(9) Server Backup 2 - Backup Reservation
- Use
- To select the backup reservation.
- Setting item
- Full Backup
- Difference Backup

NOTE
Touch [Fix] after selecting the backup reservation.
(10) Server Backup 2 - Backup History

- To make a confirmation of the date and time when the final backup is completed successfully.
- Up to 100 backup logs can be displayed in the order from the latest backup.
(11) Server Backup 2 - Immediate backup
- To be used for executing backup immediately.
- If "OK" appears when pressing "Start", the backup is completed successfully.
- If "NG" appears, an error code will be displayed. Contact the KM representative as necessary.
- S09401: The machine update password is mismatched.
- $\mathrm{N}^{* * * * * *: ~ E r r o r ~ r e l a t e d ~ t o ~ n e t w o r k . ~}$
- S99999: Error other than that related to network.
(12) Restore from Server - Restore Setting
(a) Use
- To specify a server for restore.
- Select a server and press "Start" to start restoring.
(13) Restore Settings - Server settings
(a) Use
- To specify a location from where restore data is to be downloaded.
(b) Default setting
- Acquire from Backup
(c) Setting item
- Acquire from Backup: Execute restore from the server specified in Backup Settings.
- Edit Restore path: Execute restore from a location other than the server specified in Backup Settings.
- When Edit Restore path is selected, enter Download Protocol and SMB setting, or HTTP Setting and Encryption Password.
(14) Restore from Server - Restore result
(a) Use
- To display the final date of restore.
(15) HDD Backup - Backup Settings
(a) Function Setting
- Use
- To set whether to execute backup to an HDD.
- Default setting
- Disable
- Setting item
- ON
- Disable
- When $[O N]$ is selected, configure settings required for backup.
(16) HDD Backup - Auto backup
(a) Use
- To set whether to execute auto backup.

NOTE

- It is displayed when Backup Settings is enabled.
(b) Default setting
- Unset
(c) Setting item
- Set
- Unset

When "Set" is selected, configure settings for Backup Period (Interval of Day(s) or Weekly Frequency), Day Frequency or Weekly Frequency, and Backup Time.
(17) HDD Backup - Immediate backup
(a) Use

- To be used for executing backup immediately.
- Press "Start" to reboot the MFP, and then start backup to the HDD.
(18) HDD Backup - Backup result
(a) Use
- To make a confirmation of the date and time when the final backup is completed successfully.
(19) Restore from HDD - Restore
(a) Use
- To execute restore from an HDD.
- Press "Start" to start restoring.
- Follow the message appearing on the screen and turn OFF and ON the main power switch.

## (20) Restore from HDD - Restore result

(a) Use

- To display the final date of restore.
(21) Backup Server Settings
(a) Function Setting
- Use
- To set whether to use the MFP as backup server (WebDAV server).
- Default setting
- Disable
- Setting item
- ON
- Disable
(b) Server Setting
- Use
- Enter the User Name and Password.

### 7.3.13 ADF Data Backup

(1) Use

- To back up or restore settings configured for ADF
- Used to save or restore settings when the DF control board is replaced.
- The backup data is stored in the eMMC board.
(2) Procedure
(a) ADF Data Save Mode (backup)

1. Touch [Service Mode] -> [Enhanced Security] -> [ADF Data Backup].
2. Select [ADF Data Save Mode], and touch [Start].
3. Check that the result "OK" appears.
(b) ADF Data Reflect Mode (restore)

## NOTE

- This function is available only when the data backed up in [ADF Data Save Mode] is stored in the eMMC board.

1. Touch [Service Mode] -> [Enhanced Security] -> [ADF Data Backup].
2. Select [ADF Data Reflect Mode], and touch [Start].
3. Check that the result "OK" appears.
4. Turn OFF the main power switch and turn it ON again more than 10 seconds after.

### 7.3.14 Customer Type

(1) Function Settings
(a) Use

- To set whether to configure setting of customer type.
(b) Default setting
- No
(c) Setting item
- Yes
- No
- When "Yes" is selected, configure setting of the business type and employee number.

### 7.3.15 TPM Setting

- It is displayed when the optional i-Option LK-115 is enabled.

## (1) Initialization

(a) Use

- To initialize the memory area installed on the TPM chip.

NOTE

- Be sure to perform it if the i-Option LK-115 is enabled.
(b) Procedure

1. Touch [Initialization].
2. Press the Start key.
(2) Status report
(a) Use

- To notify an error which is detected by the TPM chip self diagnosis, and output the diagnosis result, or output a report file to a USB memory.
- The TPM chip self diagnosis is conducted when the machine starts to run.
(b) Procedure (List Output)

1. Touch [Status report]
2. Touch [List Output].
3. Press the Start key.
4. The status report is output.
(c) Procedure (USB save)
5. Connect a USB memory to the USB port.
6. Touch [Status report]
7. Touch [USB save].
8. Press the Start key
9. The status report file is saved to the USB memory.

## 8. BILLING SETTING

- When using the optional upgrade kit UK-211 and license kit LK-102 v3, LK-104 v3, LK-105 v4, LK-106, LK-107, LK-108, LK-110 v2, LK-111, LK-114 or LK-115 v2, license management is done with [Service Mode] -> [Billing Setting] -> [License Management].
- [License Management] can set Activation/Deactivation of each i-Option functions, Repair/Initialize of functions for troubleshooting, or etc.

### 8.1 List of billing setting

| Billing Setting |  | Ref. page |
| :---: | :---: | :---: |
| Counter Setting |  | I.8.3.1 Counter Setting |
| Management Function Choice |  | I.8.3.2 Management Function Choice |
| Authentication Device 2 |  | I.8.3.7 Authentication Device 2 |
| Coverage Rate Clear |  | I.8.3.9 Coverage Rate Clear |
| License Management | Activation | I.8.3.10 License management - Activation |
|  | Deactivation | I.8.3.11 License management - Deactivation |
|  | Repair *1 | I.8.3.12 License management - Repair |
|  | Initialize | I.8.3.13 License management - Initialize |
|  | Request Code | I.8.3.14 License management - Request Code |
|  | List | I.8.3.15 License management - List |
|  | Function List | I.8.3.16 License management - Function List |
| Manage OpenAPI Authentication | Restriction Code | I.8.3.17 (1) Restriction Code |
|  | Region Code | I.8.3.17 (2) Region Code |
| WebDAV Server Setting |  | I.8.3.18 WebDAV Server Setting |
| Coverage Counter Setting |  | I.8.3.19 Coverage Counter Setting |
| Print Counter Clear |  | I.8.3.20 Print Counter Clear |
| Coverage Counter Detail |  | I.8.3.21 Coverage Counter Detail |

*1: It is displayed only when "License management error" occurs.

### 8.2 Starting/Exiting

### 8.2.1 Starting procedure

1. Call the Service Mode to the screen.
2. Press the following keys in this order

Stop -> 9
3. Select a mode.

### 8.2.2 Exiting procedure

1. Touch [Exit].
2. Turn OFF the main power switch. Wait 10 seconds, then turn $O N$ the main power switch again.

### 8.3 Billing Setting

### 8.3.1 Counter Setting

(1) Use

- To set the counting method for the total counter, size counter and banner paper counter.
- To set the size regarded as the large size (2 counts.)
- Use to change the counting method for the counters.
(2) Default setting (Total Counter Mode)
- Japan: Mode 1
- US, Europe, Others 1, Others 2, Others 3, Others 4, Others 5: Mode 2
(3) Setting item (Total Counter Mode)
- Mode 1: 1 count per copy cycle
- Mode 2: Large size is double counts

## NOTE

- The content of this setting is reflected in the count method with the key counter.
(4) Default setting (Large Size Counter Mode)
- US: A3 and $11 \times 17$
- Europe, Others 1, Others 2, Others 3, Others 4, Others 5: A3, B4, $11 \times 17$, and $81 / 2 \times 14$
- Japan: No Count
(5) Setting item (Large Size Counter Mode)

| A3/11 $\times 17$ | When it exceeds 279 mm in the main scan direction and 420 mm in the sub scan direction <br> (exceeds 399 mm at fax scan), it is regarded as the large size. |
| :--- | :--- |
| A3/B4/11 $\times 17 / 8 \frac{1}{2} \times 14$ | When it exceeds 215 mm in the main scan direction and 355 mm in the sub scan direction <br> (exceeds 337 mm at fax scan), it is regarded as the large size. |
| A3/11 $\times 17 / \mathrm{B} 4 / 8 \frac{1}{2} \times 14 /$ Foolscap | When it exceeds 203 mm in the main scan direction and 330 mm in the sub scan direction <br> (exeeds 313 mm at fax scan), it is regarded as the large size. (However the size in the main scan <br> direction changes according to the foolscap size setting.) |

- No Count
- $\mathrm{A} 3 / 11 \times 17$
- $\mathrm{A} 3 / \mathrm{B} 4 / 11 \times 17 / 8 \frac{1}{2} \times 14$
- $A 3 / 11 \times 17 / B 4 / 8 \frac{1}{2} \times 14 /$ Foolscap

## NOTE

- When the "Large Size Counter Mode" is set to "No Count", the machine operate with following conditions regardless of the each control panel settings.
- Total Counter: Mode1
- Banner Paper Counter Mode: Mode1
- Banner Counter Double Count Mode: OFF

## (6) Count-up table

| Print mode | 1-Sided |  |  |  | 2-Sided |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Size | Sizes other than those specified |  | Specified sizes |  | Sizes other than those specified |  | Specified sizes |  |
| Mode | Mode |  | Mode |  | Mode |  | Mode |  |
| Type | 1 | 2 | 1 | 2 | 1 | 2 | 1 | 2 |
| Total | 1 | 1 | 1 | 2 | 2 | 2 | 2 | 4 |
| Size | 0 | 0 | 1 | 1 | 0 | 0 | 2 | 2 |
| 2-sided Total | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 |

- 0: No count
- 1: 1 count
- 2: 2 counts
- 3: 3 counts
- 4: 4 counts

## (7) Default setting (Banner Paper Counter Mode)

- Mode 4
(8) Setting item (Banner Paper Counter Mode)
- When printing on the long paper ( 457.2 mm or over), the counting value will be the total of the value set by the total counter mode and the value by this setting.

| Mode 1 | 0 count |
| :--- | :--- |
| Mode 2 | 1 count |
| Mode 3 | +2 counts ( 457.2 to 915.0 mm will be +1 count) |
| Mode 4 | +3 counts ( 457.2 to 686.0 mm will be +1 count, and 686.1 to 915.0 mm will be +2 count) |

(9) Default setting (Banner Counter Double Count Mode)

- OFF
(10) Setting item (Banner Counter Double Count Mode)
- ON
- OFF

NOTE

- To set whether to use normal count or double count when printing long size paper.
" When "ON" is selected, double count is applied to only long size paper.
- The count method used when printing long size paper depends on the combination of the Counter Setting: Settings in Banner Paper Counter Mode and Banner Counter Double Count Mode. The following shows details on count methods that are the combination of each setting.

| Total Counter | Banner Paper Counter Mode | Banner Counter Double Count Mode | Paper size | Count |
| :---: | :---: | :---: | :---: | :---: |
| Mode 1 | Mode 1 | OFF | Normal size | 1 count |
|  |  |  | Long size | 1 count |
|  |  | ON | Normal size | 1 count |
|  |  |  | Long size | 2 counts |
|  | Mode 2 | OFF | Normal size | 1 count |
|  |  |  | Long size | 2 counts |
|  |  | ON | Normal size | 1 count |
|  |  |  | Long size | 4 counts |
|  | Mode 3 | OFF | Normal size | 1 count |
|  |  |  | Long size 457.3 to 915.0 mm | 2 counts |
|  |  |  | Long size 915.1 mm or more | 3 counts |
|  |  | ON | Normal size | 1 count |
|  |  |  | Long size 457.3 to 915.0 mm | 4 counts |
|  |  |  | Long size 915.1 mm or more | 6 counts |
|  | Mode 4 | OFF | Normal size | 1 count |
|  |  |  | Long size 457.3 to 686.0 mm | 2 counts |
|  |  |  | Long size 686.1 to 915.0 mm | 3 counts |

|  |  |  | Long size 915.1 mm or more | 4 counts |
| :---: | :---: | :---: | :---: | :---: |
|  |  | ON | Normal size | 1 count |
|  |  |  | Long size 457.3 to 686.0 mm | 4 counts |
|  |  |  | Long size 686.1 to 915.0 mm | 6 counts |
|  |  |  | Long size 915.1 mm or more | 8 counts |
| Mode 2 | Mode 1 | OFF | Small Size | 1 count |
|  |  |  | Specified sizes | 2 counts |
|  |  |  | Long size | 2 counts |
|  |  | ON | Small Size | 1 count |
|  |  |  | Specified sizes | 2 counts |
|  |  |  | Long size | 4 counts |
|  | Mode 2 | OFF | Small Size | 1 count |

|  | Mode 4 | OFF | Small Size | 1 count |
|  |  |  | Specified sizes | 2 counts |
|  |  |  | Long size 457.3 to 686.0 mm | 3 counts |
|  |  |  | Long size 686.1 to 915.0 mm | 4 counts |
|  |  |  | Long size 915.1 mm or more | 5 counts |
|  |  | ON | Small Size | 1 count |
|  |  |  | Specified sizes | 2 counts |
|  |  |  | Long size 457.3 to 686.0 mm | 6 counts |
|  |  |  | Long size 686.1 to 915.0 mm | 8 counts |
|  |  |  | Long size 915.1 mm or more | 10 counts |

## NOTE

" When the "Large Size Counter Mode" is set to "Not count", the machine operate with following conditions regardless of the each control panel settings.

- Total Counter: Mode1
- Banner Paper Count Mode: Mode1
- Banner Counter Double Count Mode: OFF

### 8.3.2 Management Function Choice

- To set whether or not the Key Counter, Management Device (Data controller), Authentication Device, or Vendor are to be mounted. NOTE
" This is not displayed when [Administrator Settings] -> [Security Settings] -> [Enhanced Security Mode] is set to "ON".
- When the setting shows that [Management Device 2] or [Vendor 2] is mounted, the following applications will be invalid. PC FAX transmission / HDD TWAIN/PS Box Operator / PS Scan Direct / PS Job Spooler / Fiery: Scan to Box Also, [Administrator Settings] -> [Security Settings] -> [Function Management Settings] -> [Network Function Usage Settings] will be set to "OFF".

### 8.3.3 Management Function Choice - Key Counter IF Vendor

\author{

- Not used
}

### 8.3.4 Management Function Choice - Key Counter Only

(1) Use

- To set whether or not the key counter is installed.
- Set when the key counter is mounted.
- Select [Color Mode] and [Message] when the key counter is mounted.
(2) Color Mode
- When [Mode 1] is set on [Total Counter Mode] after selecting [Billing Setting] -> [Counter setting].

| Mode 1 | 1 count per 1 print cycle |
| :--- | :--- |
| Mode 2 | 2 counts per 1 print cycle |
| Mode 3 | 3 counts per 1 print cycle |
| Mode 4 | 4 counts per 1 print cycle |
| Mode 5 | 5 counts per 1 print cycle |

- When [Mode 2] is set on [Total Counter Mode] after selecting [Billing Setting] -> [Counter setting] and large size is selected on [Large Size Counter Mode]

| Mode 1 | 2 counts per 1 print cycle |
| :--- | :--- |
| Mode 2 | 4 counts per 1 print cycle |
| Mode 3 | 6 counts per 1 print cycle |
| Mode 4 | 8 counts per 1 print cycle |
| Mode 5 | 10 counts per 1 print cycle |

- When [Mode 2] is set on [Total Counter Mode] after selecting [Billing Setting] -> [Counter setting] and sizes other than large size are selected on [Large Size Counter Mode] Mode 1

| Mode 1 | 1 count per 1 print cycle |
| :--- | :--- |
| Mode 2 | 2 counts per 1 print cycle |
| Mode 3 | 3 counts per 1 print cycle |
| Mode 4 | 4 counts per 1 print cycle |
| Mode 5 | 5 counts per 1 print cycle |

## (3) Message

(a) Procedure

- Select the message type when the administrative unit is mounted.

| Type 1 | Message for key counter |
| :--- | :--- |
| Type 2 | Message for card scanning |
| Type 3 | Message for ID management |
| Type 4 | Message for remote SW |

## (b) Setting item

- Type 1
- Type 2
- Type 3
- Type 4

## (4) Confirmation copy

(a) Procedure

- Set whether to allow a confirmation copy when a key counter is installed.
(b) Default setting
- Ban
(c) Setting item
- License
- Ban

## (5) The next job reservation

(a) Use

- Set whether to allow the reservation of the next job when a key counter is installed.
(b) Default setting
- Ban
(c) Setting item
- License
- Ban

NOTE

- The setting is available only when user authentication and account track are set "OFF" with [Administrator Settings] -> [User Authentication/Account Track] -> [General Settings].
(6) Count Setting
(a) Use
- To set the count timing used when the key counter is installed.
(b) Default setting
- Paper feed
(c) Setting item
- Paper feed
- Paper out

### 8.3.5 Management Function Choice - Management Device 2

(1) Use

- To set whether or not the management device 2 is installed.

| Mode 1 | Use contact type device. (Logout with ID key is not allowed) |
| :--- | :--- |
| Mode 2 | Use non-contact type device. (Logout with ID key is allowed.) |

(2) Setting item (Management Setting)

- Mode 1
- Mode 2

NOTE

- The setting is not available when either "External Server Authentication" of user authentication, "Password Only" of account track, "Do Not Synchronize" of user authentication and account track or "ON" of public user access has been set with [Administrator Settings] -> [User Authentication/Account Track] -> [General Settings].
(3) Billing Line
- To be displayed only when [Fax (Line 3)] and [Fax (Line 4)] are set to [Set] in [Service Mode] -> [System 2] -> [Option Board Status].
(a) Use
- To set which of Fax Line 1 or Fax Line 2 is used for billing Fax Line 3 and Fax Line 4.
(b) Default setting
- Line 3: Line1
- Line 4: Line2
(c) Setting item
- Line1
- Line2

### 8.3.6 Management Function Choice - Vendor 2

(1) Use

- To set whether or not the vendor 2 is installed.

NOTE

- When using the vendor along with the key counter, inserting the key counter will set it to the "Key Counter Mode" and removing it will set it to the "Vendor Mode".
(2) Procedure
- Select color mode and message of key counter. (Only for key counter, the type of the color mode and message are same after mounting.)
(3) Procedure (Confirmation copy)
(a) Use
- Set whether to allow a confirmation copy when a key counter is installed.
(b) Default setting
- Ban
(c) Setting item
- License
- Ban
(4) Procedure (The next job reservation)
(a) Use
- Set whether to allow the reservation of the next job when a key counter is installed.
(b) Default setting
- Ban
(c) Setting item
- License
- Ban

## (5) Procedure (Count Setting)

(a) Use

- To set the count timing used when the key counter is installed.
(b) Default setting
- Paper feed
(c) Setting item
- Paper feed
- Paper out

## (6) Procedure (Message)

(a) Use

- Select message of vendor.

| Type 1 | Message for key counter |
| :--- | :--- |
| Type 2 | Message for card scanning |
| Type 3 | Message for ID management |

(b) Setting item

- Type 1
- Type 2
- Type 3

## (7) Billing Line

- To be displayed only when [Fax (Line 3)] and [Fax (Line 4)] are set to [Set] in [Service Mode] -> [System 2] -> [Option Board Status].
(a) Use
- To set which of Fax Line 1 or Fax Line 2 is used for billing Fax Line 3 and Fax Line 4.
(b) Default setting
- Line 3: Line1
- Line 4: Line2
(c) Setting item
- Line1
- Line2

### 8.3.7 Authentication Device 2

(1) Use

- To set whether or not the authentication device 2 is installed.
- Set when the authentication unit (biometric type or card type) is mounted.

NOTE

- When using the authentication device including AU-102, AU-201 and AU-201S the loadable device driver needs to be installed.
Driver Instal
Utility tool

| Card | Uses IC card authentication system (AU-201/AU-201S/AU-201H/AU-202H/OMNIKEY 5427CK <br> $($ AU-205H)/YSoft card reader/USB keyboard emulation card reader). |
| :--- | :--- |
| Body | Uses biometrics (finger vein) authentication system (AU-102) |
| Card 3 | Uses IC card authentication device for PKI card system |

- When selecting [Body], set a film timeout interval, capture trial time and authentication trial time.
- When selecting [Card], a response timeout interval is displayed. (The interval is unchangeable.)
- [Card 3] will be displayed only when [Service Mode] -> [System 2] -> [Software Switch Setting] shows that switch No. 12 is set to [00000010]/[02] (bit value/HEX value).

## (2) Setting item

Authentication Mode

- Card
(3) Installation procedures of authentication unit
(a) AU-102

1. Install the AU-102 loadable driver (BIO_LDR.tar) to the main unit. *1
2. Install the AU-102 to the main unit.
3. Select [Body] in [Service Mode] -> [Billing Settings] -> [Authentication Device 2].
4. Turn off the main power switch and turn it on again more than 10 seconds after.
5. Register the authentication user data.

Note *1

- Use the loadable driver combined with the proper firmware version.

| Authentication units |  |
| :--- | :--- |
| AU-102 | Biometric |

(b) AU-201/AU-201S

1. Install the loadable driver (ICC_LDR.tar) to the main unit. *1,*2,*3
2. Install the AU-201/AU-201S to the main unit.
3. Select [Card] in [Service Mode] -> [Billing Settings] -> [Authentication Device 2].
4. Turn off the main power switch and turn it on again more than 10 seconds after.
5. Register the authentication card data.

Note *1

- A combination of the loadable driver and the IC card information setting file will be supplied as a loadable driver by KM.

Note *2

- The loadable driver to be installed varied according to the type of the card. Identify the type of the card requiring authentication and install the correct loadable driver.
- Use the loadable driver combined with the proper firmware version.

| Authentication units | Loadable driver name (KM <br> standard setting) | Compatible IC cards |
| :--- | :--- | :--- |
| AU-201 | AU-201 loadable driver (FeliCa <br> IDm) | FeliCa IDm, FeliCa SSFC, FeliCa FCF, FeliCa FCF(Campus), <br> TypeA |
|  | AU-201 loadable driver (FeliCa <br> Private) | FeliCaPrivate |
| AU-201S | AU-201S loadable driver | FeliCa IDm, FeliCa SSFC, FeliCa FCF, FeliCa FCF(Campus), <br> TypeA, FeliCaPrivate |

## Note *3

- If FeliCa IDm, FeliCa SSFC, FeliCa Private, or related card requiring detailed settings is to be used, make the detailed settings by using either one of the following methods:

1. Using the Auth Device Tool Advanced for AU-201/AU-201S, prepare a combination of the loadable driver and the IC card information setting file and export it as a loadable driver.
Utility tool
2. Using the Auth Device Tool Advanced for AU-201/AU-201S, prepare the IC card information setting file only and install the loadable driver in the MFP. Then, using the PageScope Data Administrator, write the IC card information setting file in the MFP.
Utility tool
E.g.: Information setting sample when the FeliCa SSFC card is used

| Information to be obtained from the administrator |  |  |
| :---: | :---: | :---: |
| Items of FeliCa SSFC detail setting | Sample-data (decimal number) | Setting value (hexadecimal number) |
| Room number | 37 | 0025 |
| Floor number | 15 | 000 F |
| Building number | 50 | 0032 |
| Area number | 85 | 0055 |
| Security level | 2 | 0002 |
| Company identification code (CL code) <br> $* 1$ | 06BGLQVX17 (ASCII code) | 303642474 C 5156583137 |
| Company code *2 | CompanyA (ASCII code) | CompanyA |

*1: The character length of the company code is 10 bytes.
*2: Use alphabetical upper case/lower case characters and numeric characters for Company code. When the company code is not set, this space will be left blank.
(c) USB keyboard emulation card readers *1

1. Install the loadable driver (ICC_LDR.tar) to the main unit. *2
2. Select [Card] in [Service Mode] -> [Billing Settings] -> [Authentication Device 2].
3. Turn off the main power switch and turn it on again more than 10 seconds after.
4. Set Vendor ID and Product ID of the card reader in [Administrator Settings] -> [User Authentication/Account Track] -> [Authentication Device Settings] -> [General Settings] -> [Card Authentication] -> [USB Device identification information]. *3
5. Turn OFF the main power switch.
6. Install the USB keyboard emulation card readers to the main unit.
7. Turn ON the main power switch.
8. Register the authentication card data.

## Note *1

- Use the card reader supporting US keyboards.
- The length of card ID is 1 to 512 bytes.
- Send data as card ID data received until the reception of the key code that has been set as a delimiter (Enter).

Note *2

- Use the loadable driver combined with the proper firmware version.

| Authentication units | Loadable driver name (KM <br> standard setting) | Compatible IC cards |
| :--- | :---: | :--- |
| USB keyboard emulation card <br> readers | KeyboardEmu loadable driver | Depends on the card reader * |

- *: The card type is reported to the authentication program as an extended card type.

Note *3

- Vendor ID and Product ID are identification information to specify USB devices.
- Check Vendor ID and Product ID of the USB device to be connected as follows:
- Refer to the specification of the device or ask the vendor.
- Connect the device to a Windows PC and check "Property" in "Device Manager."
(d) Miscellaneous card readers
- The same setting method as that for AU-201/AU-201S applies for other card readers.
- The following loadable drivers are necessary.
- Use the loadable driver combined with the proper firmware version.

| Authentication units | Loadable driver name (KM standard setting) | Compatible IC cards |
| :---: | :---: | :---: |
| AU-201H | AU-201H loadable driver | HID Prox*3 |
| AU-202H | AU-202H loadable driver *1 | HID iClass |
| OMNIKEY 5427CK (AU-205H) | 5427CK (AU-205H) loadable driver *1 | HID Prox, HID iCLASS, TypeA , FeliCa IDm *4 |
| KM USB Reader v2 MultiReader HF | Loadable driver for YSoft card reader (Default: HID Prox) *2 | Mifare |
| KM USB Reader v2 Legic Advant |  | LEGIC |
| KM USB Reader v2 ASK FSK 125kHz |  | EM4100, EM4102, RFID 125kHz |
| KM USB Reader v2 Mot/Ind W26 |  | Indala |
| KM USB Reader v2 HID Prox |  | HID Prox |
| KM USB Reader v2 HID iCLASS |  | HID iCLASS |

Note *1

- If cards of HID iClass of AU-202H or HID iClass of OMNIKEY 5427CK (AU-205H) that require detailed settings are to be used, make the detailed settings by using either one of the following methods:

1. Using the Auth Device Tool Advanced for AU-202H or Auth Device Tool Advanced for 5427CK (AU-205H), prepare a combination of the loadable driver and the IC card information setting file and export it as a loadable driver.
Utility tool
2. Using the Auth Device Tool Advanced for AU-202H or Auth Device Tool Advanced for 5427CK (AU-205H), prepare the IC card information setting file only and install the loadable driver in the MFP. Then, using the PageScope Data Administrator, write the IC card information setting file in the MFP.
Utility tool
Note *2

- If a YSoft card reader is used, all types of card will be reported as HID Prox card to the authentication program (Default).
- To report the card type other than HID Prox to the authentication program, choose the corresponding card type shown in the following list.

| Card Reader Name | Readable Card Type | Card type to be reported to the <br> authentication program (Default) <br> ${ }^{2} 2-5,{ }^{* 2-7}$ | IC Card Information Setting (card type to <br> be reported) *2-6 <br> Utility tool |
| :--- | :--- | :--- | :--- |
| KM USB Reader v2 <br> MultiReader HF | Mifare | HID Prox | TypeA (1) *2-1,*2-4 |
| KM USB Reader v2 Legic <br> Advant | LEGIC | HID Prox | TypeA (1) *2-1,*2-4 |
| KM USB Reader v2 ASK FSK <br> $125 k H z$ | EM4100, EM4102, RFID <br> $125 k H z$ | HID Prox | EM4100/ <br> EM4102/ <br> RFID 125kHz |
| KM USB Reader v2 Mot/Ind <br> W26 | Indala | HID Prox | Indala |
| KM USB Reader v2 HID Prox | HID Prox | HID Prox | HID Prox (1) *2-2,*2-4 |
| KM USB Reader v2 HID <br> iCLASS | HID iCLASS | HID Prox | HID iCLASS (1) *2-3,*2-4 |

- *2-1 The content (ID) to be read from the type A card setting differs from which to be read by using AU-201/AU-201S.
- *2-2 The content (ID) to be read from the HID Prox card setting differs from which to be read by using AU-201H.
- *2-3 The content (ID) to be read from the HID iCLASS card setting differs from which to be read by using AU-202H.
- *2-4 When add the YSoft card reader to the authentication network composed of the present AU-201, 201S, 201H and 202H, the ID may vary depending on the card reader. Therefore, it is required to set the card type to TypeA (1), HID Prox (1) or HID iCLASS (1) and register the card again.
- *2-5 For the content to be read from the HID Prox card, since the ID length is fixed to $\mathbf{1 6}$ bytes, the unused part will be bridged with 0xFF.
- *2-6 If a card type other than HID Prox is selected, the card ID type will be set to up to 512 bytes, the card ID length will be reported together with the card ID.
- *2-7 If the card type is set to HID Prox by using the LDAP-IC card authentication, specify the card ID type to be sent to the LDAP server as shown below.

1. Software switch No. 135 Hex: 00 Reports that the 1st byte shows the ID length of the card, the 2nd byte and after shows the card ID. (Default)
2. Software switch No. 135 Hex: 01 Reports the card ID with the ID length including the 1st byte.

Note *3

- If the card type is set to HID Prox by using the LDAP-IC card authentication, specify the card ID type to be sent to the LDAP server as shown below.

1. Software switch No. 135 Hex: 00 Reports that the 1st byte shows the ID length of the card, the 2nd byte and after shows the card ID. (Default)
2. Software switch No. 135 Hex: 01 Reports the card ID with the ID length including the 1st byte.

Note *4

- To use FeliCa, make either of the following settings.
- Select [FeliCa] at [Administrator Settings] -> [User Authentication/Account Track] -> [Authentication Device Settings] -> [General Settings] -> [Card Authentication] -> [IC Card type setting].
- Although [Use Card Reader Settings] is also selectable at [Administrator Settings] -> [User Authentication/Account Track] -> [Authentication Device Settings] -> [General Settings] -> [Card Authentication] -> [IC Card type setting], "FeliCa" is dedicated for the card reader (OMNIKEY5427CK) settings.
- Make card reader (OMNIKEY5427CK) settings with the tool that is exclusively used for PC settings and downloaded from the HID web page.

### 8.3.8 Setting items that automatically change the setting values

## NOTE

- Performing the setup for each unit to be mounted will internally change the setting values below. It needs resetting when cancelling the setting in order to set back to "UnSet" because the setting value will remain.
(1) When the vendor2 is mounted

| Setting Item |  | Vendor 2 |
| :---: | :---: | :---: |
| Utility | Default Copy Settings | Factory Default |
|  | Default Scan/Fax Settings | Factory Default |
|  | Copy Operating Screen | [Yes] |
|  | Fax Active Screen | Tx/Rx Display [Yes] |
|  | Scan/Fax Settings -> Default Tab | Direct Input |
|  | Custom Display Settings -> Left Panel Display Default | Change Left Panel Display Default to "Bookmark." |
| Administrator Settings | Usage Settings for Each Function | Copy, PC print, and Send Data will be set to "ON". Others Prints will be set to "OFF". |
|  | Administrator Security Levels | Prohibit |
|  | Restrict Access to Job Settings | Changing Job Priority, Delete Other User Jobs, and Changing Zoom Ratio will be set to "Restrict". |
|  | Job Priority Operation Settings | "Skip Job (Fax)" will be set to "Yes". "Skip Job (Copy, Print)" will be set to "Yes". Change "Fax RX Job priority" to "No." |
|  | External Memory Function Settings | External Memory Document Scan will be set to "OFF". |
|  | Forward TX Setting | No |
|  | Fax Settings -> Memory RX Setting | Password for Memory RX Setting is set to the default value of the administrator password |
|  | DPWS Settings -> Printer Settings/Scanner Settings | OFF |
|  | Image Log Transfer Settings | OFF |
| Service Mode | Software Switch Setting | SW No. 63 will be set to [00000000] at Bit assignment/[00] at HEX assignment. |
|  | FAX | [System] -> [Display Setting] -> [Re-Transmission] will be set to "OFF". |

(2) When the key counter IF vendor is mounted

| Setting Item |  | Key counter IF Vendor |
| :--- | :--- | :--- |
| Utility | Default Copy Settings | Factory Default |
|  | Default Scan/Fax Settings | Factory Default |
|  | Copy Operating Screen | [Yes] |
|  | Fax Active Screen | Tx/Rx Display [Yes] |
|  |  |  |

| Setting Item |  | Key counter IF Vendor |
| :---: | :---: | :---: |
|  | Scan/Fax Settings -> Default Tab | Direct Input |
|  | Custom Display Settings -> Left Panel Display Default | Change Left Panel Display Default to "Bookmark." |
| Administrator Settings | Usage Settings for Each Function | Copy, PC print will be set to "ON". Send Data, Others Prints will be set to "OFF". |
|  | Administrator Security Levels | Prohibit |
|  | Weekly Timer ON/OFF Settings | OFF |
|  | Restrict Access to Job Settings | Changing Job Priority, Delete Other User Jobs, Registering and Changing Addresses, and Changing Zoom Ratio will be set to "Restrict". |
|  | Job Priority Operation Settings | Change "Fax RX Job priority" to "No." |
|  | External Memory Function Settings | External Memory Document Scan will be set to "OFF". Save Document and Print Document will be set to "OFF". |
|  | Fax Settings -> Memory RX Setting | Password for Memory RX Setting is set to the default value of the administrator password |
|  | Forward TX Setting | No |
|  | OpenAPI Settings | Access Setting will be set to "Restrict" and Authentication will be changed to "OFF" setting. |
|  | Apply Stamps/Stamp | No |
|  | Apply Stamps/Copy Protect | No |
|  | Apply Stamps/Stamp Repeat | No |
|  | Apply Stamps/Registered Overlay | No |
|  | Apply Stamps/Header/Footer | No |
|  | Apply Stamps/Page Number/Text Color | Black |
|  | Apply Stamps/Date/Time/Text Color | Black |
|  | DPWS Settings -> Printer Settings/Scanner Settings | OFF |
|  | Image Log Transfer Settings | OFF |
| Service Mode | Software Switch Setting | SW No. 63 will be set to [00000000] at Bit assignment/[00] at HEX assignment. |
|  | FAX | [System] -> [Display Setting] -> [Re-Transmission] will be set to "OFF". |

(3) When the management device 2 is mounted

| Setting Item |  | Management Device 2 |
| :--- | :--- | :--- |
| Administrator Settings | Usage Settings for Each Function | Copy, PC print, Send Data, and Others Prints will be set to "ON". |
|  | Line Parameter Setting | Receive Mode will be changed to "Auto RX". |
|  | DPWS Settings->Printer Settings/ <br> Scanner Settings | OFF |

(4) When the authentication device 2 is mounted

| Setting Item |  | Authentication Device 2(Card/Body) |
| :--- | :--- | :--- |
| Administrator Settings | User Authentication/Account <br> Track -> General Settings -> User <br> Authentication | This setting will be set to "ON(MFP)" if External Server Authentication has <br> been set. |

### 8.3.9 Coverage Rate Clear

(1) Use

- To clear the coverage rate.

## (2) Procedure

- Touching [END] key will clear the coverage rate.
(3) Default setting
- Unset

## (4) Setting item

- Set
- Unset

### 8.3.10 License management - Activation

## (1) Functions

- To activate i-Option functions.
(2) Use
- To activate i-Option functions with CE.
- The functions can be activated by selecting the desired function and enter the appropriate license code and function code.
- Administrators also can carry out the procedure No. 14 or later step to activate i-Option functions through Administrator Settings.
(3) Procedure

NOTE

- You need to access License Management System (LMS) to implement each function setting.
- Before accessing the LMS, CE are required to register the E-mail address and the password in the LMS. To register, click [CE Initial Registration] that is located in the upper right of CE Login screen.

1. Prepare "token certification."
2. Access the following URL using the PC connected to the Internet.
https://Ims.konicaminolta.com/license/KM/support.aspx
3. Click [CE Login].

4. Enter [E-Mail Address] and [Password], and click [Login].

5. Click [Generate License Code].

6. Enter the serial number of the target MFP, and click [Next].

NOTE

- Make sure to enter alphabet letters of the serial number in all capital letters.

7. Click [Next].

8. Enter the token number written in the token certification, and select the product description
9. Click [Add].

10. Confirm the registered items, and click [Next].

11. Click [Generate License Code].

12. LMS issues license code and function code.
13. Write down the serial number, license code and function code.
<When activating with an USB memory>
Click [Download], and save a "***.fek" file to the root directory of the USB memory.

14. Select [Service Mode] -> [Billing Setting] -> [License Management].

15. Select [Activation] -> [Function Code] or [License Code], and enter the function code and the license code confirmed at Step13. <When activating with an USB memory>
Connect the USB memory to the USB port on the side of the control panel, and select [Activation] -> [USB].
16. Touch [Apply].

17. Follow the massage appearing on the screen and turn OFF and ON the main power switch. <When activating with an USB memory>
This step is unnecessary. Proceed to the next step.
18. Select [Service Mode] -> [Billing Setting] -> [License Management] -> [Function List], and confirm that the activated function is displayed at the list.

### 8.3.11 License management - Deactivation

## (1) Functions

- To deactivate i-Option functions.
(2) Use
- To deactivate i-Option functions due to registration error, expiration of lease term, change to other MFP or etc.
- The functions can be deactivated by selecting the desired function and enter the appropriate deactivation code.

## (3) Procedure

NOTE

- You need to access License Management System (LMS) to implement each function setting.
- Before accessing the LMS, CE are required to register the E-mail address and the password in the LMS. To register, click [CE Initial Registration] that is located in the upper right of CE Login screen.

1. Check the serial number of the target MFP.
2. Access the following URL using the PC connected to the Internet. https://Ims.konicaminolta.com/license/KM/support.aspx
3. Click [CE Login].

4. Enter [E-Mail Address] and [Password], and click [Login].

5. Click [Deactivate License Code].

6. Enter the serial number of the target MFP, and click [Retrieve].

NOTE

- Make sure to enter alphabet letters of the serial number in all capital letters.

[^41]
8. LMS issues deactivation code and function code.
9. Write down the serial number, deactivation code and function code.
<When deactivating with an USB memory>
Click [Download], and save a "***.fek" file to the root directory of the USB memory.

10. Select [Service Mode] -> [Billing Setting] -> [License Management].

11. Select [Deactivation] -> [Function Code] or [Deactivation Code], and enter the function code and the deactivation code confirmed at Step9.
<When deactivating with an USB memory>
Connect the USB memory to the USB port on the side of the control panel, and select [Deactivation] -> [USB].
12. Touch [Apply].

13. Write down or print out the serial number and deactivation complete code.
<When deactivating with an USB memory>
MFP will restart automatically. After MFP restarts, write down or print out the serial number and deactivation complete code.
NOTE

- When A4S or $81 / 2 \times 11 S$ is set to the paper feed tray, the above-mentioned serial number and deactivation complete code can be printed out by pressing the start key.
- Serial number and deactivation complete code can be confirmed in [List] available from [License Management].

| Billing setting | /License Management |  |
| :---: | :---: | :---: |
|  | Serial Number <br> Deactivation <br> Complete Code | 1234567800123 <br> $23456-23456-23458-23456-23456-23456-23456$ |

14. Follow the massage appearing on the screen and turn OFF and ON the main power switch. <When deactivating with an USB memory>
This step is unnecessary. Proceed to the next step.
15. Access to the LMS and login again.

For detail of the login method, refer to step 2 to step 4.
16. Click [Deactivate License Code in LMS].
17. Enter the serial number and the deactivation complete code confirmed at step13.

## NOTE

- Make sure to enter alphabet letters of the serial number in all capital letters.

18. "Deactivation Complete" message will be displayed

The license become invalid at both MFP and LMS, and deactivated token number can be used for another MFP.

### 8.3.12 License management - Repair

(1) Functions

- To repair license management information.
(2) Use
- To be used when license management information is lost due to replacement of MFP board or the eMMC board, or some other trouble.
- License management information can be repaired by acquiring repair code with repair request code, and entering the repair code.
(3) Procedure

NOTE

- You need to access License Management System (LMS) to implement each function setting.
- Before accessing the LMS, CE are required to register the E-mail address and the password in the LMS. To register, click [CE Initial Registration] that is located in the upper right of CE Login screen.
" When the message "License management error occurred." is displayed, carry out the repair operation with the following steps.

1. Select [Service Mode] -> [Billing Setting] -> [License Management].

2. Select [Repair] -> [Repair Request Code].

3. Write down or print out the serial number, repair request code and request code.

## NOTE

- When A4S or $81 / 2 \times 11$ is set to the paper feed tray, the above-mentioned serial number and repair request code can be printed out by pressing the start key.

4. Access the following URL using the PC connected to the Internet.

- https://Ims.konicaminolta.com/license/KM/support.aspx

5. Click [CE Login].

6. Enter [E-Mail Address] and [Password], and click [Login].

7. Click [Repair License Code].
8. Enter the serial number, repair request code and request code confirmed at step3, and click [Registration]. NOTE

- Make sure to enter alphabet letters of the serial number in all capital letters.

9. LMS issues repair permission code.
10. Write down the serial number and repair permission code.

11. Select [Service Mode] -> [Billing Setting] -> [License Management].

12. Select [Repair] -> [Repair Code], and enter the repair code confirmed at step10.

13. Touch [Apply].

14. After repair is completed, the machine restarts automatically.

### 8.3.13 License management - Initialize

(1) Functions

- To initialize license management information.
(2) Use
- To be used when license management information cannot be repaired.
- License management information should be initialized when the machine fails to generate request code or repair request code due to any trouble and the information cannot be repaired.

## (3) Procedure

NOTE

- You need to access License Management System (LMS) to implement each function setting.
- When license management information cannot be repaired, initialize the information with the following procedure.

1. Contact the license management section of sales company to report the information necessary to issue the initialize code.
2. The license management section of sales company supplies the initialize code.
3. Call the Billing Setting to the screen.
4. Touch [License Management] -> [Initialize].
5. Enter the initialize code issued by call center using the keyboard on the screen, and touch [Apply].

6. After completing the initialization, follow the message appearing on the screen and turn OFF and ON the main power switch.

### 8.3.14 License management - Request Code

- When the license management error is occurred, it will not be displayed until the repair code is input.
(1) Functions
- To display and print request code and serial number.
(2) Use
- To check the request code and serial number.
(3) Procedure
- Set A4S or $81 / 2 \times 11$ paper to the tray, and press start key at request code screen to print.

### 8.3.15 License management - List

(1) Functions

- To display and print deactivation complete code and serial number.
(2) Use
- To display and print deactivation complete code and serial number.
(3) Procedure
- Set A4S or $81 / 2 \times 11$ S paper to the tray, and press start key at deactivation complete code screen to print.

### 8.3.16 License management - Function List

(1) Functions

- To display currently activated functions.
(2) Use
- To display activated functions.

### 8.3.17 Manage OpenAPI Authentication

## (1) Restriction Code

(a) Use

- These are communication settings for the application which is developed by the third vendor. Do not set or change these settings without vendor's instructions.

## (2) Region Code

(a) Use

- These are communication settings for the application which is developed by the third vendor. Do not set or change these settings without vendor's instructions.

### 8.3.18 WebDAV Server Setting

(1) Select Address
(a) Use

- To select the address of the LMS server used to manage the license of i-Option.
- Used to change the LMS server address set at the time of shipment.

| Fixed Address | Uses the LMS server address set at the time of shipment. The specified address cannot be <br> changed. |
| :--- | :--- |
| Specify Address | Specifies a desired LMS server address. When selecting [Specify Address], [Server Setting] is <br> displayed. |

(b) Default setting

- Fixed Address
(c) Setting item
- Fixed Address
- Specify Address

## (2) Server Setting

(a) Use

- To configure the settings on the WebDAV server that communicates with MFP when selecting [Specify Address] in [Select Address].
(b) Procedure

| Host Name | Set the host name of the WebDAV server. (Up to 253 one-byte alphameric characters and <br> symbols) |
| :--- | :--- |
| File Path | Set the file path used in the WebDAV server communication. (Up to 47 one-byte alphameric <br> characters and symbols) |
| User name | Set the user name used to access the WebDAV server. (Up to 64 one-byte alphameric <br> characters and symbols) |
| Password | Set the password that is used to access the WebDAV server. (Up to 64 one-byte alphameric <br> characters and symbols) |
| Port Number | Set the port number that is used to access the WebDAV server. (Default: 80) |

(3) Polling
(a) Use

- To set the number of times and interval at which MFP polls the WebDAV server.
(b) Procedure

| Polling Count | Set the number of times that MFP polls the WebDAV server. (Default: 30 times.) |
| :--- | :--- |
| Polling Interval | Set the interval at which MFP polls the WebDAV server. (Default: 20 seconds.) |

## NOTE

- When MFP accesses to WebDAV server via proxy server, set the proxy setting in [Administrator Settings] -> [Network Settings] -> [WebDAV Settings] -> [Proxy Setting for Remote Access].

### 8.3.19 Coverage Counter Setting

- It will be displayed when [Service Mode] -> [System 2] -> [Software Switch Setting] shows that switch No. 206 is set to [00000001] at Bit assignment/[01] at HEX assignment.
(1) Use
- To set the counting method according to the print paper size, the total coverage rate of each color, and the count-up coefficient. NOTE
- The coverage rate refers to a ratio of the print area of each color relative to the print paper size.
- The coverage rate and the coefficient can be set for each of the print modes and paper sizes listed in the following table.

| Print mode | Paper size | Description |
| :--- | :--- | :--- |
| Color/Black | Small Size | Set the counting method for data printed on paper having a size smaller than A4/Letter. |
|  | A4 | Set the counting method for data printed on paper having a size of A4/Letter. |
|  | Large Size | Set the counting method for data printed on paper having a size larger than A4/Letter and equal to <br> or smaller than A3. |
|  | Banner | Set the counting method for data printed on paper having a size larger than A3. |

(2) Display YMC

- Set whether to use the total coverage rates of YMC, but K (black), in color printing as a basis for calculating the coverage counter.
- "Set" is the default setting.
- When "Set" is set, counting is performed regardless of the coverage rate of K as long as the coverage rate of YMC falls within the YMC total coverage rate.

- If "Unset" is set, the area to be counted is determined based on the total coverage rate of YMCK.

(3) Setting item (Coverage Rate Settings)
- Make settings relating to the YMC/YMCK total coverage rate.

| Setting item | Description |
| :--- | :--- |
| Number of Range Settings | Set the number of ranges used for setting the YMC/YMCK total coverage rate. <br> Default number of ranges: 4 <br> Setting range: 1 to 4 |
| YMC/YMCK Total Coverage Rate <br> Setting | Set the threshold values of each of the sets of the total coverage rate. <br> Default value: "Set 4" - 15.00 or more <br> "Set 3" - 9.00 to 14.99 <br> "Set 2" - 3.00 to 8.99 <br> "Set 1" - 0.00 to 2.99 <br> Setting range: 0.02 to 250.00 <br> The setting values should satisfy the following relation: <br> $0.02 \leqq$ setting values of set $2<$ setting values of set $3<$ setting values of set $4 \leqq 250.00$ |

(4) Procedure (Coverage Rate Settings)

1. Touch the [Coverage Counter Setting].
2. Select the [Color] or [Black].
3. When [Color] is selected, select [Set] or [Unset] for YMC display.
4. Select the paper size.
5. Touch the [Coverage Rate Settings].
6. Enter [Number of Range] from the 10-key pad.
7. When [Number of Range] is entered, the corresponding number of sets are displayed.
8. Select a [Set] and enter the threshold values of the coverage to be set from the 10-key pad.
9. After the values are entered, touch [END].
(5) Setting item (Coverage Rate Coeff. Settings)

- Set the coverage rate coefficient relative to the set made in Coverage Rate Settings.

| Setting item | Description |
| :--- | :--- |
| Coverage Rate Coeff. <br> Settings | Set the coefficient relative to the set total coverage rate set. <br> Default value: 1.00 <br> Setting range: 0.01 to 4.00 |

(6) Procedure (Coverage Rate Coeff. Settings)

1. Select the paper size.
2. Touch the [Coverage Rate Coeff. Settings].
3. Touch the [Set] set by [Coverage Rate Settings] and enter the coefficient from the 10-key pad.
4. After the coefficient has been entered, touch [END].

### 8.3.20 Print Counter Clear

- It will be displayed when [Service Mode] -> [System 2] -> [Software Switch Setting] shows that switch No. 206 is set to [00000001] at Bit assignment/[01] at HEX assignment.
(1) Use
- To clear Print Counter and Subtotal values of Coverage Counter Detail.
- Clear Subtotal value in [Meter Count] -> [Coverage Counter].

## (2) Procedure

- Select [Set] and touch [END].
(3) Default setting
- Unset
(4) Setting item
- Set
- Unset

### 8.3.21 Coverage Counter Detail

- It will be displayed when [Service Mode] -> [System 2] -> [Software Switch Setting] shows that switch No. 206 is set to [000000001] at Bit assignment/[01] at HEX assignment.
(1) Use
- To display details of the coverage counter value calculated according to Coverage Counter Setting.

| Indication | Description |
| :--- | :--- |
| Color/Black | Displays the count values of color and monochrome printing. |
| Total Coverage Counter | Displays the count values of color, monochrome, and total. <br> Displays the cumulative value of the coverage counter since the installation of the machine. |
| YMC/YMCK Total Coverage Rate (\%)*1 | Displays the set of the total coverage rate that serves as a basis for counting. |
| Coverage Rate Coefficient *1 | Displays the coverage rate coefficient set for each set that serves as the basis for countering. |
| Print Counter | Displays the count value of the number of printed pages on which the print paper size and the total <br> coverage rates of each color satisfy the counting base. |
| Subtotal | Displays the counter value obtained through the following calculation involving the print counter and <br> the coverage rate coefficient: <br> Subtotal = print counter $\times$ coverage rate coefficient |

- *1: What is displayed complies with the setting made in [Service Mode] -> [Billing Setting] -> [Coverage Counter Setting].

## NOTE

- The total coverage counter has been activated upon the installation of the machine regardless of whether it is displayed on the screen. Thus, the counter default value during screen display setting is not necessarily " 0 ".
- The total coverage counter value is the cumulative value since the installation of the machine, while the print counter value is the cumulative value since the last performance of print counter clear. Thus, the sum of the subtotal values does not necessarily coincide with the total coverage counter value.

## 9. DEBUG SETTINGS

- To configure the settings on log information acquisition performed to analyze the MFP controller's internal operation.

### 9.1 List of debug settings

| Debug Settings |  |  |
| :--- | :--- | :--- |
| Debug Log Output | Ref. page |  |
| Acquiring Mode | I.9.3.1 Debug Log Output |  |
| TX Debug Log Settings | I.9.3.2 Acquiring Mode |  |
| Remote Log Retrieval | Remote Log Retrieval | I.9.3.3 TX Debug Log Settings |
|  | Time Setting | I.9.3.4 (1) Remote Log Retrieval |
|  | polling | I.9.3.4 (2) Time Setting |
|  | Retrieve Log Information | I.9.3.4 (3) Polling |
| Remote Log Server Settings |  | I.9.3.5 Remote Log Server Settings |
| Enable Core Dump | I.9.3.6 Enable Core Dump |  |
| USB Password | I.9.3.7 USB Password |  |
| Other | I.9.3.8 Other |  |

### 9.2 Starting/Exiting

### 9.2.1 Starting procedure

## NOTE

- Before the procedure, set the switch No. 155 to [00000001] at Bit assignment/[01] at HEX assignment in [Service Mode] -> [System 2] -> [Software Switch Setting].

1. Call the Service Mode to the screen.
2. Press the following keys in this order.

- Stop -> 6 -> 1 -> 8

3. Select a mode.

### 9.2.2 Exiting procedure

1. Touch [Exit] on the Service Mode screen.
2. Turn OFF the main power switch. Wait 10 seconds, then turn $O N$ the main power switch again.

### 9.3 Debug Settings

### 9.3.1 Debug Log Output

(1) Use

- To select debug log data to be output and save it in a USB memory.

| All | Outputs available all logs. |
| :--- | :--- |
| Select File | Specifies a desired file and outputs it. Capable of narrowing file types from [Normal], [Trouble], or <br> [Print Data]. |
| Select Time | Specifies a desired period and outputs corresponding data. |
| Shared Memory -> HDD | - Manually stores debug information written in the memory into the HDD. |
| HDD -> USB Memory | - Outputs debug information stored in the HDD into a USB flash drive. <br> - After selecting [Output], saving is started by pressing the Start key. |

Logs obtained under normal operation and logs obtained upon occurrence of trouble are separated and stored in different areas. Up to 20 logs can be stored.

- Logs obtained under normal operation: 10 logs
- Logs obtained upon occurrence of trouble: 10 logs

When the number of saved logs reaches the upper limit, files are overwritten starting from the oldest file.

## (2) Setting item

- All
- Select File
- Select Time
- Shared Memory -> HDD
- HDD -> USB Memory

## NOTE

- If a USB memory is not connected to the USB port of MFP or [Administrator Settings] -> [Security Settings] -> [Security Details] -> [Export Debug Log] is set to [Restrict], output is unavailable.

### 9.3.2 Acquiring Mode

(1) Use

- To select mode used to acquire debug logs.
- If the cause of a problem cannot be identified by the debug logs acquired in basic mode, obtain more detailed debug logs in Enhance mode and analyze them.

| Basic | Normal mode Stores debug information saved in the memory into the HDD. |
| :--- | :--- |
| Enhance | Mode that enables you to obtain more detailed debug information than Basic mode. <br> When a large amount of detailed information must be output, the CPU or other devices is heavily <br> loaded and the performance of MFP is affected. |

(2) Default setting

- Basic

## (3) Setting item

- Basic
- Enhance
(4) Enhance mode
- When "Enhance" is selected, configure the following items.
(a) Network Packet
- If network packet information is necessary, select "ON."

## (b) Acquisition function

- Select the functions to be covered when obtaining debug logs.

Select All, Copy, Printer, Box, Net/Scan, PSWC, FAX, Net Fax, and Authentication

- This item will not be displayed when [Network Packet] is set to "ON."
(c) Network Packet
- If [Network Packet] is set to "ON," configure [Capture Filter Settings] and [Capture Settings].
- This item will not be displayed when [Network Packet] is set to "OFF."
(d) By Job
- Set the number of jobs handled as a unit (the number of jobs by which debug information is acquired).
(e) Individual Command
- Register and execute individual debug commands.
(f) Command Set
- Install a command set and execute it.
(5) Timing of Saving Debug Information in Each Mode
(a) Basic mode

Debug information is stored in the HDD at the timings described below.

- When trouble occurs
- When there is no job
- During transition to energy save mode (sleep mode or low power mode)
- When authentication fails
- When [Debug Log Output] -> [Shared Memory -> HDD] is performed manually
(b) Enhance mode
- Save debug information to the USB memory or HDD as needed.

### 9.3.3 TX Debug Log Settings

- To configure settings used to send debug information via the network.
- To send the information via the network, SMB, FTP, or WebDAV transmission is selectable.
- This item will be displayed only when [Acquiring Mode] is set to "Basic."

## (1) Select TX Method

(a) Use

- To select a method used to send via the network.
(b) Default setting
- OFF
(c) Setting item
- OFF
- SMB
- FTP
- WebDAV
(2) SMB Setting
(a) Use
- To configure settings used in SMB transmission.
(b) Procedure

| Host Name | Set the host name for the SMB server. |
| :--- | :--- |
| File Path | Set the file path used for SMB server communication. |
| User Name | Set the user name used to access the SMB server. |
| Password | Set the password used to access the SMB server. |

## (3) FTP Settings

(a) Use

- To configure settings used in FTP transmission.
(b) Procedure

| Host Name | Set the host name of the FTP server. |
| :--- | :--- |
| File Path | Set the file path used in the FTP server communication. |
| User Name | Set the user name used to access the FTP server. |
| Password | Set the password used to access the FTP server. |
| Port Number | Set the port number that is used to access the FTP server. |
| PASV | Set PASV mode to ON or OFF |
| Proxy | Set whether or not to connect to a proxy server. |

## (4) WebDAV Setting

(a) Use

- To configure settings used in WebDAV transmission.
(b) Procedure

| Host Name | Set the host name of the WebDAV server. |
| :--- | :--- |
| File Path | Set the file path used in the WebDAV server communication. |
| User Name | Set the user name used to access the WebDAV server. |
| Password | Set the password that is used to access the WebDAV server. |
| Port Number | Set the port number that is used to access the WebDAV server. |
| Proxy | Set whether or not to connect to a proxy server. |
| SSL Settings | Select to use SSL communication. |

### 9.3.4 Remote Log Retrieval

## (1) Remote Log Retrieval

(a) Use

- Use the WebDAV server to retrieve remote access logs.
- Downloads the command set from the server configured from [Remote Log Server Settings] -> [Command Set Acquisition pt.] at the timing configured from [Time Setting] and [Polling].
- If the command set successfully downloads, logs and settings data is retrieved in accordance with the command set, and the log files and settings data files are saved on the server configured from [Remote Log Server Settings] -> [Log Save Destination].
(b) Default Setting
- ON
(c) Setting item
- ON
- OFF

## (2) Time Setting

(a) Use

- Downloads the command set at the specified time and retrieves/saves the logs and settings data.
(b) Default Setting
- ON
(c) Setting item
- ON
- OFF
(3) Polling
(a) Use
- Downloads the command set at each specified time and retrieves/saves the logs and settings data.
(b) Default Setting
- ON
(c) Setting item
- ON
- OFF
(4) Retrieve Log Information
(a) Use
- Immediately downloads the command set and retrieves/saves the logs and settings data.

### 9.3.5 Remote Log Server Settings

(1) Command Set Acquisition pt.
(a) Use

- Configures the server from which command sets as used for [Remote Log Retrieval] are retrieved
- Touch [Copy Setting] after settings parameters are selected to copy the settings to the destination as configured from [Log Save Destination]

## (2) Log Save Destination

(a) Use

- Configures the server for storing files used for [Remote Log Retrieval].
- Touch [Copy Setting] after settings parameters are selected to copy the settings to the destination as configured from [Command Set Acquisition pt.].

### 9.3.6 Enable Core Dump

(1) Use

- To set whether to acquire a log of Core Dump
(2) Default setting
- Disable
(3) Setting item
- Enable (Select [USB Memory] or [Remote Log Server].)
- Disable

NOTE

- When [Enable] is selected, select a saving location and press [Fix]
- When [Remote Log Server] is selected, be sure to complete setting of [Log Save Destination] in [Remote Log Server Settings].

### 9.3.7 USB Password

(1) Use

- To set a password used to store debug information into a USB flash drive.
- CE informs the KM contact person of this password and the debug information data separately.

NOTE

- NEVER forget the USB password.
(2) Default setting
- 01234567890123456789
(3) Procedure
- Enter an USB password from the keyboard on the screen.

1. Current Password: Enter the USB password currently in use
2. New Password: Enter a new USB password.
3. Re-input Password: Re-enter the new USB password.

### 9.3.8 Other

(1) Screen Capture

- The screen displayed on the control panel can be captured and saved in a USB memory as a file.

## (a) Preparations

## NOTE

- Use a USB memory having no security functions

1. Touch [Other].
2. Touch [Screen Capture] and then [END].

3. Insert the USB memory.

## (b) Procedure

1. Call the screen to be captured to the control panel.
2. Touch [1] on the control panel. This saves the screen in memory.

A "Capture" folder is automatically created and a file in the PNG format is saved in the folder.

| $[1]$ | $[1]$ key | $[2]$ |
| :--- | :--- | :--- |
| In USB memory |  |  |

(c) Continuous capturing procedure

1. Call the screen to be captured to the control panel.
2. Touch [2] on the control panel.
3. Start the screen operations.
4. When the operations are completed, touch [10 keypad].
5. A "Capture" folder is automatically created and a file in the PNG format is saved in the folder.

| $[1]$ | [2] key | [2] $\quad$ [10 keypad] key |
| :--- | :--- | :--- |

| $[3] \quad$ In USB memory | - | - |
| :--- | :--- | :--- |

## (2) Panel Operation Playback

A series of operations is stored in memory and automatically played back on the control panel.
NOTE

- To perform the playback, be sure to go back to the first screen with which the capturing was started. A playback operation starting with any screen not stored in memory results in faulty playback.
(a) Preparations

Touch [Other].
2. Touch [Panel Operation Playback] and then [OK].

(b) Procedure

1. Call the auto playback starting screen to the control panel.
2. Touch [1].
3. Start the screen operations to store a series of screens.
4. When the operations are completed, touch [2].
5. Go back to the first screen and touch [10 keypad].

### 9.4 Operation of the debug log function

### 9.4.1 Basic mode

(1) Intended purpose

- To retrieve the program sequence logs from the MFP; for analyzing field problems caused by MFP controller program malfunction which could be difficult to reproduce in KM.
NOTE
- CE should get permission from CUSTOMER before retrieving the program sequence logs from the customer's MFP.
- A Key generate utility is required for creation of a key file.
- For how to obtain or how to use the Key generate utility, please conduct the KM support department.
(2) Outline

1. Save the key file in the USB memory by using the Key generate utility on the PC.
2. Set the Debug Settings to "ON" in the Service Mode.
3. Sets an encryption word.
4. Try to reproduce the problem/malfunction on the MFP.
5. The problem/malfunction is reproduced.
6. Set the debug log acquisition to "Allow" in Administrator Settings.
7. Select the debug $\log (\mathrm{s})$ that corresponds to the problem. Select "USB Memory" as the output destination and acquire the log(s).
8. Send the $\log (\mathrm{s})$ and the USB password to the department of KM from which you receive instructions.

## NOTE

- Up to a total of 20 log files can be saved, including ten during normal operations and another ten when errors occur.
- When the number of log files saved exceeds the upper limit, the log files are overwritten in chronological order.
- Each log file is concerned with a single job.
- Priority is given to job processing. A log file may not therefore be saved if jobs are performed continuously or if power is turned OFF immediately after processing of a job has been completed.
(3) Details of the procedure
(a) Advance preparation
- Save a key file into a USB memory.

1. Set the USB Password on the Key generation utility.
2. Generate the Key file by typing in the Serial number (capital letter) of the target MFP.
3. Copy the created "Debug Log" folder into the root directory of the USB memory.

- Make sure that [Administrator Settings] -> [Security Settings] -> [Enhanced Security Mode] is set to OFF.
(b) Settings for acquiring logs

1. Get permission from the CUSTOMER to retrieve the program sequence logs from the MFP at the customer's site. NOTE

- Logs include the MFP control program sequences only. They do not include the copy/scan/print/fax image data.

2. Set the switch No. 155 to [00000001] at Bit assignment/[01] at HEX assignment in [Service Mode] -> [System 2] -> [Software Switch Setting].
3. Call the Debug Settings to the screen.
4. Select [Basic] in [Debug Settings] -> [Acquiring Mode].
5. Ask the administrator of the MFP to set a debug log encryption pass phrase in [Administrator Settings] -> [Security Settings] -> [HDD Settings] -> [Debug Log Encryption Settings]. (Default: 01234567890123456789)
NOTE

- This setting is used to encrypt debug logs to be stored in the HDD.
- Be sure to set the encryption password. Failure to set the encryption password may hamper correct analysis of the log.

6. Try to reproduce the problem/malfunction on the MFP.
7. The problem/malfunction is reproduced.
8. Ask the administrator of the MFP to set [Administrator Settings] -> [Security Settings] -> [Security Details] -> [Export Debug Log] to [Allow].
9. Call the Debug Settings in Service Mode.
10. Set the USB password in [Debug Settings] -> [USB Password].

## NOTE

- The USB password set here must be same as the password set in the USB memory in advance preparation procedure.

11. Display [Debug Settings] -> [Debug Log Output] on the screen.
12. Connect the USB memory prepared in advance preparation to the USB port located on the right-side of the MFP control panel.
13. Touch [Select File]. Select the intended file and touch [Output] in [HDD -> USB Memory].
14. Check that the Start key lights up in blue, and press the Start key. NOTE

- If the Start key lights up orange, the USB password and/or MFP serial number on for the MFP do not match the key file.

15. [OK] will be displayed.
16. Touch [OK], and exit the Debug Settings.
17. Return the switch No. 155 to [00000000] at Bit assignment/[00] at HEX assignment in [Service Mode] -> [System 2] -> [Software Switch Setting].
18. Exit the Service Mode.
19. Remove the USB memory from the MFP and check that the USB memory contains the file of which name is "LOGSYS_xxxxxxxxxxx.log".
20. Send KM your request of analyzing the problem with the log file.

NOTE

- Send the USB password and log file(s) to the recipient of your request SEPARATELY.

### 9.4.2 Enhance mode

(1) Intended purpose

- To retrieve from the MFP more detailed program sequence log than that of Basic mode; for analyzing field problems caused by MFP controller program malfunction which could be difficult to reproduce in KM.

## NOTE

- CE should get permission from CUSTOMER before retrieving the program sequence logs from the customer's MFP.
- Please explain to the CUSTOMER that the MFP performance will be down during the procedure. The top priority of the MFP is to save the logs completely before starting the next job process; so the CUSTOMER will see a pause between jobs.
(2) Outline

1. Save the key file in the USB memory by using the Key generate utility on the PC.
2. Set the Debug Settings to "ON" in the Service Mode.
3. Sets an encryption word.
4. Select the target device (USB memory or HDD) to save the log files.

- When selecting USB memory as target, ask the administrator of the MFP to set [Administrator Settings] -> [Security Settings] -> [Security Details] -> [Export Debug Log] to [Allow].
- Connect the USB memory into the USB port on the right-rear side of the MFP.

5. Try to reproduce the problem/malfunction on the MFP.
6. The problem/malfunction is reproduced.
7. Remove the USB memory if you select USB memory as a target device.
8. When selecting HDD as target, ask the administrator of the MFP to set [Administrator Settings] -> [Security Settings] -> [Security Details]
-> [Export Debug Log] to [Allow].

- Select the debug log(s) that corresponds to the problem, and select "USB Memory" as the output destination and acquire the log(s).

9. Send the $\log (\mathrm{s})$ and the USB password to the department of KM from which you receive instructions SEPARATELY.

## (3) Details of the procedure

(a) Advance preparation

- Save a key file into a USB memory.

1. Set the USB Password on the Key generation utility.
2. Generate the Key file by typing in the Serial number (capital letter) of the target MFP.
3. Copy the created "Debug Log" folder into the root directory of the USB memory.

- Make sure that [Administrator Settings] -> [Security Settings] -> [Enhanced Security Mode] is set to OFF.
(b) Settings for acquiring logs (When selecting USB memory as a target device)

1. Get permission from the CUSTOMER to retrieve the program sequence logs from the MFP at the customer's site. NOTE

- They do not include the copy/scan/print/fax image data unless selecting printer. Logs include the MFP control program sequences only.
- The top priority of the MFP is to save the logs completely before starting the next job process; so the CUSTOMER will see a pause between jobs. Please explain to the CUSTOMER that the MFP performance will be down during the procedure.

2. Set the switch number "155" to "01" in HEX Assignment in [Service Mode] -> [System 2] -> [Software Switch Setting].
3. Call the Debug Settings to the screen.
4. Select [Enhance] in [Debug Settings] -> [Acquiring Mode].
5. Select the target logs.

NOTE

- DO NOT TOUCH the command settings (Individual Command and Command Set) without KM instructions.

6. Set the USB password in [Debug Settings] -> [USB Password].

NOTE

- The USB password set here must be same as the password set in the USB memory in advance preparation procedure.

7. Exit the Service Mode.
8. Ask the administrator of the MFP to set [Administrator Settings] -> [Security Settings] -> [Security Details] -> [Export Debug Log] to [Allow].
9. Connect the USB memory into the USB port on the right-rear side of the MFP.
10. Try to reproduce the problem/malfunction on MFP.

Cautions when saving log files each time the problem/malfunction is reproduced

- Saved Logs will not be overwritten. USB memory should have enough capacity to save the all logs.
- Debug log function will stop if USB memory is FULL.
- While saving the log data, a specific ICON will appear on the control panel. DO NOT REMOVE the USB memory when the ICON is displayed.

11. The problem/malfunction is reproduced.
12. Return the switch number "155" in HEX Assignment to "00" in [Service Mode] -> [System 2] -> [Software Switch Setting].
13. Exit the Service Mode.
14. Remove the USB memory from the MFP and check that the USB memory contains the file of which name is "LOGSYS_xxxxxxxxxxx.log".
15. Send KM your request of analyzing the problem with the log file. NOTE

- Send the USB password and log file(s) to the recipient of your request SEPARATELY.

## (c) Settings for acquiring logs (When selecting HDD as a target device)

1. Get permission from the CUSTOMER to retrieve the program sequence logs from the MFP at the customer's site. NOTE

- They do not include the copy/scan/print/fax image data unless selecting printer. Logs include the MFP control program sequences only.
- The top priority of the MFP is to save the logs completely before starting the next job process; so the CUSTOMER will see a pause between jobs. Please explain to the CUSTOMER that the MFP performance will be down during the procedure.

2. Set the switch number "155" to "01" in HEX Assignment in [Service Mode] -> [System 2] -> [Software Switch Setting].
3. Call the Debug Settings to the screen.
4. Select [Enhance] in [Debug Settings] -> [Acquiring Mode].
5. Select the target logs.

NOTE

- DO NOT TOUCH the command settings (Individual Command and Command Set) without KM instructions.

6. Set the USB password in [Debug Settings] -> [USB Password].

NOTE

- The USB password set here must be same as the password set in the USB memory in advance preparation procedure.

7. Exit the Service Mode.
8. Ask the administrator of the MFP to set a debug log encryption pass phrase in [Administrator Settings] -> [Security Settings] -> [HDD Settings] -> [Debug Log Encryption Settings]. (Default: 01234567890123456789)
NOTE

- This setting is used to encrypt debug logs to be stored in the HDD.
- Be sure to set the encryption password. Failure to set the encryption password may hamper correct analysis of the log.

9. Try to reproduce the problem/malfunction on the MFP.
10. The problem/malfunction is reproduced.
11. Ask the administrator of the MFP to set [Administrator Settings] -> [Security Settings] -> [Security Details] -> [Export Debug Log] to [Allow].
12. Call [Debug Settings] -> [Debug Log Output] to the screen.
13. Connect the USB memory prepared in advance preparation to the USB port located on the right-side of the MFP control panel.
14. Touch [Select File]. Select the intended file and touch [Output] in [HDD -> USB Memory].
15. Check that the Start key lights up in blue, and press the Start key.

## NOTE

- If the Start key lights up orange, the USB password and/or MFP serial number on for the MFP do not match the key file.

16. [OK] will be displayed.
17. Touch [END], and exit the Debug Settings.
18. Return the switch number "155" in HEX Assignment to "00" in [Service Mode] -> [System 2] -> [Software Switch Setting].
19. Exit the Service Mode.
20. Remove the USB memory from the MFP and check that the USB memory contains the file of which name is "LOGSYS_xxxxxxxxxxx.log".
21. Send KM your request of analyzing the problem with the log file.

NOTE

- Send the USB password and log file(s) to the recipient of your request SEPARATELY.

## 11. MECHANICAL ADJUSTMENT bizhub C368/C308/C258

### 11.1 Scanner section

### 11.1.1 Adjustment of the scanner motor belt

(1) Purpose

This adjustment must be made in the following case:

- The scanner motor assy has been removed.
(2) Procedure
[2] [3]

[2]

[2]
[2]
[1]

1. Attach the spring [3] to the scanner motor assy [1].
2. Temporarily secure the scanner motor assy [1] with three screws [2]. NOTE

- The screws [2] should be temporarily tightened to a degree that the position of the motor can be adjusted by the spring force.
- When installing the scanner motor, make sure that the scanner motor is disconnected with the connector.

3. Attach the drive belt [2] to the pulley [1] and the gear of scanner motor.
4. Move the scanner motor assy [3] in the direction shown in the illustration for two to three times, then make sure that it runs smoothly.
NOTE

- Make sure that the drive belt [2] is properly kept tight by the spring [4] force.
- If the deflection or tension of the drive belt [2] is excessive, the scanner unit does not work correctly. This may result in trouble.
- Make sure that the drive belt [2] is attached to the pulley [1] correctly.

5. Tighten three screws [1] in the order shown in the illustration to fix the scanner motor assy.
6. Connect the connector [3] to the scanner motor.

## NOTE

- When tightening the screw [1], make sure that the scanner motor assy is not touched.
- After securing the scanner motor assy, check again that the deflection and tension of the drive belt [2] are not excessive.

### 11.2 Paper feed section

11.2.1 Centering adjustment of the tray $1 / 2$
(1) Purpose

This adjustment must be made in the following case:

- When an image printed on a copy is displaced from the correct position with the use of the tray $1 / 2$.
(2) Procedure

1. Make a test print and check the amount of misalignment.
2. Pull out the tray where this adjustment is made.
3. Stretch the paper guides [1] to the maximum size position.

4. Loosen two screws [1].

5. Move the paper guides [1] complete according to the amount of the miscentering you checked in step 1 and adjust the center position of it.
6. Tighten two screws [2].

7. Make another test print and check the amount of misalignment.

### 11.2.2 Pick-up pressure adjustment of the tray $\mathbf{1 / 2}$

(1) Purpose

This adjustment must be made in the following case:

- When paper jam occurs while thin paper $\left(52 \mathrm{~g} / \mathrm{m}^{2}\right)$ is fed.

## (2) Procedure

1. Remove the paper feed unit.
G.5.3.2 Paper feed unit

2. Remove the spring [1] stored for replacement from the paper feed unit.

3. Remove the C-clip [1], and remove the tray 2 pick-up roller [2].
4. Remove the bushing [1].
5. Remove two E-rings [1], and remove the shaft [2] of the pick-up roller.
6. Remove the spring [1] and replace it with the replacement spring prepared in step 2.
NOTE

- The pick-up pressure of the tray 1 can be adjusted by replacing the spring of the tray 1 paper feed unit with the replacement spring prepared in step 2.

7. To reinstall, reverse the order of removal.
8. Make a test print to check whether paper is fed properly.

### 11.2.3 Separator roller pressure adjustment of the bypass tray

## (1) Purpose

This adjustment must be made in the following case:

- When paper jam occurs with a specific type of thick paper $\left(300 \mathrm{~g} / \mathrm{m}^{2}\right)$ is fed.
(2) Procedure

1. Open the right door.
2. Remove the screw [1], and remove the cover [2].

3. Hold the edge of the spring [1] with a plier, etc, to pull it off the hook part [2].
4. Hook the edge of the removed spring to the hook part [3] shown on the illustration.
5. Make a test print to check whether paper is fed properly.
6. When returning the pressure to the original status, return the hook of the spring in reverse steps.

### 11.2.4 Adjustment of the bypass CD paper size VR

(1) Purpose

This adjustment must be made in the following case:

- The bypass CD paper size VR has been removed.
(2) Procedure

1. Align the match mark [1] on the bypass guide rack gear with the groove on the gear rim at two places and install two bypass guide rack gears [2].
2. When installing the bypass $C D$ paper size VR assy [3], make sure that the part [1] (pointed by the arrow) on the bypass guide rack gear and the gear's hole [2] on the bypass CD paper size VR assy are placed in a straight line.
3. Secure the bypass $C D$ paper size VR assy with two screws.
4. After the bypass CD paper size VR base has been mounted, check that the lever of the bypass $C D$ paper size $V R$ moves smoothly in a manner operatively connected to the bypass guide.
5. Call the Service Mode to the screen and select [Machine] -> [Manual Bypass Tray Width Adj]. Then, carry out manual bypass tray width adjustment.

### 11.3 Fusing section

### 11.3.1 Adjusting the parallelism of the fusing unit path

## (1) Purpose

This adjustment must be made in the following case:

- When the second transfer paper feed path and the fusing section path are not parallel and caused wrinkles on the paper.

## (2) Procedure

1. Remove the fusing unit.
F.7.9.1 Replacing the fusing unit
2. Remove the screw [1] for the fusing unit positioning material.

3. Remove the screw [1], and remove the fusing unit positioning material [2].
4. 0.6 mm adjusting shim plate [1] is installed as the standard status. Add or reduce the number of shims to adjust the parallelism.

- Removing the standard adjusting shim plate: The fusing unit mounting position (front side) will move down by 0.6 mm .
- Adding one adjusting shim plate: The fusing mounting position (front side) will move up by 0.6 mm .
Adjusting shim plate parts number: A161 1126\#\#

5. To reinstall, reverse the order of removal.
6. Make a test print to check whether paper is fed properly.

## 12. MECHANICAL ADJUSTMENT bizhub C658/C558/C458

### 12.1 Scanner section

### 12.1.1 Adjustment of the scanner motor belt

(1) Purpose

This adjustment must be made in the following case:

- The scanner motor assy has been removed.
(2) Procedure

1. Attach the spring [3] to the scanner motor assy [1].
2. Temporarily secure the scanner motor assy [1] with three screws [2]. NOTE

- The screws [2] should be temporarily tightened to a degree that the position of the motor can be adjusted by the spring force.
- When installing the scanner motor, make sure that the scanner motor is disconnected with the connector.

3. Attach the drive belt [2] to the pulley [1] and the gear of scanner motor.
4. Move the scanner motor assy [3] in the direction shown in the illustration for two to three times, then make sure that it runs smoothly.
NOTE

- Make sure that the drive belt [2] is properly kept tight by the spring [4] force.
- If the deflection or tension of the drive belt [2] is excessive, the scanner unit does not work correctly. This may result in trouble.
- Make sure that the drive belt [2] is attached to the pulley [1] correctly.

5. Tighten three screws [1] in the order shown in the illustration to fix the scanner motor assy.
6. Connect the connector [3] to the scanner motor.

NOTE

- When tightening the screw [1], make sure that the scanner motor assy is not touched.
- After securing the scanner motor assy, check again that the deflection and tension of the drive belt [2] are not excessive.
12.1.2 Skew Adj.
(1) Purpose

This adjustment must be made in the following case:

- Images are tilted when scanning or copying images.

## NOTE

- Perform a test print and make sure the printed image is not tilted.
- If printed images are tilted, make adjustments from [Service Mode] -> [Machine] -> [Printer Area] before making this adjustment.
- After performing the print head skew adjustment, perform the [Scan Area] function from [Service Mode] -> [Machine].
(2) Confirmation procedure

(3) Adjustment procedure

1. Remove the scanner left cover.
G.6.2.4 Scanner left cover

[1]

[1]
2. Prepare a chart to check for tilting.
3. Set the test chart on the original document glass. NOTE

- Set the test chart against the original document scale and make sure the gap between the test chart and original document scale is 0.3 mm or less.

3. Make sure the original document cover is completely closed.
4. Press the Start key to make a copy.
5. Check copy for image tilting.
6. Perform the following adjustment if the image tilt (different between width $A$ and width $B$ ) is more than the standard of $\pm 1.4 \mathrm{~mm}$.
7. Record the default value [1] before making adjustments.
8. Loosen eight screws [1].

### 12.2 Document feed section

### 12.2.1 Centering adjustment of the tray $1 / 2$

(1) Purpose

This adjustment must be made in the following case:

- When an image printed on a copy is displaced from the correct position with the use of the tray1/2.

## (2) Procedure

1. Make a test print and check the amount of misalignment.
2. Pull out the tray where this adjustment is made.
3. Stretch the paper guides [1] to the maximum size position.

[1]

[^42]
5. Move the paper guides [1] complete according to the amount of the miscentering you checked in step 1 and adjust the center position of it.

6. Tighten two screws [2]
7. Make another test print and check the amount of misalignment.

### 12.2.2 Pick-up pressure adjustment of the tray $1 / 2$

## (1) Purpose

This adjustment must be made in the following case:

- When paper jam occurs while thin paper ( $52 \mathrm{~g} / \mathrm{m}^{2}$ ) is fed.

## (2) Procedure

1. Remove the paper feed unit.
G.6.3.2 Paper feed unit

2. Remove the spring [1] stored for replacement from the paper feed unit.
3. Release the tab [1], and remove the tray 2 pick-up roller [2].
4. Remove the bushing [1].

[1]
5. Remove two E-rings [1], and remove the shaft [2] of the pick-up roller.
6. Remove the spring [1] and replace it with the replacement spring prepared in step 2.
NOTE

- The pick-up pressure of the tray 1 can be adjusted by replacing the spring of the tray 1 paper feed unit with the replacement spring prepared in step 2.

7. To reinstall, reverse the order of removal.
8. Make a test print to check whether paper is fed properly.

### 12.2.3 Separator roller pressure adjustment of the bypass tray

(1) Purpose

This adjustment must be made in the following case:

- When paper jam occurs with a specific type of thick paper $\left(300 \mathrm{~g} / \mathrm{m}^{2}\right)$ is fed.

## (2) Procedure

1. Open the right door.
2. Remove the screw [1], and remove the cover [2].

[2]
[1]

3. Hold the edge of the spring [1] with a plier, etc, to pull it off the hook part [2]
4. Hook the edge of the removed spring to the hook part [3] shown on the illustration.

### 12.2.4 Adjustment of the bypass CD paper size VR

## (1) Purpose

This adjustment must be made in the following case:

- The bypass CD paper size VR has been removed.
(2) Procedure
[2]

[1]

1. Align the match mark [1] on the bypass guide rack gear with the groove on the gear rim at two places and install two bypass guide rack gears [2].
2. When installing the bypass $C D$ paper size VR assy [3], make sure that the alignment mark [1] on the bypass guide rack gear and the gear hole [2] on the bypass CD paper size VR assy are placed in a straight line.
3. Secure the bypass CD paper size VR assy with four screws.

4. After the bypass CD paper size VR base has been mounted, check that the lever of the bypass CD paper size VR moves smoothly in a manner operatively connected to the bypass guide.
5. Call the Service Mode to the screen and select [Machine] -> [Manual Bypass Tray Width Adj]. Then, carry out manual bypass tray width adjustment.

### 12.3 Fusing section

### 12.3.1 Adjusting the parallelism of the fusing unit path

## (1) Purpose

This adjustment must be made in the following case:

- When the second transfer paper feed path and the fusing section path are not parallel and caused wrinkles on the paper.

## (2) Procedure

1. Remove the fusing unit.
F.8.10.1 Replacing the fusing unit (bizhub C658/C558)
F.8.10.2 Replacing the fusing unit (bizhub C458)
[3]

[2]
[1]
2. Remove the screw [1] for the fusing unit positioning material
3. Remove the screw [2], and remove the fusing unit positioning material [3].
4. 0.6 mm adjusting shim plate [1] is installed as the standard status. Add or reduce the number of shims to adjust the parallelism.

- Removing the standard adjusting shim plate: The fusing unit mounting position (front side) will move down by 0.6 mm .
- Adding one adjusting shim plate: The fusing mounting position (front side) will move up by 0.6 mm .
Adjusting shim plate parts number: A161 1126\#\#

5. To reinstall, reverse the order of removal.
6. Make a test print to check whether paper is fed properly.

## 13. MECHANICAL ADJUSTMENT dual scan document feeder

### 13.1 Original document feed section

### 13.1.1 Adjusting the height

(1) Purpose

This adjustment must be made in the following case:

- When the dual scan document feeder has been reinstalled.
(2) Procedure

1. Check the clearance between the upper face of scanner and the protrusion [1] on the dual scan document feeder side (2 spots).

2. NOTE

- There must be no clearance between the protrusion [1] on the dual scan document feeder and the upper face of scanner.

3. If there is any clearance, the following adjustment is needed.
4. Remove the clearance by turning the adjusting screw [1]

- Clockwise rotation: Lifting up the rear side
- Counterclockwise rotation: Lowering the rear side

5. Use the adjusting screw [2] when further adjustment is needed.

- Clockwise rotation: Lifting up the rear side
- Counterclockwise rotation: Lowering the rear side
13.1.2 Adjusting front side skew feed on dual scan document feeder
(1) Purpose

This adjustment must be made in the following case:

- When the dual scan document feeder has been reinstalled.

## (2) Procedure

1. Call the Service Mode to the screen, and measure the DF skew.
[Service Mode] -> [ADF] -> [Skew Measurement] -> [DFSkew (Front)]
2. If the [Avg. Value] of measurement result does not fall within the "standard range", perform the following adjustment.
3. Loosen the mounting screw [1] on the right hinge viewed from the front.

4. If " 1.0 " is displayed in the [Scale], turn the adjuster screw clockwise to move the scale scribe line one graduation in the " + " direction.
Example: If the scribe line is on graduation "3" before adjusting, adjust the scribe line to graduation "4".
NOTE

- Look at the guide lines [2] when making the adjustment.
- Be sure not to turn the adjustment screw [1] when the dual scan document feeder is opened at 90 degrees to prevent the screw from being broken.

5. If "-1.0" is displayed in the [Scale], turn the adjuster screw counterclockwise to move the scale scribe line one graduation in the "-" direction. Example: If the scribe line is on graduation "3" before adjusting, adjust the scribe line to graduation "2".
NOTE

- Look at the guide lines [2] when making the adjustment.
- Be sure not to turn the adjustment screw [1] when the dual scan document feeder is opened at 90 degrees to prevent the screw from being broken.

6. After the adjustment is completed, tighten the mounting screw [1] on right side hinge securely with screwdriver.
7. Re-scan the chart five times by selecting [Service Mode] -> [ADF] -> [Skew Measurement] -> [DFSkew(Front)] and measure the average Skew value.
8. Check the [Avg. Value] is within the "specified range".
9. If the value of [Avg. Value] does not fall within the "specified range", repeat the adjustment.

### 13.1.3 Adjusting back side skew feed on dual scan document feeder

(1) Purpose

This adjustment must be made in the following case:

- When the dual scan document feeder has been reinstalled.
- When the CIS module has been reinstalled.

## (2) Procedure

1. Call the Service Mode to the screen, and measure the DF skew.
[ADF] -> [Skew Measurement] -> [DFSkew (Back)]
2. If the [Avg. Value] of measurement result does not fall within the "standard range", perform the following adjustment.
3. Remove the front cover of the dual scan document feeder.
G.7.2.1 Front cover (dual scan document feeder)

4. Loosen two screws [1]
5. Depending on the difference of the Skew value, turn the adjustment dial [1] to make adjustments.

- When the difference is a positive (+) value, turn the dial clockwise.
- When the difference is a negative (-) value, turn the dial counterclockwise.

6. After completing the adjustment, tighten the screw loosened in step 4.
7. Re-scan the chart five times by selecting [Service Mode] -> [ADF] -> [Skew Measurement] -> [DFSkew(Back)] and measure the average Skew value.
8. Check the [Avg. Value] is within the "specified range"
9. If the value of [Avg. Value] does not fall within the "specified range", repeat the adjustment.
10. Install the front cover.

### 13.1.4 Adjusting the pressure of the separation roller

## (1) Purpose

This adjustment must be made in the following case. The adjustment can also be performed in three levels.

- When document misfeed often occurs.
(2) Procedure

1. Open the left cover [1].

[1]

[2]

2. To reinstall, reverse the order of removal.

### 13.1.5 Adjusting multi-feed detection UK-501

1. Remove the rear cover.
G.7.2.2 Rear cover (dual scan document feeder)

2. Press the Menu key to close the Paper Jam screen.
3. Call the Service Mode to the screen.
4. Touch [ADF] -> [Multi-Feed DetectionAdj].
5. Press the Start key.

The Check Value is displayed.
3. Remove three screws [1], and remove three pins [2].
4. Lift up the document feed tray [1].
5. Remove the screw [1].
6. Grasp the part [2], perform adjustment by moving it along the groove [3] of the metal plate. NOTE

- Move upward, the spring force becomes stronger.
- Move downward, the spring force becomes weaker.

2. Set the supplied adjustment sheet [1] on the detection area of the multi feed detection sensor, as shown in the illustration, then close the left cover [2].

3. Press the Stop key.
4. Touch [END] -> [Exit] on the Service Mode screen.

5. Close the left cover.
6. Turn OFF and ON the power switch.

NOTE

- When displayed the Service Mode screen, be sure to turn off the power after exiting the Service Mode screen and wait for 10 seconds or more before turning on.

## 14. MECHANICAL ADJUSTMENT DF-629

### 14.1 Original document feed section

### 14.1.1 Adjusting the height

## (1) Purpose

This adjustment must be made in the following case:

- When the reverse automatic document feeder has been reinstalled.
(2) Procedure

1. Check the clearance between the upper face of scanner and the protrusion [1] on the reverse automatic document feeder side (3 spots).
NOTE

- There must be no clearance between the protrusion [1] on the reverse automatic document feeder and the upper face of scanner.

2. If there is any clearance, the following adjustment is needed.
3. Remove the clearance by turning the adjusting screw [1].

- Clockwise rotation: Lifting up the rear side
- Counterclockwise rotation: Lowering the rear side

4. Use the adjusting screw [2] when further adjustment is needed.

- Clockwise rotation: Lifting up the rear side
- Counterclockwise rotation: Lowering the rear side

### 14.1.2 Adjusting front side skew feed on ADF

(1) Purpose

This adjustment must be made in the following case:

- When the reverse automatic document feeder has been reinstalled.
(2) Procedure

1. Call the Service Mode to the screen, and measure the DF skew.
[Service Mode] -> [ADF] -> [Skew Measurement] -> [DFSkew (Front)]
2. If the [Avg. Value] of measurement result does not fall within the "standard range", perform the following adjustment.
3. Loosen the mounting screw [1] on the right hinge viewed from the front.

[1]

[1]

4. If " 1.0 " is displayed in the [Scale], turn the adjuster screw clockwise to move the scale scribe line one graduation in the " + " direction.
Example: If the scribe line is on graduation " 3 " before adjusting, adjust the scribe line to graduation "4".

## NOTE

- Look at the guide lines [2] when making the adjustment.
- Be sure not to turn the adjustment screw [1] when the reverse automatic document feeder is opened at 90 degrees to prevent the screw from being broken.

5. If "-1.0" is displayed in the [Scale], turn the adjuster screw counterclockwise to move the scale scribe line one graduation in the "-" direction. Example: If the scribe line is on graduation " 3 " before adjusting, adjust the scribe line to graduation "2".

## NOTE

- Look at the guide lines [2] when making the adjustment.
- Be sure not to turn the adjustment screw [1] when the reverse automatic document feeder is opened at 90 degrees to prevent the screw from being broken.

6. After the adjustment is completed, tighten the mounting screw [1] on right side hinge securely with screwdriver.
7. Re-scan the chart five times by selecting [Service Mode] -> [ADF] -> [Skew Measurement] -> [DFSkew(Front)] and measure the average Skew value.
8. Check the [Avg. Value] is within the "specified range".
9. If the value of [Avg. Value] does not fall within the "specified range", repeat the adjustment.

### 14.1.3 Adjusting the pressure of the separation roller

## (1) Purpose

This adjustment must be made in the following case: The adjustment is available in two different levels.

- Original misfeed often occurs.

## (2) Procedure

1. Open the left cover [1].

2. Grip both sides [1] of the holder and remove the cover [2].
3. Remove the spacer [1] shown on the illustration.
4. Set the spacer to the lower part of the spring in the direction shown on the illustration (with deeper groove facing upper side).
NOTE

- When this procedure does not improve the situation, carry out the adjustment below for the stronger spring force.

5. Set the spacer to the lower part of the spring in the direction shown on the illustration (with shallow groove facing upper side).

## 15. MECHANICAL ADJUSTMENT DF-704

### 15.1 Original document feed section

### 15.1.1 Adjusting the height

(1) Purpose

This adjustment must be made in the following case:

- When the dual scan document feeder has been reinstalled.
(2) Procedure

1. Check the clearance between the upper face of scanner and the protrusion [1] on the dual scan document feeder side (3 spots).
NOTE

- There must be no clearance between the protrusion [1] on the dual scan document feeder and the upper face of scanner.

2. If there is any clearance, the following adjustment is needed.
3. Remove the clearance by turning the adjusting screw [1].

- Clockwise rotation: Lifting up the rear side
- Counterclockwise rotation: Lowering the rear side

4. Use the adjusting screw [2] when further adjustment is needed.

- Clockwise rotation: Lifting up the rear side
- Counterclockwise rotation: Lowering the rear side

### 15.1.2 Adjusting front side skew feed on ADF

## (1) Purpose

This adjustment must be made in the following case:

- When the dual scan document feeder has been reinstalled.

## (2) Procedure

1. Call the Service Mode to the screen, and measure the DF skew. [Service Mode] -> [ADF] -> [Skew Measurement] -> [DFSkew (Front)]
2. If the [Avg. Value] of measurement result does not fall within the "standard range", perform the following adjustment.
3. Loosen the mounting screw [1] on the right hinge viewed from the front.

4. If " 1.0 " is displayed in the [Scale], turn the adjuster screw clockwise to move the scale scribe line one graduation in the " + " direction.
Example: If the scribe line is on graduation " 3 " before adjusting, adjust the scribe line to graduation "4".

## NOTE

- Look at the guide lines [2] when making the adjustment.
- Be sure not to turn the adjustment screw [1] when the dual scan document feeder is opened at 90 degrees to prevent the screw from being broken.

5. If "-1.0" is displayed in the [Scale], turn the adjuster screw counterclockwise to move the scale scribe line one graduation in the "-" direction.
Example: If the scribe line is on graduation " 3 " before adjusting, adjust the scribe line to graduation "2".

## NOTE

- Look at the guide lines [2] when making the adjustment.
- Be sure not to turn the adjustment screw [1] when the dual scan document feeder is opened at 90 degrees to prevent the screw from being broken.

6. After the adjustment is completed, tighten the mounting screw [1] on right side hinge securely with screwdriver.
7. Re-scan the chart five times by selecting [Service Mode] -> [ADF] -> [Skew Measurement] -> [DFSkew(Front)] and measure the average Skew value.
8. Check the [Avg. Value] is within the "specified range".
9. If the value of [Avg. Value] does not fall within the "specified range", repeat the adjustment.

### 15.1.3 Adjusting back side skew feed on ADF

## (1) Purpose

This adjustment must be made in the following case:

- When the dual scan document feeder has been reinstalled.
- When the CIS module has been reinstalled.

## (2) Procedure

1. Call the Service Mode to the screen, and measure the DF skew.
[ADF] -> [Skew Measurement] -> [DFSkew (Back)]
2. If the [Avg. Value] of measurement result does not fall within the "standard range", perform the following adjustment.
3. Remove the front cover of the dual scan document feeder.
G.8.4.1 Front cover (DF-704)

4. Loosen two screws [1].

5. Depending on the difference of the Skew value, turn the adjustment dial [1] using the marks [2] as a guide.

- When the difference is a positive (+) value, turn the dial clockwise.
- When the difference is a negative (-) value, turn the dial counterclockwise.

6. After completing the adjustment, tighten the screw loosened in step 4.
7. Re-scan the chart five times by selecting [Service Mode] -> [ADF] -> [Skew Measurement] -> [DFSkew(Back)] and measure the average Skew value.
8. Check the [Avg. Value] is within the "specified range".
9. If the value of [Avg. Value] does not fall within the "specified range", repeat the adjustment.
10. Install the front cover.

### 15.1.4 Adjusting the pressure of the separation roller

## (1) Purpose

This adjustment must be made in the following case: The adjustment is available in two different levels.

- Original misfeed often occurs.
(2) Procedure

> 1. Open the left cover [1].

[1]
[1]

[2]
2. Grip both sides [1] of the holder and remove the cover [2].
3. Remove the spacer [1] shown on the illustration.

[1]

4. Set the spacer to the lower part of the spring in the direction shown on the illustration (with deeper groove facing upper side).
NOTE

- When this procedure does not improve the situation, carry out the adjustment below for the stronger spring force.

5. Set the spacer to the lower part of the spring in the direction shown on the illustration (with shallow groove facing upper side).

## 16. MECHANICAL ADJUSTMENT PC-110/PC-210

### 16.1 Paper reference position

### 16.1.1 Purpose

This adjustment must be made in the following case:

- When the PH unit has been replaced.
- When the image on the print is offset in the main scan direction.
- When adjustment in [Service Mode] -> [Machine] -> [Printer Area] -> [Printer Image Centering Side 1] does not resolve a problem. NOTE
- When optional finisher FS-534 or FS-534SD is installed, mechanical adjustment is necessary before adjustment [Printer Image Centering Side 1].

### 16.1.2 Procedure

1. Measure the width of printed reference line $A$. Target: $3.0 \mathrm{~mm} \pm 1.0 \mathrm{~mm}$

2. Slide out the tray [1] and unload paper from it.
3. Loosen three screws [2] at the center of the paper lifting plate.

4. Watching the graduations [1] provided in the drawer, move the paper width guide [2] in the rear

- If width $A$ is greater than the target, move the paper width guide toward the front.
- If width A is smaller than the target, move the paper width guide toward the rear.

5. Tighten three screws which have been loosened.
6. Perform another test print and check the reference deviation.

## 17. MECHANICAL ADJUSTMENT PC-115/PC-215

### 17.1 Paper reference position

### 17.1.1 Purpose

This adjustment must be made in the following case:

- When the PH unit has been replaced.
- When the image on the print is offset in the main scan direction.
- When adjustment in [Service Mode] -> [Machine] -> [Printer Area] -> [Printer Image Centering Side 1] does not resolve a problem. NOTE
- When optional finisher FS-536, FS-536SD, FS-537, or FS-537SD is installed, mechanical adjustment is necessary before adjustment [Printer Image Centering Side 1].

### 17.1.2 Procedure

1. Measure the width of printed reference line $A$. Target: $3.0 \mathrm{~mm} \pm 1.0 \mathrm{~mm}$
2. Slide out the tray [1] and unload paper from it.

[1]
3. Loosen three screws [2] at the center of the paper lifting plate.

4. Watching the graduations [1] provided in the drawer, move the paper width guide [2] in the rear

- If width $A$ is greater than the target, move the paper width guide toward the front.
- If width A is smaller than the target, move the paper width guide toward the rear.

5. Tighten three screws which have been loosened.
6. Perform another test print and check the reference deviation.

## 18. MECHANICAL ADJUSTMENT PC-410

### 18.1 Paper reference position

### 18.1.1 Purpose

This adjustment must be made in the following case:

- When the PH unit has been replaced.
- When the image on the print is offset in the main scan direction.
- When adjustment in [Service Mode] -> [Machine] -> [Printer Area] -> [Printer Image Centering Side 1] does not resolve a problem. NOTE
- When optional finisher FS-534 or FS-534SD is installed, mechanical adjustment is necessary before adjustment [Printer Image Centering Side 1].

### 18.1.2 Procedure

1. Measure the width of printed reference line $A$. Target: $3.0 \mathrm{~mm} \pm 1.0 \mathrm{~mm}$
2. Slide out the paper feed tray [1] and unload paper from it.

[2]
[1]
[2]

3. Watching the graduations [1] provided near the screws, move the front cover assy [2].

- If width $A$ is greater than the target, move the front cover assy toward the rear.
- If width $A$ is smaller than the target, move the front cover assy toward the front.

5. Tighten six screws which have been loosened
6. Perform another test print and check the reference deviation.

### 18.2 Shifter movement timing belt adjustment

### 18.2.1 Procedure

1. Remove the paper feed tray. G.8.7.4 Paper feed tray (PC-410)

2. While raising the main tray [1], and remove two screws [2] that hold the shift tray in position.
NOTE

- When reinstalling, use caution because the wire of the main tray [1] comes off easily.

3. Remove the shift tray [3].

[1]
4. Move the sifter.
5. Loosen the tension pulley assy fixing screw [1] and move it in the direction of the arrow.
6. After moving the shifter, tighten the tension pulley assy fixing screw [1].

## 19. MECHANICAL ADJUSTMENT PC-415

### 19.1 Paper reference position

### 19.1.1 Purpose

This adjustment must be made in the following case:

- When the PH unit has been replaced.
- When the image on the print is offset in the main scan direction.
- When adjustment in [Service Mode] -> [Machine] -> [Printer Area] -> [Printer Image Centering Side 1] does not resolve a problem. NOTE
- When optional finisher FS-536, FS-536SD, FS-537, or FS-537SD is installed, mechanical adjustment is necessary before adjustment [Printer Image Centering Side 1].

### 19.1.2 Procedure

1. Measure the width of printed reference line $A$. Target: $3.0 \mathrm{~mm} \pm 1.0 \mathrm{~mm}$
2. Slide out the paper feed tray [1] and unload paper from it.

[2]
[1]
[2]

3. Watching the graduations [1] provided near the screws, move the front cover assy [2].

- If width $A$ is greater than the target, move the front cover assy toward the rear.
- If width $A$ is smaller than the target, move the front cover assy toward the front.

5. Tighten six screws which have been loosened
6. Perform another test print and check the reference deviation.

### 19.2 Shifter movement timing belt adjustment

### 19.2.1 Procedure

1. Slide out the paper feed tray.

[1]
2. While raising the main tray [1], and remove two screws [2] that hold the shift tray in position.
NOTE

- When reinstalling, use caution because the wire of the main tray [1] comes off easily.

3. Remove the shift tray [3].
4. Move the sifter.
5. Loosen the tension pulley assy fixing screw [1] and move it in the direction of the arrow.
6. After moving the shifter, tighten the tension pulley assy fixing screw [1].

## 20. MECHANICAL ADJUSTMENT LU-207

### 20.1 Paper feed section

### 20.1.1 Changing the paper size

## (1) Purpose

This adjustment must be made in the following case:

- The user wants to change the size of paper being fed.
(2) Procedure

1. Open the upper door of the paper feed unit.

[2]
2. Remove six screws [1] and remove the paper guide side plate [2].
3. Match the paper guide side plate [2] to the size of the loaded paper.
4. Reinstall six screws [1] to attach the paper guide side plate [2].

5. From [Service Mode] -> [System 2] -> [LCT Paper Size Setting], select the tray in which the paper size will be changed and change the paper size.

### 20.1.2 Centering adjustment of the LCT

## (1) Purpose

This adjustment must be made in the following case:

- When adjustment in [Service Mode] -> [Machine] -> [Printer Area] -> [Printer Image Centering Side 1] does not resolve a problem.

## (2) Procedure

1. Call the Service Mode to the screen.
2. Touch [Machine].
3. Touch [Printer Area].
4. Touch [Printer Image Centering Side 1].
5. Touch [LCT].
6. Press the Start key to let the main body produce a test print.

7. Measure the width of printed reference line $A$. Target $A: 3.0 \mathrm{~mm} \pm 1.5 \mathrm{~mm}$
8. If the measured width A falls outside the target, enter the correction value using the [-] or [+] key.
9. Produce another test print and check to see if width A falls within the target.
10. If the use of the $[-]$ or $[+]$ key does not allow the measurement to fall within the target, perform the following steps.
11. Open the upper door of the LCT to loosen eight screws [1].

NOTE

- During adjustment, in order to keep the same distance between the paper guide side plates, place a sheet of paper between the paper guide side plates with 1.0 mm apart from each of the plates.

12. When width $A$ is larger than the target. Move the paper guide side plates [2] to the left and tighten eight loosened screws [1].
13. Load paper and let the main body produce another test print. Then, check width A.
14. Make the adjustment until width $A$ falls within the target.

### 20.1.3 Pick-up roller load adjustment of the LCT

(1) Purpose

This adjustment must be made in the following case:

- Incase a no feed jam occurs frequently, perform the pick-up roller load adjustment.
(2) Procedure

1. Open the upper door.
[1]

[2]
2. Remove the screw ( $\mathrm{M} 3 \times 10 \mathrm{~mm}: \mathrm{V} 1160310$ 03) [1] and remove the paper assist plate assy [2].
[2]

[1]

3. Remove the screw [1] and remove the assist handle [2].
4. Add one more paper assist plate (A03N $5604 \mathrm{\#} \mathrm{\#})$ [1] to the original ones. NOTE

- Adding only one paper assist plate is allowed and the total needs to be up to four.

5. Reinstall the assist handle that was removed in step 3, securing it with the screw.
6. Reinstall the paper assist plate assy with a new screw (M3 X 12 mm : V116 0312 03). The screw removed in step 2 (M3 X 10 mm : V116 031003 ) cannot be used to reinstall the assy.
7. Close the upper door.
8. Perform copying/printing to check whether the no feed or the double feed occurs or not.

## 21. MECHANICAL ADJUSTMENT LU-302

### 21.1 Paper feed section

### 21.1.1 Centering adjustment of the LCT

## (1) Purpose

This adjustment must be made in the following case:

- When adjustment in [Service Mode] -> [Machine] -> [Printer Area] -> [Printer Image Centering Side 1] does not resolve a problem.
(2) Procedure

1. Call the Service Mode to the screen.
2. Touch [Machine].
3. Touch [Printer Area].
4. Touch [Centering].
5. Touch [LCT].
6. Press the Start key to let the machine produce a test print.

7. If the measured width $A$ falls outside the target, enter the correction value using the $[-]$ or $[+]$ key.
8. Produce another test print and check to see if width A falls within the target.
9. If the use of the $[-]$ or $[+]$ key does not allow the measurement to fall within the target, perform the following steps.

10. Open the upper door on LCT to loosen four screws [1].

NOTE

- During adjustment, in order to keep the same distance between the paper guide side plates, place a sheet of paper [2] between the paper guide side plates with 1.0 mm apart from each of the plates.

12. When the width $A$ is larger than the target. Move the paper guide side plates [2] leftward and tighten four loosened screws [1].

13. When the width $A$ is smaller than the target. Move the paper guide side plates [2] rightward and tighten four loosened screws [1].
14. Load paper and let the machine produce another test print. Then, check width A.
15. Make the adjustment until width A falls within the target.

### 21.1.2 Pick-up roller load adjustment of the LCT

## (1) Purpose

This adjustment must be made in the following case:

- Incase a no feed jam occurs frequently, perform the pick-up roller load adjustment.
(2) Procedure

1. Open the upper door.
[1]

[2]
[2]

[1]

2. Remove the screw (M3 x $8 \mathrm{~mm}: \mathrm{V} 1160308$ 03) [1] and remove the paper assist plate assy [2].
3. Remove the screw [1] and remove the assist handle [2].
4. Add one more paper assist plate (A03N $5604 \mathrm{\#} \mathrm{\#}$ ) [1] to the original ones. NOTE

- Up to four paper assist plates can be added. (Standard: three)

5. Reinstall the assist handle that was removed in step 3, securing it with the screw.
6. Reinstall the paper assist plate assy with a new screw (M3 X 10 mm : V118 0310 03). The screw removed in step 2 (M3 X 8 mm : V116 0308 03) cannot be used to reinstall the assy.
7. Close the upper door.
8. Perform copying/printing to check whether the no feed or the double feed occurs or not.

## 22. MECHANICAL ADJUSTMENT PK-519

### 22.1 Punch section

### 22.1.1 Punch hole deviation correction

## (1) Purpose

This adjustment must be made in the following case:

- The punch holes are on a slanted line.

## (2) Procedure

1. Set the mode to Punch mode for printing.
2. Hold the output paper half and check the displacement of the punch hole. Target: $0 \pm 2.0 \mathrm{~mm}$
3. If the positional deviation of the punch holes is not within the target range, take the following steps.
4. Slide the finisher by pulling its lever
5. Remove the C-clip [1], and remove the lever [2].
6. Remove the screw [1], and remove the cover [2].
7. Loosen two screws [1].

8. Move the punch unit [1] back and forth to adjust its position, referring to the guide lines.
9. To reinstall, reverse the order of removal.
10. Make a copy and check the punch hole positions again.

## 23. MECHANICAL ADJUSTMENT PK-520

### 23.1 Punch section

### 23.1.1 Punch hole deviation correction

## (1) Purpose

This adjustment must be made in the following case

- The punch holes are on a slanted line.

## (2) Procedure

Ex. 1

Ex. 2

Ex. 3

1. Make a 1 sided copy sample in the punch mode. Face the printed surface upward.

- [A]: The distance between holes
- [B]: Paper feeding direction
- [a]: Upper punch hole
- [b]: Lower punch hole

2. Fold the paper in half along the center in the paper feeding direction.
3. Measure the deviation amount [C] between punch holes [a] and [b]. Target: D = $0 \pm 1.0 \mathrm{~mm}$
4. If the deviation between the punch holes [a] and [b] is [CA], the punch holes deviate upward in the figure relative to the paper folding line [F] (center in the paper feeding direction). Ex.1: Punch hole deviation amount $[D A]=$ Measured value $[C A] 3 \mathrm{~mm} \div 2=$ -1.5 mm (hole positions deviate upward)
5. If the deviation between the punch holes [a] and [b] is [CB], the punch holes deviate downward in the figure relative to the paper folding line $[F]$ (center in the paper feeding direction).
Ex.2: Punch hole deviation amount $[\mathrm{DB}]=$ Measured value $[\mathrm{CB}] 3 \mathrm{~mm} \div 2=$ +1.5 mm (hole positions deviate downward)
6. Complete the adjustment, if the deviation amount [D] between punch holes [a] and [b] falls within the target ( $\pm 1.0 \mathrm{~mm}$ or less).
Ex.3: Punch hole deviation amount [D] = Measured value [C] 0mm $\div 2=0$ (punch hole deviation amount falls within the target)
7. In case the figure exceeds the above mentioned target, follow the procedures shown below.
8. Open the upper cover [1].

9. Loosen two screws [1].
10. Using the triangle marks [1] on the plate as a guide, move the punch unit [2] back and forth to adjust its position.

## 24. MECHANICAL ADJUSTMENT PK-523

### 24.1 Punch section

### 24.1.1 Punch hole deviation correction

## (1) Purpose

This adjustment must be made in the following case

- The punch holes are on a slanted line.
(2) Procedure

2. Turn ON the Main power switch of the machine, and make sample copies for both the single-side and double-side with any tray in Punch mode.
3. Fold the output paper in half and check whether the punch holes are aligned. If the punch holes are misaligned, make the following adjustment.
4. Remove three screws [1], and remove the punch kit cover [2].

5. Loosen four screws [1] and move the punch kit to the left or right by the amount that needs to be corrected referring to the mark [2].

- Wider at the rear [3]: Move the punch kit to the left.
- Wider at the front [4]: Move the punch kit to the right.

6. Make copies in punch mode again and check that punch holes are not on the slanted line.

## 25. MECHANICAL ADJUSTMENT FS-534SD

### 25.1 Paper exit section

### 25.1.1 Half-fold skew adjustment

## (1) Purpose

This adjustment must be made in the following case:

- Fold line goes off the tolerance in the half-fold mode.
- When reinstalling the guide plate assy, perform mechanical adjustment.
(2) Procedure

1. Make a copy in the half-fold mode.
2. Unfold the paper that exits the machine and lay the paper with the ridge facing up.
[A1]

[A2]
3. Open the front door of the finisher.
4. Pull the saddle unit.

5. Confirm the skew of the fold line [1] of the output copy sample (Widths of A1 and A2)
Target: $\mathrm{A} 1-\mathrm{A} 2= \pm 1.0 \mathrm{~mm}$
6. In case the figure exceeds the above mentioned target, follow the adjustment procedures below.
7. Loosen two screws [1].
8. Slide the lever unit [1] upward.
9. Loosen two screws [2].
10. Incline the guide plate assy [1] forward or backward according to the deviation of the crease

In case the cease [1] skews as the right side:

- In case the cease [1] skews as the right side: Incline the guide plate assy backward.

In case the cease [1] skews as the left side:

- In case the cease [1] skews as the left side: Incline the guide plate assy forward.

11. Make the copy sample again to confirm the cease skew.
12. Reinstall the above parts following the removal steps in reverse.

## 26. MECHANICAL ADJUSTMENT FD-536SD saddle section

### 26.1 Paper exit section

### 26.1.1 Half-fold skew adjustment

## (1) Purpose

This adjustment must be made in the following case:

- Fold line goes off the tolerance in the half-fold mode.
- When reinstalling the guide plate assy, perform mechanical adjustment.
(2) Procedure

1. Make a copy in the half-fold mode.
2. Unfold the paper that exits the machine and lay the paper with the ridge facing up.
[A1]

[A2]
3. Open the front door of the finisher.
4. Pull the saddle unit.

5. Confirm the skew of the fold line [1] of the output copy sample (Widths of A1 and A2)
Target: $\mathrm{A} 1-\mathrm{A} 2= \pm 1.0 \mathrm{~mm}$
6. In case the figure exceeds the above mentioned target, follow the adjustment procedures below.
7. Loosen two screws [1].
8. Slide the lever unit [1] upward.
9. Loosen two screws [2].
10. Incline the guide plate assy [1] forward or backward according to the deviation of the crease.

In case the cease [1] skews as the right side:

- In case the cease [1] skews as the right side: Incline the guide plate assy backward.
- In case the cease [1] skews as the left side: Incline the guide plate assy forward.

11. Make the copy sample again to confirm the cease skew.
12. Reinstall the above parts following the removal steps in reverse.

## 27. MECHANICAL ADJUSTMENT FS-537SD saddle section

### 27.1 Paper exit section

### 27.1.1 Half-fold skew adjustment

## (1) Purpose

This adjustment must be made in the following case:

- Fold line goes off the tolerance in the half-fold mode.
- When reinstalling the guide plate assy, perform mechanical adjustment.
(2) Procedure

1. Make a copy in the half-fold mode.
2. Unfold the paper that exits the machine and lay the paper with the ridge facing up.
[A1]

[A2]
3. Open the front door of the finisher.
4. Pull the saddle unit.

5. Confirm the skew of the fold line [1] of the output copy sample (Widths of A1 and A2)
Target: $\mathrm{A} 1-\mathrm{A} 2= \pm 1.0 \mathrm{~mm}$
6. In case the figure exceeds the above mentioned target, follow the adjustment procedures below.
7. Loosen two screws [1].
8. Slide the lever unit [1] upward.
9. Loosen two screws [2].
10. Incline the guide plate assy [1] forward or backward according to the deviation of the crease.

In case the cease [1] skews as the right side:

- In case the cease [1] skews as the right side: Incline the guide plate assy backward.
- In case the cease [1] skews as the left side: Incline the guide plate assy forward.

11. Make the copy sample again to confirm the cease skew.
12. Reinstall the above parts following the removal steps in reverse.

## J REWRITING OF FIRMWARE

## 1. REWRITING OF FIRMWARE

- There are two ways to update the firmware: One is by directly connecting with the main body using the USB memory device, and the other is by downloading over a network.
NOTE 1
" The settings in the "Utility" mode and the "Service Mode" will not be changed, when the firmware is updated.
- Install the various data such as voice data, or loadable device driver as required in the order shown below in accordance with the rewriting firmware or user's environment.

1. Install the various data.
[Service Mode] -> [System 2] -> [Install Data]
2. Install the loadable device driver.
[Service Mode] -> [System 2] -> [Driver Install]
3. Turn OFF and ON the main power switch.

## 2. Confirming the firmware version

### 2.1 Procedure

1. Call the Service Mode to the screen.
2. Select the [Firmware Version].
3. Check the firmware version.

NOTE

- After conducting firmware updating, check the firmware version No. and confirm that the firmware has been normally updated.

## 3. USB memory

### 3.1 Preparation

### 3.1.1 System preparation

## - PC with USB ports

- USB memory
- USB flash memory compatible with the USB (1.1/2.0/3.0) interface. The speed is limited to USB2.0 specifications even if using a device that supports USB3.0.
- The USB memory is formatted in FAT32 format.
- No security functions such as encryption and password lock have been added (or the USB memory allows its security functions to be turned OFF).
- A USB memory that is recognized by the computer as two or more drives cannot be used.
- We recommend that you use a memory device with no more than 32 GB of capacity.

## NOTE

- Possible to be non-operational products.

### 3.1.2 USB memory used to update firmware

1. Uncompress the firmware file.
2. Connect a USB memory to a PC.
3. Copy the rewriting data folder contained in the extracted data to the root directory of the USB memory.

| Product name | Rewriting data folder name |
| :--- | :--- |
| bizhub C368/C308/C258 | FW0002 |
| bizhub C658/C558/C458 | FW0005 |

## NOTE

- More than one firmware data with a single model can be stored in the USB memory.
- In this case, copy the firmware data to the USB memory according to the following procedures.

1. Make the folder named "FWSelect" (case-sensitive) to the root directory of the USB memory.
2. Make a folder with any folder name (one byte alphameric characters, maximum 40 characters) in "FWSelect" folder, and store the firmware data to the folder.

### 3.1.3 Directory configuration of USB memory

Folder2

## Folder3

| $[1]$ | USB memory | [2] | Rewriting data folder (Required)*1 |
| :--- | :--- | :--- | :--- |
| $[3]$ | Storage folder for a plurality of data (Folder name: FW <br> select (Fixed)) *2 | [4] | Storage folder for firmware data B (Folder name: <br> Arbitrary) *2 |
| $[5]$ | Storage folder for firmware data C (Folder name: <br> Arbitrary) *2 | [6] | Storage folder for firmware data D (Folder name: <br> Arbitrary) *2 |

- *1: Required to start the firmware update screen
- *2: Required only when a plurality of data is stored

### 3.2 Procedure

1. Turn OFF the main power switch.
2. Connect the USB memory containing the firmware into the USB port on the right side of the control panel. NOTE

- USB memory must be connected with the main power switch off.

3. Turn the main power switch ON while pressing the Stop key.

NOTE

- When [Administrator Settings] -> [Security Settings] -> [USB Connection Permission setting] -> [External Memory (Service)] > [FW Update] is set to "Restrict", a message "It is limited by the administrator." will appear, and update of the firmware cannot be executed.
- When [Administrator Settings] -> [Security Settings] -> [FW Update (USB) Perm. Sett.] is set to "Password Priority", it requires to input a password after confirming with the administrator.

4. Firmware Update selection screen is displayed.

NOTE

- Unless one of the keys on the control panel is pressed, firmware is automatically updated after 30 seconds when the main power switch is turned on.
- Selectable items displayed change depending on equipped options, etc.

5. Select the firmware data to be updated in the Firmware Update selection screen. If multiple pages is displayed in the selection screen, check all of the pages.
NOTE

- When a plurality of firmware is stored in a USB memory, touch [FW Data Select] to select firmware. In the data selection screen, * is added to the firmware data name in "FW00**" folder contained in the USB memory.

6. Touch [Language Select].
7. On the Language Select screen, select a language to be displayed on the LCD area of the control panel, then touch [Fix]. NOTE

- The language selected on this screen is displayed on the "Language Selection" screen of Utility.
- Up to 9 languages are selectable. However, Japanese and English are essential options.

8. Touch $[\mathrm{OK}]$ to go back to the firmware update selection screen.
9. Press the [START]. (At this time, the Start key starts blinking red.)

NOTE

- The progress ratio of each board is displayed in writing the program.

10. Check that the control panel shows the message indicating that the data has been rewritten correctly ([Downloading Completed]). (The Start key lights blue.)
NOTE

- Check all pages, and make sure that no item is under firmware updating (Downloading...).

11. Turn OFF the main power switch.
12. Remove the USB memory.
13. Turn ON the main power switch.
14. Call the Service Mode to the screen.
15. Select the [Firmware Version].
16. Make sure if the version of firmware is updated.

### 3.3 Action when data transfer fails

- If "NG" appears on the control panel, indicating that rewriting has been unsuccessful (in which case the Start key lights up red), take the following steps

1. Perform the data rewriting procedure again.
2. If the procedure is abnormally terminated, change the USB memory for a new one and try another rewriting sequence.
3. If the procedure is still abnormally terminated, change the board that has caused "NG" and carry out data rewriting procedure.

| F/W to be updated | Appropriate board | Remark |
| :--- | :--- | :--- |
| MFP CONTROLLER | eMMC board (eMMC) | - |
| SCANNER/PRINTER | MFP board (MFPB) |  |
| DSC1 | DSC board/1 (DSCB/1) | Only when SC-508 is mounted |
| DSC2 | DSC board/2 (DSCB/2) | Only when SC-508 is mounted |
| ADF (DF-M) | DF control board (DFCB) | Only when the DF is mounted |
| FINISHER | FS control board (FSCB) | Only when FS-533, FS-534/534SD, FS-536/536SD, or <br> FS-537/FS-537SD is mounted |
| SD |  | Only when FS-534SD, FS-536SD, or FS-537SD is <br> mounted |
| PK | Punch control board (PKCB) | Only when PC-523 is mounted |
| PI | Pl drive board (PIDB) | Only when PI-507 is mounted |
| FAX BOARD CONTROLLER1 | Fax board/1 (FAX/1) | Only when FK-514 is mounted |
| FAX BOARD CONTROLLER2 | Fax board/2 (FAX/2) | Only when FK-514 is mounted |
| FAX BOARD CONTROLLER3 | Fax board/3 (FAX/3) | Only when FK-515 is mounted |
| FAX BOARD CONTROLLER4 | Fax board/4 (FAX/4) | Only when FK-515 is mounted |

## 4. Internet ISW

### 4.1 Outline

- The "Internet ISW" is a system used by the main unit to retrieve firmware from a program server on the Internet and update the firmware.
- This executes when the command is received from the operation panel or CS Remote Care, or at a previously specified timing.

### 4.2 Service environment

- The following conditions are necessary for using the Internet ISW function.
- The main body is connected to such a network environment that the firmware can be downloaded on the internet using the ftp or http protocol.
- The "Internet ISW" will not operate under the following conditions.
- Main power switch is set to OFF.
- Sub power auto power off mode enabled
- When [Administrator Settings] -> [Security Settings] -> [Enhanced Security Mode] is set to "ON".
- Machine is operating, or there are jobs present (including appointed jobs).
- Machine is in idle with suspended job.
- Paper jam has occurred.
- Image file is in the memory.
- Model or the circuit board of the program does not match.

### 4.3 Preparations for firmware rewriting

### 4.3.1 Internet ISW Set

1. Call the Service Mode to the screen.
2. Touch [Machine Update Setting] -> [Internet ISW] -> [Internet ISW Set].

3. Select [ON] in [Function Setting], and touch [END].

NOTE

- Settings such as server setting, etc. will be available by selecting "ON" on this setting.
" When [Administrator Settings] -> [Security Settings] -> [Enhanced Security Mode] is set to "ON", "ON" cannot be selected on this setting.
- To allow the administrator to rewrite firmware, press [Open Mode Settings] and select [Set].

### 4.3.2 Protocol setting

- It performs the setting concerning the protocol (http or ftp) for connecting to the Internet ISW.
(1) Connecting by http

1. Select [Service Mode] -> [Machine Update Setting] -> [Internet ISW].
2. Data input setting

- Touch [HTTP Setting], and select [ON].

3. Connection Time-Out

- Select [Connection Time-Out], and set the time for the connection time out between 30 and 300 seconds.

## NOTE

- To connect MFP to the Internet via a proxy, the proxy server related settings must be configured in addition to [Forwarding Access Setting]. The settings of the proxy used in Internet ISW communications is configured in [Administrator Settings] -> [Network Settings] -> [Machine Update Settings] -> [HTTP Proxy Settings].

## (2) Connecting by ftp

1. Select [Service Mode] -> [Machine Update Setting] -> [Internet ISW].
2. Data input setting - Touch [FTP Setting], and select [ON].
3. Connection Setting

- Perform the setting for accessing FTP server.

1. Select [Port Number], and set the port number for FTP server from 1 through 65535.
2. Select [Connection Time Out], and set the time for the connection time out from 1 through 60.
3. When connecting in PASV mode, select [PASV Mode], and select [ON].

NOTE
-PASV Mode:
This mode is for transferring the file with FTP under the condition where communication is restricted such as inside the firewall. Since with PASV mode, the client with restriction sets the port number, data transmission port can be secured to enable the file transmission.
NOTE

- To connect MFP to the Internet via a proxy, the proxy server related settings must be configured in addition to [Forwarding Access Setting]. The settings of the proxy used in Internet ISW communications is configured in [Administrator Settings] -> [Network Settings] -> [Machine Update Settings] -> [Internet ISW Settings] -> [FTP Server Settings].

### 4.3.3 Forwarding Access Setting

- To make the access setting for the program server which stores the firmware data.

1. Select [Service Mode] -> [Machine Update Setting] -> [Internet ISW].
2. Touch [Forwarding Access Setting].

3. Select [User ID], and enter the user ID which is necessary for connecting to the program server, and touch [END].
4. Select [Password], and enter the password which is necessary for connecting to the program server, and touch [END].
5. Select [URL], and enter the program server address and the directory which stores the firmware by URL method, and touch [END]. NOTE

- Enter the URL which matches to the protocol to be used. For details of the URL, refer to J Table: URL.

6. Select [File Name], and enter the file name of the firmware data to be downloaded, and touch [END].
7. Touch $[\mathrm{OK}]$ to finish setting.

Table: URL

| When connecting to http | http://(host name or IP address)/directory name or https://(host name or IP address)/directory name |
| :--- | :--- |
| When connecting to ftp | $\mathrm{ftp}: / /($ host name or IP address)/directory name |

### 4.3.4 Update Start Time Settings

- Configure settings on the timing to update firmware

1. Select [Service Mode] -> [Machine Update Setting] -> [Internet ISW].
2. Press [Update Time Settings].
3. Select either [Do] or [Cancel].
4. If $[\mathrm{Do}]$ is selected, enter the time to update firmware on the ten-key.
5. Touch [OK].

### 4.4 Making the firmware data

### 4.4.1 Outline

- It is necessary to convert the firmware data and save it in the target directory of the Internet ISW server for upgrading the firmware via Internet ISW.

### 4.4.2 Procedure

1. Uncompress the firmware file.
2. Drag and drop the folder " $\mathrm{FW}^{* * * * " ~[2] ~ c o n t a i n i n g ~ t h e ~ f i r m w a r e ~ i n ~ t h e ~ u n c o m p r e s s e d ~ f o l d e r ~[1] ~ o n t o ~ " m k t a r \_X X . b a t " ~[3] ~ i n ~ t h e ~ s a m e ~ f o l d e r . ~}$ NOTE

- For the folder name [2] and file name [3], refer to Table : Folder name, File name.
[1]
[2]

3. Windows command prompt runs and file generation starts.
4. The command prompt closes automatically when the processing completes.
5. "XXfw.tar" file is created in the same directory.

NOTE

- For file name, refer to Table : Folder name, File name.

6. Copy the "XXfw.tar" file to the predetermined directory of the Internet ISW program server.

Table : Folder name, File name

| Product name | Firmware data folder name | File name (.bat) | File name (.tar) |
| :--- | :--- | :--- | :--- |
| bizhub C368/C308/C258 | FW0002 | mktar_A7PU.bat | A7PUfw.tar |
| bizhub C658/C558/C458 | FW0005 | mktar_A79J.bat | A79Jfw.tar |

### 4.5 Firmware rewriting from the control panel

### 4.5.1 Firmware rewriting from the control panel

NOTE

- When performing the Internet ISW, ask the administrator for permission beforehand.
- DO NOT turn OFF the main power switch while downloading
- When IP address of MFP is assigned by DHCP, the firmware rewriting will be failed by using [Download/Update] button. Use [Download] button in such case.
- The Static IP address of MFP is necessary to execute the firmware rewriting by CS Remote Care or PageScope Enterprise Suite remotely.
- Updates cannot be performed via the [Download/Update] button when connected over Wi-Fi. Use the [Download] button in such cases.
(1) Conducting commands from the control panel

1. Touch [Service Mode] -> [Machine Update Setting] -> [Internet ISW] -> [Download].
2. To download and update firmware data, select [Download/Update]. To only download firmware data and update it later, select [Download].
3. Touch [Start].

4. Main body accesses the server and starts downloading the firmware data.
5. To download and update firmware data, select the types of firmware data to be written and replaced with a newer version in the Firmware Update screen and press [START].

## NOTE

- Unless one of the keys on the control panel is pressed, firmware is updated after 30 seconds when the unit has restarted.
- The display item varies by the configuration of optional parts installed on this machine.
- If multiple pages is displayed in the selection screen, check all of the pages.

(2) During firmware updating

1. After pressing [Start], the main unit connects to the server and starts the download.
2. The message to indicate the status will be displayed on the screen while connecting or transferring data.
(3) Completed or failed
(a) Firmware updated normally
3. When the Firmware is normally updated, restart the main body in auto or manual mode to display the outcome, and touch [OK] to return to the main screen.
(b) Failing to update the firmware due to the network trouble
4. When updating failed to complete due to the trouble on connecting to the network, an error code and the message will be displayed.
5. Restart the main body in auto or manual mode, and touch [OK]. It can be used with the firmware version before conducting updating.
6. Check the settings for the network by error codes, and try updating again.
(c) Failure to update firmware after starting the update process
7. Once firmware updating has started, the ROM in the main body will be deleted. When it failed right after updating has started, restart the main body, and shift to the standby screen to retry downloading.
8. When updating on the control panel, touch [settings] on the standby screen, and check the Network settings again. Touch [Download], and restart the Internet ISW.
NOTE

- Return to the standby screen without fail after turning the main power switch OFF/ON if the firmware is not updated.
- Firmware can be updated with the USB memory.

### 4.6 Firmware rewriting from the CS Remote Care

- For detailed error information relating to CS Remote Care, refer to "CS Remote Care (Outline)"
- For the firmware update procedure using CS Remote Care, refer to CS Remote Care Center Manual.

5. Auto Update setting

### 5.1 Firmware rewriting by the Auto Update function

- The main body access the program server periodically through the network to obtain a new firmware, then rewrites it automatically.

6. Distribution Server Function (Relay server)

### 6.1 Firmware rewriting by the Relay server function

- "Relay Server" is the function, which shares the firmware files (relay data) obtained from the network with the other MFP, and works as the program server of the firmware "Auto Update" function.
NOTE
- This function is disabled when the Marketing Area of the service mode is set to US or Others5.

## 7. How to install the i-Option data

### 7.1 Available function for i-Option

| i-Option | Functions | Data location | How to recover when replacing or formatting HDD |
| :--- | :--- | :--- | :--- |
| LK-102 v3 | PDF processing | In the Standard firmware | [Service Mode] -> [System 2] -> [Install Data] |
| LK-104 v3 | Voice guidance | In the Standard firmware |  |
| LK-105 v4 | Searchable PDF | In the Standard firmware |  |
| LK-106 | Barcode font | In the Standard firmware | n/a |
| LK-107 | Unicode font | In the Standard firmware | LK-107/LK-108 font data installation procedure |
| LK-108 | OCR font | In the Standard firmware |  |
| LK-110 v2 | High functional Image Processing | In the Standard firmware | [Service Mode] -> [System 2] -> [Install Data] |
| LK-111 | Enhancing external linkage <br> (supported by ThinPrint) | In the Standard firmware | n/a |
| LK-114 | Ubiquitous Printing | In the Standard firmware |  |
| LK-115 v2 | TPM (Trusted Platform Module) | In the Standard firmware |  |

### 7.2 LK-107/LK-108 font data installation procedure

1. Prepare an USB memory.
2. Copy the font data to the root directory of the USB memory.

- OCR font: download_OCRA-0.pdf
- Unicode font: download_Andale_J-0.pdf, download_Andale_K-0.pdf, download_Andale_S-0.pdf, download_Andale_T-0.pdf

3. Turn ON the main power switch, and connect the USB memory to the USB port on the side of the control panel.
4. The message "Print a document from External Memory" will be displayed on the control panel, and select it.
5. The font data in the USB memory will be displayed, and select these data to print out
6. The message "Document Printing Failed" will be displayed, and touch [OK].
7. Print out a PCL font list, and confirm that the font data are registered as following names.

- LK-107: Andale Mono WT J, Andale Mono WT K, Andale Mono WT S, Andale Mono WT T
- LK-108: OCR-A

## 8. Creating back up files when updating firmware

- Enabling backup makes the firmware that is being updated possible to be backed up on the HDD while performing firmware update.
- This enables you to restore the backed up firmware (rollback) if an error occurs when updating the firmware
- If backup data already exists in the HDD, the old backup data is deleted and new firmware is backed up.
- To roll back the firmware, select [Service Mode] -> [Machine Update Settings] -> [Firmware Rollback].

### 8.1 Procedure

1. The firmware update screen is displayed when updating the firmware.
2. Select [FW Backup] -> [USB FW BACKUP] and [OTHER FW BACKUP] in the firmware update selection screen.

- [USB FW BACKUP]: Select to execute backup when updating the firmware on the USB flash memory.
- [OTHER FW BACKUP]: Select to execute backup when updating the firmware by non-USB Internet ISW or automatic update feature.

3. Update the firmware.

## NOTE

- The update process takes a few more minutes when creating a backup than when not creating a backup.

## K TROUBLESHOOTING

## 1. JAM CODE

### 1.1 JAM display

### 1.1.1 Display procedure

- When the paper jam occurred, the message, the jam clear procedure, the position jam occurred (number lights up), position of the remaining paper (number lights up), and the JAM code are displayed.
- Touch [Display Switch] to switch the screen showing the jam clear procedure or the jam occurring position. Screen showing jam clear procedure

Screen showing the jam occurring position

## NOTE

- JAM code is displayed on the jam warning screen only when [Service Mode] -> [System 2] -> [JAM Code Display Setting] is set to "Display."
- To change the initial display when jam occurred to the screen showing the jam occurring position, set [Utility] -> [User Settings] $>$ [Custom Display Settings] -> [Paper jam release procedure display settings] to "OFF." When [Paper jam release procedure display settings] is set to "OFF," the "screen showing jam clear procedure" cannot be displayed.
- When a tray life-up failure (trouble code) occurred, for the trouble that can be cleared by removing the tray, the following screen is displayed showing users how to remove jammed paper and how to load paper properly. Therefore, for remaining paper jam, the screen will disappear.
Warning of improper tray setting

- A trouble code (C-02XX) will be displayed if the tray lift-up failure cannot be cleared even when action has been taken by following the Guidance.

### 1.1.2 Misfeed display resetting procedure

1. Open the corresponding door, clear the sheet of paper misfed, and close the door.
2. Touch "OK" displayed on the touch panel.

### 1.2 List of the JAM code (bizhub C368/C308/C258)

| JAM code | JAM type |
| :---: | :---: |
| 10-01 | Misfeed at manual bypass feed section |
| 10-02 |  |
| 10-40 |  |
| 11-01 | Misfeed at tray 1 feed section |
| 11-02 |  |
| 11-40 |  |
| 12-01 | Misfeed at tray 2 feed section |
| 12-40 |  |
| 13-01 | Misfeed at tray 3 feed section |
| 13-40 |  |
| 14-01 | Misfeed at tray 4 feed section |
| 14-40 |  |
| 15-01 | Misfeed at external LCT paper feed section |
| 15-40 |  |
| 16-01 | Misfeed at transfer LCT feed/vertical transport section |
| 16-40 |  |
| 17-20 | Misfeed at external LCT transport section |
| 20-01 | Misfeed at vertical transport section |
| 20-02 |  |
| 20-21 |  |
| 20-22 |  |
| 30-03 | Misfeed at 2nd transfer section |
| 32-01 | Misfeed at fusing/paper exit section |
| 32-05 |  |
| 66-01 | Misfeed at DF turnover section <When DF-629 is installed> |
| 66-11 |  |
| 66-21 |  |
| 66-02 | Misfeed at DF paper feed section <When DF-629 or DF-704 is installed> |
| 66-12 |  |
| 66-03 | Misfeed at DF transport section <When DF-629 or DF-704 is installed> |
| 66-13 |  |
| 66-23 |  |
| 66-33 |  |
| 66-04 | Misfeed at DF paper exit section <When DF-629 or DF-704 is installed> |
| 66-14 |  |
| 66-24 | Misfeed at DF paper exit section <When DF-629 is installed> |
| 66-34 |  |
| 66-05 | Misfeed at DF image reading section <When DF-629 or DF-704 is installed> |
| 66-06 |  |
| 66-15 | Misfeed at DF image reading section <When DF-629 is installed> |
| 66-07 | Misfeed at DF paper feed/transport/image reading/turnover/paper exit section <When DF-629 or DF-704 is installed> |
| 72-14 | Misfeed at FS transport section <When FS-534 or FS-534SD is installed> |
| 72-15 | Misfeed at FS transport section <When FS-534 or FS-534SD is installed> |
| 72-16 | Misfeed at FS transport section <When FS-534, FS-534SD, FS-533 or FS-533+PK-519 is installed> |
| 72-17 | Misfeed at FS transport section <When FS-534, FS-534SD or FS-533 is installed> |
| 72-18 | Misfeed at FS transport section <When FS-534 or FS-534SD is installed> |
| 72-19 | Misfeed at FS transport section <When FS-534 or FS-534SD is installed> |
| 72-21 | Misfeed at FS transport section <When FS-534, FS-534SD or FS-533 is installed> |
| 72-22 | Misfeed at FS transport section <When FS-534 or FS-534SD is installed> |
| 72-23 | Misfeed at FS transport section <When FS-534 or FS-534SD is installed> |
| 72-25 | Misfeed at SD paper exit section <When FS-534SD is installed> |
| 72-26 | Misfeed at SD paper exit section <When FS-534SD is installed> |
| 72-43 | Misfeed at PK JAM <When FS-534+PK-520, FS-534SD+PK-520 or FS-533+PK-519 is installed> |
| 72-70 | Misfeed at PK JAM <When FS-533+PK-519 is installed> |
| 72-81 | Misfeed at FS staple section <When FS-533 is installed> |

| JAM code |  |
| :--- | :--- |
| $72-85$ | Misfeed at SD transport section <When FS-534SD is installed> |
| $72-86$ | Misfeed at SD transport section <When FS-534SD is installed> |
| $72-87$ | Misfeed at SD transport section <When FS-534SD is installed> |
| $75-42$ | Misfeed at RU section <When FS-534 or FS-534SD is installed> |
| $75-43$ | Misfeed at RU section <When FS-534 or FS-534SD is installed> |
| $92-01$ |  |
| $92-02$ | Misfeed at duplex pre-registration section |
| $92-40$ | Controller JAM (paper size error) |
| $93-10$ | Controller JAM (controller forced stop command) |
| $99-01$ | Controller JAM (image processing) |
| $99-02$ | Controller JAM (finisher pre-drive is not completed) |
| $99-03$ | Controller JAM (main body not starting a job) |
| $99-04$ | Controller JAM (finisher internal processing error) |
| $99-05$ | Controller JAM (main body not completing a job) |

### 1.3 List of the JAM code (bizhub C658/C558/C458)

| JAM code | JAM type |
| :---: | :---: |
| 10-01 | Misfeed at manual bypass feed section |
| 10-02 |  |
| 10-04 |  |
| 10-40 |  |
| 11-01 | Misfeed at tray 1 feed section |
| 11-02 |  |
| 11-04 |  |
| 11-40 |  |
| 11-44 |  |
| 12-01 | Misfeed at tray 2 feed section |
| 12-40 |  |
| 13-01 | Misfeed at tray 3 feed section |
| 13-40 |  |
| 14-01 | Misfeed at tray 4 feed section |
| 14-40 |  |
| 15-01 | Misfeed at external LCT paper feed section |
| 15-40 |  |
| 16-01 | Misfeed at transfer LCT feed/vertical transport section |
| 16-40 |  |
| 20-01 | Misfeed at vertical transport section |
| 20-02 |  |
| 20-04 |  |
| 20-21 |  |
| 20-22 |  |
| 30-03 | Misfeed at 2nd transfer section |
| 32-01 | Misfeed at fusing/paper exit section |
| 32-05 |  |
| 32-30 |  |
| 66-02 | Misfeed at DF paper feed section |
| 66-12 |  |
| 66-03 | Misfeed at DF transport section |
| 66-13 |  |
| 66-23 |  |
| 66-33 |  |
| 66-04 | Misfeed at DF paper exit section |

| JAM code | JAM type |
| :---: | :---: |
| 66-14 |  |
| 66-05 | Misfeed at DF image reading section |
| 66-06 |  |
| 66-08 | Double feed detection jam |
| 66-54 | DF controller jam |
| 72-11 | Misfeed at FS transport section (When FS-537 or FS-537SD is installed) |
| 72-14 | Misfeed at FS transport section (When FS-536, FS-536SD, FS-537, or FS-537SD is installed) |
| 72-15 | Misfeed at FS transport section (When FS-536, FS-536SD, FS-537, or FS-537SD is installed) |
| 72-16 | Misfeed at FS transport section (When FS-533, FS-533+PK-519, FS-536, FS-536SD, FS-537, or FS-537SD is installed) |
| 72-17 | Misfeed at FS transport section (When FS-533, FS-536, FS-536SD, FS-537, or FS-537SD is installed) |
| 72-18 | Misfeed at FS transport section (When FS-536, FS-536SD, FS-537, or FS-537SD is installed) |
| 72-19 | Misfeed at FS transport section (When FS-536, FS-536SD, FS-537, or FS-537SD is installed) |
| 72-21 | Misfeed at FS transport section (When FS-533, FS-536, FS-536SD, FS-537, or FS-537SD is installed) |
| 72-22 | Misfeed at FS transport section (When FS-536, FS-536SD, FS-537, or FS-537SD is installed) |
| 72-23 | Misfeed at FS transport section (When FS-536, FS-536SD, FS-537, or FS-537SD is installed) |
| 72-25 | Misfeed at SD paper exit section (When FS-536SD or FS-537SD is installed) |
| 72-26 | Misfeed at SD paper exit section (When FS-536SD or FS-537SD is installed) |
| 72-31 | Misfeed at JS exit section (When FS-537+JS-602 or FS-537SD+JS-602 is installed) |
| 72-34 | Misfeed at JS exit section (When FS-537+JS-602 or FS-537SD+JS-602 is installed) |
| 72-35 | Misfeed at PI section (When FS-537+PI-507 or FS-537SD+PI-507 is installed) |
| 72-40 | Misfeed at ZU section (When FS-537+ZU-609 or FS-537SD+ZU-609 is installed) |
| 72-41 | Misfeed at ZU section (When FS-537+ZU-609 or FS-537SD+ZU-609 is installed) |
| 72-43 | Misfeed at PK JAM (When FS-533+PK-519, FS-536+PK-520, FS-536SD+PK-520, FS-537+PK-523, or FS-537SD + PK-523 is installed) |
| 72-49 | Misfeed at PI section (When FS-537+PI-507 or FS-537SD+PI-507 is installed) |
| 72-50 | Misfeed at PI section (When FS-537+PI-507 or FS-537SD+PI-507 is installed) |
| 72-51 | Misfeed at PI section (When FS-537+PI-507 or FS-537SD+PI-507 is installed) |
| 72-70 | Misfeed at PK JAM <When FS-533+PK-519 is installed> |
| 72-81 | Misfeed at FS staple section (When FS-533, FS-536, FS-536SD, FS-537, or FS-537SD is installed) |
| 72-84 | Misfeed at SD staple section (When FS-536SD or FS-537SD is installed) |
| 72-85 | Misfeed at SD transport section (When FS-536SD or FS-537SD is installed) |
| 72-86 | Misfeed at SD transport section (When FS-536SD or FS-537SD is installed) |
| 72-87 | Misfeed at SD transport section (When FS-536SD or FS-537SD is installed) |
| 75-42 | Misfeed at RU section (When FS-536, FS-536SD, FS-537, or FS-537SD is installed) |
| 75-43 | Misfeed at RU section (When FS-536, FS-536SD, FS-537, or FS-537SD is installed) |
| 92-01 | Misfeed at duplex pre-registration section |
| 92-02 |  |
| 92-04 |  |
| 92-40 |  |
| 93-10 | Misfeed at duplex transport section |
| 99-01 | Controller JAM (paper size error) |
| 99-02 | Controller JAM (controller forced stop command) |
| 99-03 | Controller JAM (image processing) |
| 99-04 | Controller JAM (a job reservation in the main body is not released) |
| 99-05 | Controller JAM (main body not starting a job) |
| 99-06 | Controller JAM (print control on the main body is not completed) |
| 99-07 | Controller JAM (main body not completing a job) |
| 99-08 | Controller JAM (finisher not starting a job) |
| 99-09 | Controller JAM (finisher not completing a job) |

### 1.4 JAM that do not display the JAM code

| JAM type | JAM detection timing | Ref. page |
| :--- | :--- | :--- |
| Misfeed at tray 2 feed <br> section | Paper jam of a sheet of paper left at the tray 2 feed section results, if the tray <br> 2 vertical transport sensor (PS19) is turned ON when the main power switch is <br> turned ON, a door is opened and closed, or a misfeed or malfunction is reset. | K.1.8.3 12-01, 12-40 <br> K.1.9.3 12-01, 12-40 |

| JAM type | JAM detection timing | Ref. page |
| :---: | :---: | :---: |
|  | Paper jam of a sheet of paper left at the tray 2 feed section results, if a sheet of paper is determined to exist at a position detected when the main power switch is turned ON, a door is opened and closed, or a misfeed or malfunction is reset. |  |
| Misfeed at tray 3 feed section | Paper jam of a sheet of paper left at the tray 3 feed section results, if the tray 3 vertical transport sensor (PS113) is turned ON when the main power switch is turned ON, a door is opened and closed, or a misfeed or malfunction is reset. | $\begin{array}{ll} \mathrm{K} .1 .8 .4 & 13-01, \\ \mathrm{~K} .13-9.4 & 13-01, \\ 13-40 \end{array}$ |
|  | Paper jam of a sheet of paper left at the tray 3 feed section results, if a sheet of paper is determined to exist at a position detected when the main power switch is turned ON, a door is opened and closed, or a misfeed or malfunction is reset. |  |
| Misfeed at tray 4 feed section | Paper jam of a sheet of paper left at the tray 4 feed section results, if the tray 4 vertical transport sensor (PS123) is turned ON when the main power switch is turned ON , a door is opened and closed, or a misfeed or malfunction is reset. | $\begin{aligned} & \text { K.1.8.5 14-01, } 14-40 \\ & \text { K.1.9.5 14-01, 14-40 } \end{aligned}$ |
|  | Paper jam of a sheet of paper left at the tray 4 feed section results, if a sheet of paper is determined to exist at a position detected when the main power switch is turned ON, a door is opened and closed, or a misfeed or malfunction is reset. |  |
| Misfeed at external LCT paper feed section | Paper jam of a sheet of paper left at the external LCT feed section results, if the LU paper feed sensor (PS3) is turned ON when the main power switch is turned ON, a door is opened and closed, or a misfeed or malfunction is reset. | $\begin{aligned} & \text { K.1.8.6 15-01, } 15-40 \\ & \text { K.1.9.6 15-01, 15-40 } \end{aligned}$ |
|  | Paper jam of a sheet of paper left at the external LCT feed section results, if a sheet of paper is determined to exist at a position detected when the main power switch is turned ON, a door is opened and closed, or a misfeed or malfunction is reset. |  |
| Misfeed at transfer LCT feed/vertical transport section | Paper jam of a sheet of paper left at the transfer LCT transport section results, if the vertical transport sensor (PS133) is turned ON when the main power switch is turned ON, a door is opened and closed, or a misfeed or malfunction is reset. | $\begin{array}{\|l\|l\|} \hline \text { K.1.8.7 16-01, } 16-40 \\ \text { K.1.9.7 16-01, } 16-40 \end{array}$ |
|  | Paper jam of a sheet of paper left at the transfer LCT transport section results, if a sheet of paper is determined to exist at a position detected when the main power switch is turned ON, a door is opened and closed, or a misfeed or malfunction is reset. |  |
| Misfeed at external LCT transport section | Paper jam of a sheet of paper left at the external LCT transport section results, if a sheet of paper is determined to exist at a position detected when the main power switch is turned ON, a door is opened and closed, or a misfeed or malfunction is reset. | K.1.8.8 17-20 |
| Misfeed at vertical transport section | Paper jam of a sheet of paper left at the vertical transport section results, if a sheet of paper is determined to exist at a position detected when the main power switch is turned ON, a door is opened and closed, or a misfeed or malfunction is reset. | $\begin{array}{ll} \hline \text { K.1.10.2 } 20-21 \\ \text { K.1.10.3 20-22 } \\ \text { K.1.11.2 20-21 } \\ \text { K.1.11.3 } 20-22 \end{array}$ |
| Misfeed at 2nd transfer section | Paper jam of a sheet of paper left at the 2nd transfer section results, if the registration sensor (PS1) is turned ON (unblocked) when the main power switch is turned ON, a door is opened and closed, or a misfeed or malfunction is reset. | $\begin{array}{ll} \text { K.1.12.1 } 30-03 \\ \text { K.1.13.1 } 30-03 \end{array}$ |
|  | Paper jam of a sheet of paper left at the 2nd transfer section results, if the registration sensor 2 (PS72) is turned ON (unblocked) when the main power switch is turned ON, a door is opened and closed, or a misfeed or malfunction is reset. (bizhub C658/C558 only) |  |
|  | Paper jam of a sheet of paper left at the 2nd transfer section results, if a sheet of paper is determined to exist at a position detected when the main power switch is turned ON, a door is opened and closed, or a misfeed or malfunction is reset. |  |
| Misfeed at exit section | Paper jam of a sheet of paper left at the exit section results, if the paper exit sensor (PS3) is turned ON (unblocked) when the main power switch is turned ON, a door is opened and closed, or a misfeed or malfunction is reset. | $\begin{aligned} & \text { K.1.12.2 32-01, 32-05 } \\ & \text { K.1.13.2 32-01, 32-05, 32-30 } \end{aligned}$ |
|  | Paper jam of a sheet of paper left at the exit section results, if a sheet of paper is determined to exist at a position detected when the main power switch is turned ON, a door is opened and closed, or a misfeed or malfunction is reset. |  |
| Misfeed at DF paper feed section (bizhub C658/ C558/C458) | Paper jam of a sheet of paper left at the DF paper feed section results, if the after separate sensor (PS4) is turned ON when the main power switch is turned ON, a door is opened and closed, or a misfeed or malfunction is reset. | K.1.15.1 66-02, 66-12 |
| Misfeed at DF transport section (bizhub C658/ C558/C458) | Paper jam of a sheet of paper left at the DF transfer section results, if the registration sensor (PS5) is turned ON when the main power switch is turned ON, a door is opened and closed, or a misfeed or malfunction is reset. | $\begin{aligned} & \text { K.1.15.2 66-03, 66-13, 66-23, } \\ & 66-33 \end{aligned}$ |
| Misfeed at DF paper exit section (bizhub C658/ C558/C458) | Paper jam of a sheet of paper left at the DF exit section results, if the paper exit sensor (PS7) is turned ON (unblocked) when the main power switch is turned ON, a door is opened and closed, or a misfeed or malfunction is reset. | K.1.15.3 66-04, 66-14 |

| JAM type |  | JAM detection timing |
| :--- | :--- | :--- |
| Misfeed at DF image <br> reading section (bizhub <br> C658/C558/C458) | Paper jam of a sheet of paper left at the DF image reading section results, if <br> the before read sensor (PS6) is turned ON (unblocked) when the main power <br> switch is turned ON, a door is opened and closed, or a misfeed or malfunction <br> is reset. | K.1.15.4 66-05, 66-06 |
| Misfeed at PK section <br> residual paper jam (When <br> FS-537+PK-523 or <br> FS-537SD+PK-523 is <br> installed) | Paper jam of a sheet of paper left at the PK section results, when the main <br> power switch is turned ON, and the paper is detected by the paper size detect <br> board (PSDTB). | K.1.17.15 72-43 |
| Misfeed at duplex pre- <br> registration section | Paper jam of a sheet of paper left at the duplex pre-registration section <br> results, if a sheet of paper is determined to exist at a position detected when <br> the main power switch is turned ON, a door is opened and closed, or a <br> misfeed or malfunction is reset. | K.1.19.1 92-01, 92-02, 92-04, <br> $92-40$ <br> K.1.18.1 92-01, 92-02, 92-40 |
| Misfeed at duplex transport <br> section | Paper jam of a sheet of paper left at the duplex transport section results, if the <br> ADU paper passage sensor/1 (PS40) is turned ON (unblocked) or the ADU <br> paper passage sensor/2 (PS41) is turned ON (blocked) when the main power <br> switch is turned ON, a door is opened and closed, or a misfeed or malfunction <br> is reset. | K.1.18.2 93-10 <br> K.1.19.2 93-10 |
|  | Paper jam of a sheet of paper left at the duplex transport section results, if a <br> sheet of paper is determined to exist at a position detected when the main <br> power switch is turned ON, a door is opened and closed, or a misfeed or <br> malfunction is reset. |  |

### 1.5 Sensor layout

### 1.5.1 bizhub C368/C308/C258

| $[1]$ | Paper exit sensor (PS3) | $[2]$ | ADU paper passage sensor/1 (PS40) |

### 1.6 Initial check items

- When a paper misfeed occurs, first perform the following initial check items.

| Check item | Action |
| :--- | :--- |
| Does paper meet product specifications? | Replace paper. <br> Is the paper curled, wavy, or damp?Replace paper. <br> Instruct user on proper paper storage. |
| Is a foreign object present along the paper path, or is the paper path deformed or <br> worn? | Clean the paper path or replace the part on the paper <br> path if necessary. |
| Are rolls or rollers dirty, deformed, or worn? | Clean the defective roll or roller. <br> Replace the defective roll or roller. |
| Are the paper size and the detected paper size by the edge guide are matching? | Adjust the edge guide to match the paper size. |
| Are the actuators operating correctly? | Correct the defective actuator. <br> Replace the defective actuator. |

### 1.7 Jam when thin or thick paper is fed

### 1.7.1 Paper jam for thin paper

If paper jams occur while feeding thin paper $\left(52 \mathrm{~g} / \mathrm{m}^{2}(1313 / 16 \mathrm{lb})\right)$ from the tray 1 or the tray 2 , adjust the paper pick-up pressure of the tray 1 or the tray 2 to apply the pick-up pressure for thin paper to the tray. However, if the pick-up pressure is changed to the one for thin paper, jam may occur especially when thick paper is used.
bizhub C368/C308/C258: I.11.2.2 Pick-up pressure adjustment of the tray $1 / 2$
bizhub C658/C558/C458: I.12.2.2 Pick-up pressure adjustment of the tray $1 / 2$

### 1.7.2 Paper jam for thick paper

If paper jams occur while feeding thick paper from the manual bypass, adjust the separator roller pressure of the manual bypass to apply the separator roller pressure for thick paper to the tray. However, if the separator roller pressure is changed to the one for thick paper, jam may occur especially when thin paper is used.
bizhub C368/C308/C258: I.11.2.3 Separator roller pressure adjustment of the bypass tray
bizhub C658/C558/C458: I.12.2.3 Separator roller pressure adjustment of the bypass tray

### 1.8 1\#-\#\# (bizhub C368/C308/C258)

### 1.8.1 10-01, 10-02, 10-40

(1) Contents

| JAM type | Misfeed at manual bypass feed section |  |
| :--- | :---: | :--- |
| JAM code | $10-01,10-02,10-40$ |  |
| JAM detection timing | $10-01$ | The leading edge of the paper is not turned ON (unblocked) the registration sensor (PS1) even <br> after the lapse of a given period of time after the manual bypass tray starts to feed paper. |
|  |  |  |

|  | 10-02 | For paper fed from the manual bypass tray, loop forming has not been complete before a sheet enters the registration roller because the rise timing of load to perform registration is earlier than the rise timing of load to form a loop. |
| :---: | :---: | :---: |
|  | 10-40 | For paper fed from the manual bypass tray, the image write start signal permit continues to be disabled for a predetermined period of time after the timing of the image write start signal output. |
| Misfeed processing location | Right door |  |
| Relevant parts | - Transport motor (M1) <br> - Registration clutch (CL4) <br> - Bypass paper feed clutch (CL7) <br> - Bypass pick-up solenoid (SD1) <br> - Registration sensor (PS1) <br> - Front side board (FRB) <br> - MFP board (MFPB) |  |

(2) Procedure

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | PS1 I/O check, sensor check | FRB CN8-3 (ON) | $6-\mathrm{L}$ |
| 3 | CL4 operation check | FRB CN8-7 (CL4_24V) | $5-\mathrm{L}$ |
| 4 | CL7 operation check | MFPB CN18E-8 (ON) | $22-\mathrm{J}$ |
| 5 | SD1 operation check | MFPB CN18E-10 (ON) | $22-J$ |
| 6 | M1 operation check | MFPB CN8E-3 (REM) | 2-C |
| 7 | MFPB CN8E-6 (LOCK) |  |  |
| 8 | Replace FRB. | - | - |
| 9 | Replace MFPB. | - | - |

### 1.14.1 66-01, 66-11, 66-21

(1) Contents

| JAM type | Misfeed at DF turnover section |  |  |
| :---: | :---: | :---: | :---: |
| JAM code | 66-01, 66-11, 66-21 |  |  |
| JAM detection timing | 66-01 | <When DF-629 is installed> | The document registration sensor (PS3) is not turned ON (unblocked) by the paper even after the set period of time has elapsed after the reverse registration operation started. |
|  | 66-11 | <When DF-629 is installed> | The document registration sensor (PS3) is not turned OFF (blocked) after the set period of time after PS3 is turned ON (unblocked) after the switchback registration started. |
|  | 66-21 | <When DF-629 is installed> | The document reading sensor (PS4) is not turned ON after a lapse of a given time after the document registration sensor (PS3) is turned ON (unblocked). |
| Misfeed processing location | - Left cover <br> - Re-feeding opening |  |  |
| Relevant parts | - Document reading motor (M1) <br> - Registration motor (M3) <br> - Document registration sensor (PS3) <br> - Document reading sensor (PS4) <br> - DF control board (DFCB) |  |  |

## (2) Procedure

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | PS4 I/O check, sensor check | DFCB J10-3 (ON) | DF-629 2-G |
| 3 | PS3 I/O check, sensor check | DFCB J14-12 (ON) | DF-629 5-G |
| 4 | M1 operation check | DFCB J7-1 to 4 | DF-629 2-B |
| 5 | M3 operation check | DFCB J6-1 to 4 | DF-629 3-B |
| 6 | Replace DFCB. | - | - |

1.14.2 66-02, 66-12
(1) Contents

| JAM type | Misfeed at DF paper feed section |  |  |
| :---: | :---: | :---: | :---: |
| JAM code | 66-02, 66-12 |  |  |
| JAM detection timing | 66-02 | <When DF-629 or DF-704 is installed> | The after separate sensor (PS2) is not turned ON (blocked) after a lapse of a given time after the document feed motor (M2) is turned ON. |
|  | 66-12 | <When DF-629 or DF-704 is installed> | The size of the original on the tray detected by DF does not match the size of the original detected by the main body. |
| Misfeed processing location | Left cover |  |  |
| Relevant parts | <When DF-629 is installed> |  | - Document feed motor (M2) <br> - After separate sensor (PS2) <br> - Document length size sensor/1 (PS6) <br> - Document length size sensor/2 (PS7) <br> - Document width size sensor (VR1) <br> - DF control board (DFCB) |
|  | <When DF-704 is installed> |  | - Document feed motor (M2) <br> - After separate sensor (PS2) <br> - Document length sensor/1 (PS8) <br> - Document length sensor/2 (PS9) <br> - Document width sensor (VR1) <br> - DF control board (DFCB) |

## (2) Procedure

(a) When DF-629 is installed

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | PS2 I/O check, sensor check | DFCB J14-8 (ON) | DF-629 6-G |
| 3 | PS6 I/O check, sensor check | DFCB J12-6 (ON) | DF-629 4-G |
| 4 | PS7 I/O check, sensor check | DFCB J12-5 (ON) | DF-629 4-G |
| 5 | VR1 I/O check, sensor check | DFCB J12-3 (ON) | DF-629 4-G |

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 6 | M2 operation check | DFCB J5-1 to 4 | DF-629 2-B |
| 7 | Replace DFCB. | - | - |

- Link to the wiring diagram ( N.4.1 DF-629)
(b) When DF-704 is installed

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | PS2 I/O check, sensor check | DFCB J14-8 (ON) | DF-704 6-G |
| 3 | PS8 I/O check, sensor check | DFCB J12-6 (ON) | DF-704 3 to 4-G |
| 4 | PS9 I/O check, sensor check | DFCB J12-5 (ON) | DF-704 3-G |
| 5 | VR1 I/O check, sensor check | DFCB J12-3 (ON) | DF-704 4-G |
| 6 | M2 operation check | DFCB J5-1 to 4 | DF-704 1 to 2-B |
| 7 | Replace DFCB. | - | - |

- Link to the wiring diagram ( N.4.2 DF-704)

### 1.14.3 66-03, 66-13, 66-23, 66-33

(1) Contents

| JAM type | Misfeed at DF transport section |  |  |
| :---: | :---: | :---: | :---: |
| JAM code | 66-03, 66-13, 66-23, 66-33 |  |  |
| JAM detection timing | 66-03 | <When DF-629 or DF-704 is installed> | The after separate sensor (PS2) is not turned OFF (unblocked) after a lapse of a given time after PS2 is turned ON (blocked). |
|  | 66-13 | <When DF-629 is installed> | The document registration sensor (PS3) is not turned ON (unblocked) after a lapse of a given time after the after separate sensor (PS2) is turned ON (blocked). |
|  |  | <When DF-704 is installed> | The registration sensor (PS3) is not turned ON (unblocked) after a lapse of a given time after the after separate sensor (PS2) is turned ON (blocked). |
|  | 66-23 | <When DF-629 is installed> | The document registration sensor (PS3) is not turned OFF (blocked) after a lapse of given time after PS3 is turned ON (unblocked). |
|  |  | <When DF-704 is installed> | The registration sensor (PS3) is not turned OFF (blocked) after a lapse of given time after PS3 is turned ON (unblocked). |
|  | 66-33 | <When DF-629 is installed> | The document reading sensor (PS4) is not turned ON after a lapse of a given time after the document registration sensor (PS3) is turned ON (unblocked). |
|  |  | <When DF-704 is installed> | The document reading sensor (PS6) is not turned ON after a lapse of a given time after the registration sensor (PS3) is turned ON (unblocked). |
| Misfeed processing location | Left cover |  |  |
| Relevant parts | <When DF-629 is installed> |  | - Document reading motor (M1) <br> - Document feed motor (M2) <br> - Registration motor (M3) <br> - After separate sensor (PS2) <br> - Document registration sensor (PS3) <br> - Document reading sensor (PS4) <br> - DF control board (DFCB) |
|  | <When DF-704 is installed> |  | - Document reading motor (M1) <br> - Document feed motor (M2) <br> - Registration motor (M3) <br> - After separate sensor (PS2) <br> - Registration sensor (PS3) <br> - Document reading sensor (PS6) <br> - DF control board (DFCB) |

## (2) Procedure

(a) When DF-629 is installed

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | PS2 I/O check, sensor check | DFCB J14-8 (ON) | DF-629 6-G |
| 3 | PS3 I/O check, sensor check | DFCB J14-12 (ON) | DF-629 5-G |
| 4 | PS4 I/O check, sensor check | DFCB J10-3 (ON) | DF-629 2-G |
| 5 | M1 operation check | DFCB J7-1 to 4 | DF-629 2-B |
| 6 | M2 operation check | DFCB J5-1 to 4 | DF-629 2-B |

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 7 | M3 operation check | DFCB J6-1 to 4 | DF-629 3-B |
| 8 | Replace DFCB. | - | - |

- Link to the wiring diagram ( N.4.1 DF-629)
(b) When DF-704 is installed

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | PS2 I/O check, sensor check | DFCB J14-8 (ON) | DF-704 6-G |
| 3 | PS3 I/O check, sensor check | DFCB J14-12 (ON) | DF-704 4-G |
| 4 | PS6 I/O check, sensor check | DFCB J10-3 (ON) | DF-704 2-G |
| 5 | M1 operation check | DFCB J7-1 to 4 | DF-704 1-B |
| 6 | M2 operation check | DFCB J5-1 to 4 | DF-704 1 to 2-B |
| 7 | M3 operation check | DFCB J6-1 to 4 | DF-704 2-B |
| 8 | Replace DFCB. | - | - |

- Link to the wiring diagram ( N.4.2 DF-704)

### 1.14.4 66-04, 66-14, 66-24, 66-34

(1) Contents

| JAM type | Misfeed at DF paper exit section |  |  |
| :---: | :---: | :---: | :---: |
| JAM code | 66-04, 66-14, 66-24, 66-34 |  |  |
| JAM detection timing | 66-04 | <When DF-629 is installed> | The document exit sensor (PS5) is not turned ON (blocked) after a lapse of a given time after the document reading sensor (PS4) is turned ON. |
|  |  | <When DF-704 is installed> | The document exit sensor (PS5) is not turned ON (blocked) after a lapse of a given time after the document reading sensor (PS6) is turned ON. |
|  | 66-14 | <When DF-629 is installed> | The document exit sensor (PS5) is not turned OFF (unblocked) after a lapse of a given time after the document reading sensor (PS4) is turned OFF. |
|  |  | <When DF-704 is installed> | The document exit sensor (PS5) is not turned OFF (unblocked) after a lapse of a given time after the document reading sensor (PS6) is turned OFF. |
|  | 66-24 | <When DF-629 is installed> | The document exit sensor (PS5) is not turned ON (blocked) after a lapse of a given time after the document reading sensor (PS4) is turned ON. |
|  | 66-34 | <When DF-629 is installed> | The document exit sensor (PS5) is not turned OFF (unblocked) after the laps of give time after the document reading sensor (PS4) turned OFF after the switchback exit operation started. |
| Misfeed processing location | - Left cover <br> - Opening and closing guide |  |  |
| Relevant parts | <When DF-629 is installed> |  | - Document reading motor (M1) <br> - Document reading sensor (PS4) <br> - Document exit sensor (PS5) <br> - DF control board (DFCB) |
|  | <When DF-704 is installed> |  | - Document reading motor (M1) <br> - Document exit sensor (PS5) <br> - Document reading sensor (PS6) <br> - DF control board (DFCB) |

## (2) Procedure

(a) When DF-629 is installed

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | PS4 I/O check, sensor check | DFCB J10-3 (ON) | DF-629 2-G |
| 3 | PS5 I/O check, sensor check | DFCB J15-6 (ON) | DF-629 3-G |
| 4 | M1 operation check | DFCB J7-1 to 4 | DF-629 2-B |
| 5 | Replace DFCB. | - | - |

- Link to the wiring diagram ( N.4.1 DF-629)
(b) When DF-704 is installed

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 2 | PS6 I/O check, sensor check | DFCB J10-3 (ON) | DF-704 2-G |
| 3 | PS5 I/O check, sensor check | DFCB J15-6 (ON) | DF-704 3-G |
| 4 | M1 operation check | DFCB J7-1 to 4 | DF-704 1-B |
| 5 | Replace DFCB. | - | - |

- Link to the wiring diagram ( N.4.2 DF-704)

### 1.14.5 66-05, 66-06, 66-15

## (1) Contents

| JAM type | Misfeed at DF image reading section |  |  |
| :---: | :---: | :---: | :---: |
| JAM code | 66-05, 66-06, 66-15 |  |  |
| JAM detection timing | 66-05 | <When DF-629 is installed> | The document reading sensor (PS4) is not turned OFF after a lapse of a given time after the document registration sensor (PS3) is turned OFF (blocked). |
|  |  | <When DF-704 is installed> | The document reading sensor (PS6) is not turned OFF after a lapse of a given time after the registration sensor (PS3) is turned OFF (blocked). |
|  | 66-06 | <When DF-629 is installed> | The document reading sensor (PS4) is turned ON earlier than a given time after PS4 is turned OFF during original transportation. |
|  |  | <When DF-704 is installed> | The document reading sensor (PS6) is turned ON earlier than a given time after PS6 is turned OFF during original transportation. |
|  | 66-15 | <When DF-629 is installed> | The document reading sensor (PS4) does not turn OFF after the laps of given time after the document registration sensor (PS3) is turned OFF (blocked) after the switchback read operation started. |
| Misfeed processing location | Left cover |  |  |
| Relevant parts | <When DF-629 is installed> |  | - Document reading motor (M1) <br> - Reading roll release motor (M5) <br> - Document registration sensor (PS3) <br> - Document reading sensor (PS4) <br> - DF control board (DFCB) |
|  | <When DF-704 is installed> |  | - Document reading motor (M1) <br> - Reading roller release motor (M4) <br> - Registration sensor (PS3) <br> - Document reading sensor (PS6) <br> - DF control board (DFCB) |

## (2) Procedure

(a) When DF-629 is installed

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | Make the adjustment of original stop position. | - | - |
| 3 | PS3 I/O check, sensor check | DFCB J14-12 (ON) | DF-629 5-G |
| 4 | PS4 I/O check, sensor check | DFCB J10-3 (ON) | DF-629 2-G |
| 5 | M1 operation check | DFCB J7-1 to 4 | DF-629 2-B |
| 6 | M5 operation check | DFCB J18-4 to 5 | DF-629 2-G |
| 7 | Replace DFCB. | - | - |

- Link to the wiring diagram ( N.4.1 DF-629)
(b) When DF-704 is installed

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | Make the adjustment of original stop position. | - | - |
| 3 | PS3 I/O check, sensor check | DFCB J14-12 (ON) | DF-704 4-G |
| 4 | PS6 I/O check, sensor check | DFCB J10-3 (ON) | DF-704 2-G |
| 5 | M1 operation check | DFCB J7-1 to 4 | DF-704 1-B |
| 6 | M4 operation check | DFCB J18-4 to 5 | DF-704 1-G |
| 7 | Replace DFCB. | - | - |

- Link to the wiring diagram ( N.4.2 DF-704)

### 1.14.6 66-07

## (1) Contents

| JAM type | Misfeed at DF paper feed/transport/image reading/turnover/paper exit section |  |  |
| :---: | :---: | :---: | :---: |
| JAM code | 66-07 |  |  |
| JAM detection timing | 66-07 | <When DF-629 or DF-704 is installed> | Due to a remaining sheet of paper that has not been detected by sensors, before the start of a job, a sensor detects the sheet at an unexpected timing. |
| Misfeed processing location | Left cover |  |  |
| Relevant parts | <When DF-629 is installed> |  | - Document registration sensor (PS3) <br> - Document reading sensor (PS4) <br> - Document exit sensor (PS5) <br> - DF control board (DFCB) |
|  | <When DF | 04 is installed> | - Registration sensor (PS3) <br> - Document exit sensor (PS5) <br> - Document reading sensor (PS6) <br> - DF control board (DFCB) |

## (2) Procedure

(a) When DF-629 is installed

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | Make the adjustment of original stop position. | - | - |
| 3 | PS3 I/O check, sensor check | DFCB J14-12 (ON) | DF-629 5-G |
| 4 | PS4 I/O check, sensor check | DFCB J10-3 (ON) | DF-629 2-G |
| 5 | PS5 I/O check, sensor check | DFCB J15-6 (ON) | DF-629 3-G |
| 6 | Replace DFCB. | - | - |

- Link to the wiring diagram ( N.4.1 DF-629)
(b) When DF-704 is installed

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | Make the adjustment of original stop position. | - | - |
| 3 | PS3 I/O check, sensor check | DFCB J14-12 (ON) | DF-704 4-G |
| 4 | PS5 I/O check, sensor check | DFCB J15-6 (ON) | DF-704 3-G |
| 5 | PS6 I/O check, sensor check | DFCB J10-3 (ON) | DF-704 2-G |
| 6 | Replace DFCB. | - | - |

- Link to the wiring diagram ( N.4.2 DF-704)

### 1.15 6\#-\#\# (bizhub C658/C558/C458)

### 1.15.1 66-02, 66-12

(1) Contents

| JAM type | Misfeed at DF paper feed section |  |
| :---: | :---: | :---: |
| JAM code | 66-02, 66-12 |  |
| JAM detection timing | 66-02 | The after separate sensor (PS4) is not turned ON after a lapse of a given time after the take-up motor (M1) is turned ON. |
|  | 66-12 | A StreetPass communication occurs between the DF and the controller. |
|  | - | Paper jam of a sheet of paper left at the DF paper feed section results, if the after separate sensor (PS4) is turned ON when the main power switch is turned ON, a door is opened and closed, or a misfeed or malfunction is reset. |
| Misfeed processing location | - Transportation cover <br> - Opening and closing guide |  |
| Relevant parts | - Take-up motor (M1) <br> - After separate sensor (PS4) <br> - DF control board (DFCB) <br> - MFP board (MFPB) |  |

(2) Procedure

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | PS4 I/O check, sensor check | DFCB CN6-5 (ON) | DF 7-J |
| 3 | M1 operation check | DFCB CN3-1 to 4 | PKCB 12-C |

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 4 | DFCB ICP2 or ICP10 conduction check. | - | - |
| 5 | Replace DFCB. | - | - |
| 6 | Replace MFPB. | - | - |

- Link to the wiring diagram ( N. 3 Dual scan document feeder)

### 1.15.2 66-03, 66-13, 66-23, 66-33

## (1) Contents

| JAM type | Misfeed at DF transport section |  |
| :---: | :---: | :---: |
| JAM code | 66-03, 66-13, 66-23, 66-33 |  |
| JAM detection timing | 66-03 | The after separate after it is turned ON |
|  | 66-13 | The registration sen the paper has turne |
|  | 66-23 | The registration sen the paper has turne |
|  | 66-33 | The before read sen and the registration |
|  | - | Paper jam of a shee (PS5) is turned ON misfeed or malfunct |
| Misfeed processing location | - Transportation cover <br> - Opening and closing guide |  |
| Relevant parts | - Regis <br> - Take <br> - Regis <br> - After <br> - Befor <br> - DF co | tion motor (M2) motor (M1) tion sensor (PS5) parate sensor (PS4) ead sensor (PS6) ol board (DFCB) |

## (2) Procedure

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | PS5 I/O check, sensor check | DFCB CN6-17 (ON) | DF 9-J |
| 3 | PS4 I/O check, sensor check | DFCB CN6-5 (ON) | DF 11-C |
| 4 | PS6 I/O check, sensor check | DFCB CN11-2 (ON) | DF 1-C |
| 5 | M1 operation check | DFCB CN3-1 to 4 | DF 12-C |
| 6 | M2 operation check | DFCB CN3-5 to 8 | DF 11-C |
| 7 | DFCB ICP3 or ICP15 conduction check. | - | - |
| 8 | Replace DFCB. | - | - |

- Link to the wiring diagram ( N. 3 Dual scan document feeder)

### 1.15.3 66-04, 66-14

(1) Contents

| JAM type | Misfeed at DF paper exit section |  |
| :---: | :---: | :---: |
| JAM code | 66-04, 66-14 |  |
| JAM detection timing | 66-04 | The paper exit sensor (PS7) is not turned ON (unblocked) even after the set period of time has elapsed after the before read sensor (PS6) is turned ON by the paper. |
|  | 66-14 | The paper exit sensor (PS7) is not turned OFF even after the lapse of a given period of time after the paper has turned OFF the before read sensor (PS6). |
|  | - | Paper jam of a sheet of paper left at the DF exit section results, if the paper exit sensor (PS7) is turned ON (unblocked) when the main power switch is turned ON, a door is opened and closed, or a misfeed or malfunction is reset. |
| Misfeed processing location | - Transportation cover <br> - Opening and closing guide |  |
| Relevant parts | - Paper feed motor (M4) <br> - Before read sensor (PS6) <br> - Paper exit sensor (PS7) <br> - DF control board (DFCB) |  |

## (2) Procedure

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 2 | PS6 I/O check, sensor check | DFCB CN11-3 (ON) | DF 1-C |
| 3 | PS7 I/O check, sensor check | DFCB CN13-3 (ON) | DF 7-C |
| 4 | M4 operation check | DFCB CN15-1 to 4 | DF 11-C |
| 5 | DFCB ICP8 conduction check. | - | - |
| 6 | Replace DFCB. | - | - |

- Link to the wiring diagram ( N. 3 Dual scan document feeder)

### 1.15.4 66-05, 66-06

## (1) Contents

| JAM type | Misfeed at DF image reading section |  |
| :---: | :---: | :---: |
| JAM code | 66-05, 66-06 |  |
| JAM detection timing | 66-05 | The after separate sensor (PS6) is not turned OFF even after the lapse of a given period of time after the paper has turned OFF the registration sensor (PS6). |
|  | 66-06 | The before read sensor (PS6) is turned ON earlier than a given period of time after the paper has turned OFF the before read sensor (PS6) during original transportation. |
|  | - | Paper jam of a sheet of paper left at the DF image reading section results, if the before read sensor (PS6) is turned ON (unblocked) when the main power switch is turned ON, a door is opened and closed, or a misfeed or malfunction is reset. |
| Misfeed processing location | - Transportation cover <br> - Opening and closing guide |  |
| Relevant parts | - Readi <br> - Readi <br> - Regis <br> - Before <br> - DF co | ```motor (M3) roller pressure/retraction motor (M6) tion sensor (PS5) read sensor (PS6) ol board (DFCB)``` |

## (2) Procedure

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | Make the adjustment of original stop position. | - | - |
| 3 | PS5 I/O check, sensor check | DFCB CN6-17 (ON) | DF 9-J |
| 4 | PS6 I/O check, sensor check | DFCB CN11-3 (ON) | DF 1-C |
| 5 | M3 operation check | DFCB CN2-1 to 6 | DF 12-C |
| 6 | M6 operation check | DFCB CN4-1 to 2 | DF 10-C |
| 7 | DFCB ICP1 or ICP16 conduction check. | - | - |
| 8 | Replace DFCB. | - | - |

### 1.17.9 72-22

(1) Contents

| JAM type | Misfeed at FS transport section |  |  |
| :---: | :---: | :---: | :---: |
| JAM code | 72-22 |  |  |
| JAM detection timing | 72-22 | <When FS-536 or FS-536SD is installed> | The sub tray exit sensor (PS8) is not turned ON (blocked) even after the set period of time has elapsed after the paper reaches the paper transport acceleration point. |
|  |  | <When FS-537 or FS-537SD is installed> | The sub tray exit sensor (PS24) is not turned ON (blocked) even after the set period of time has elapsed after the paper reaches the paper transport acceleration point. |
| Misfeed processing location | Front door |  |  |
| Relevant parts | <When FS-536 or FS-536SD is installed> |  | - Sub tray exit sensor (PS8) <br> - FS control board (FSCB) |
|  | <When FS-537 or FS-537SD is installed> |  | - Sub tray exit sensor (PS24) <br> - FS control board (FSCB) |

## (2) Procedure

(a) When FS-536 or FS-536SD is installed

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | PS8 I/O check, sensor check | FSCB J9<B>-8 (ON) | FS-536/FS-536SD 11-C |
| 3 | Replace FSCB. | - | - |

- Link to the wiring diagram ( N.4.15 FS-536/FS-536SD)
(b) When FS-537 or FS-537SD is installed

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | PS24 I/O check, sensor check | FSCB J15-3 (ON) | FS-537/FS-537SD 16-K to L |

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 3 | Replace FSCB. | - | - |

- Link to the wiring diagram ( N.4.16 FS-537/FS-537SD)
1.17.10 72-23
(1) Contents

| JAM type | Misfeed at FS transport section |  |  |
| :---: | :---: | :---: | :---: |
| JAM code | 72-23 |  |  |
| JAM detection timing | 72-23 | <When FS-536 or FS-536SD is installed> | The sub tray exit sensor (PS8) is not turned OFF (unblocked) even after the set period of time has elapsed after it is turned ON (blocked) |
|  |  | <When FS-537 or FS-537SD is installed> | The sub tray exit sensor (PS24) is not turned OFF (unblocked) even after the set period of time has elapsed after PS24 turns ON (block). |
| Misfeed processing location | Front door |  |  |
| Relevant parts | <When FS-536 or FS-536SD is installed> |  | - Sub tray exit sensor (PS8) <br> - FNS entrance sensor (PS4) <br> - Main tray exit sensor (PS16) <br> - FS control board (FSCB) |
|  | <When FS-537 or FS-537SD is installed> |  | - Sub tray exit sensor (PS24) <br> - FNS entrance sensor (PS34) <br> - FNS middle sensor (PS36) <br> - Main tray exit sensor (PS37) <br> - FS control board (FSCB) |

## (2) Procedure

(a) When FS-536 or FS-536SD is installed

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | Clean the sensor of paper path. | - | - |
| 3 | PS8 I/O check, sensor check | FSCB J9<B>-8 (ON) | FS-536/FS-536SD 11-C |
| 4 | Replace FSCB. | - | - |

- Link to the wiring diagram ( N.4.15 FS-536/FS-536SD)
(b) When FS-537 or FS-537SD is installed

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | Clean the sensor of paper path. | - | - |
| 3 | PS24 I/O check, sensor check | FSCB J15-3 (ON) | FS-537/FS-537SD 16-K to L |
| 4 | Replace FSCB. | - | - |

- Link to the wiring diagram ( N.4.16 FS-537/FS-537SD)

### 1.17.11 72-25, 72-26

## (1) Contents

| JAM type | Misfeed at SD paper exit section |  |  |
| :---: | :---: | :---: | :---: |
| JAM code | 72-25, 72-26 |  |  |
| JAM detection timing | 72-25 | <When FS-536SD or FS-537SD is installed> | The fold exit sensor (PS12) is not turned ON by the paper even after the set period of time has elapsed after the half-fold exit operation started. |
|  | 72-26 | <When FS-536SD or FS-537SD is installed> | The fold exit sensor (PS12) is not turned OFF even after the set period of time has elapsed after it is turned ON by the paper. |
| Misfeed processing location | - Front door <br> - Stacker unit |  |  |
| Relevant parts | <When FS-536SD or FS-537SD is installed> |  | - Fold exit sensor (PS12) <br> - SD control board (SDCB) <br> - FS control board (FSCB) |

## (2) Procedure

(a) When FS-536SD or FS-537SD is installed

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | PS12 I/O check, sensor check | SDCB J9-2 (ON) | FS-536/FS-536SD 5-P |
| 3 | Replace SDCB. (FS-536SD / FS-537SD) |  | FS-537/FS-537SD 4-P |

| Step | Action | Control signal | Location of electrical component |
| :---: | :---: | :---: | :---: |
| 4 | Replace FSCB. (FS-536SD / FS-537SD) | - | - |

- Link to the wiring diagram ( N.4.15 FS-536/FS-536SD)
- Link to the wiring diagram ( N.4.16 FS-537/FS-537SD)

### 1.17.12 72-31, 72-34

(1) Contents

| JAM type | Misfeed at JS exit section |  |  |
| :---: | :---: | :---: | :---: |
| JAM code | 72-31, 72-34 |  |  |
| JAM detection timing | 72-31 | <When FS-537+JS-602 or FS-537SD+JS-602 is installed> | The job tray paper exit sensor (PS402) is not turned ON (unblocked) even after the set period of time has elapsed after the route change gate home sensor (PS21) turns OFF (unblock) by the paper. |
|  | 72-34 | <When FS-537+JS-602 or FS-537SD+JS-602 is installed> | The job tray paper exit sensor (PS402) is not turned OFF (unblocked) even after the set period of time has elapsed after PS402 turns ON (block) by a paper. |
| Misfeed processing location | Separator cover |  |  |
| Relevant parts | <When FS-537+JS-602 or FS-537SD <br> $+J S-602$ is installed> |  | - Job tray paper exit sensor (PS402) <br> - FS control board (FSCB) |

## (2) Procedure

(a) When FS-537+JS-602 or FS-537SD+JS-602 is installed

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | PS402 I/O check, sensor check | FSCB J10-6 (ON) | FS-537/FS-537SD 9-M |
| 3 | Replace FSCB. | - | - |

- Link to the wiring diagram ( N.4.16 FS-537/FS-537SD)
1.17.13 72-35
(1) Contents

| JAM type | Misfeed at PI section |  |  |
| :---: | :---: | :---: | :---: |
| JAM code | 72-35 |  |  |
| JAM detection timing | 72-35 | <When FS-537+PI-507 or FS-537SD+PI-507 is installed> | When a paper is fed from the upper tray, the paper entrance sensor / Lw (PS206) is not turned ON (unblocked) even after the set period of time has elapsed after the transfer clutch /Up (CL201) turns ON by a paper. <br> When a paper is fed from the lower tray, The paper entrance sensor / Lw (PS206) is not turned ON (unblocked) even after the set period of time has elapsed after the transfer clutch /Lw (CL202) turns ON by a paper. |
| Misfeed processing location | Upper door |  |  |
| Relevant parts | <When FS-537+PI-507 or FS-537SD $+\mathrm{PI}-507$ is installed> |  | - Transfer clutch /Up (CL201) <br> - Transfer clutch /Lw (CL202) <br> - Paper entrance sensor /Lw (PS206) <br> - PI drive board (PIDB) <br> - FS control board (FSCB) |

## (2) Procedure

(a) When FS-537+PI-507 or FS-537SD+PI-507 is installed

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | PS206 I/O check, sensor check | PIDB CN53<A>-5 (ON) | PI-507 10-C |
| 3 | CL201 operation check | PIDB CN54-3 (ON) | PI-507 6-C |
| 4 | CL202 operation check | PIDB CN56-1 (ON) | PI-507 9-C |
| 5 | PIDB ICP4 conduction check. | - | - |
| 6 | Replace PIDB. | - | - |
| 7 | Replace FSCB. | - | - |

- Link to the wiring diagram ( N.4.19 PI-507)

### 1.17.14 72-40, 72-41

## (1) Contents

| JAM type | Misfeed at ZU section |
| :--- | :--- |

| JAM code | 72-40, 72-41 |  |  |
| :---: | :---: | :---: | :---: |
| JAM detection timing | 72-40 | <When FS-537+ZU-609 or FS-537SD+ZU-609 is installed> | The FNS middle sensor (PS36) is not turned OFF even after the set period of time has elapsed after it is turned ON by the paper. |
|  | 71-41 | <When FS-537+ZU-609 or FS-537SD+ZU-609 is installed> | When the second fold is started in Z-fold mode, the FNS middle sensor (PS36) is not switched from ON to OFF by the paper after the set period of time has elapsed. |
| Misfeed processing location | Front door |  |  |
| Relevant parts | <When FS-537+ZU-609 or FS-537SD $+Z U-609$ is installed> |  | - ZU transport motor (M500) <br> - Folding guide motor (M501) <br> - FNS middle sensor (PS36) <br> - ZU drive board (ZUDB) <br> - FS control board (FSCB) |

## (2) Procedure

(a) When FS-537+ZU-609 or FS-537SD+ZU-609 is installed

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | PS36 I/O check, sensor check | FSCB J12<A>-10 (ON) | FS-537/FS-537SD 16-D |
| 3 | M500 operation check | ZUDB CN6-1 to 6 | ZU-609 1 to 2-B |
| 4 | M501 operation check | ZUDB CN6-9 to 12 | ZU-609 2-B |
| 5 | ZUDB ICP1 or ICP2 conduction check. | - | - |
| 6 | Replace ZUDB. | - | - |
| 7 | Replace FSCB. | - | - |

- Link to the wiring diagram ( N.4.16 FS-537/FS-537SD)
- Link to the wiring diagram ( N.4.18 ZU-609)

### 1.17.15 72-43

(1) Contents

| JAM type | Misfeed at PK JAM |  |  |
| :---: | :---: | :---: | :---: |
| JAM code | 72-43 |  |  |
| JAM detection timing | 72-43 | <When FS-533+PK-519 is installed> | The punch motor sensor (PS202) does not detect rotation of the punch motor after the laps of given time after the punch motor (M201) started operating. |
|  |  | <When FS-536+PK-520 or FS-536SD+PK-520 is installed> | The punch position sensor (PS2) is not turned ON (unblocked) after a lapse of a given time after the punch drive motor (M1) starts rotating. |
|  |  | <When FS-537+PK-523 or FS-537SD+PK-523 is installed> | The PK punch home sensor/2 (PS301) is not turned ON (unblocked) after a lapse of a given time after the punch drive motor (M301) starts rotating. |
|  | - | <When FS-537+PK-523 or FS-537SD+PK-523 is installed> | Paper jam of a sheet of paper left at the PK section results, when the main power switch is turned ON, and the paper is detected by the paper size detect board (PSDTB). |
| Misfeed processing location | - Finisher punch section (When FS-533+PK-519 is installed) <br> - Front door (When FS-536+PK-520, FS-536SD+PK-520, FS-537+PK-523, or FS-537SD+PK-523 is installed) |  |  |
| Relevant parts | <When FS-533+PK-519 is installed> |  | - Punch motor (M201) <br> - Punch motor sensor (PS202) <br> - PK control board (PKCB) <br> - FS control board (FSCB) |
|  | <When FS-536+PK-520 or FS-536SD + PK-520 is installed> |  | - Punch drive motor (M1) <br> - Punch position sensor (PS2) <br> - FS control board (FSCB) |
|  | <When FS-537+PK-523 or FS-537SD <br> +PK-523 is installed> |  | - Punch drive motor (M301) <br> - PK punch home sensor/2 (PS301) <br> - Punch control board (PKCB) <br> - FS control board (FSCB) |
|  | Residual paper jam |  | - Paper size detect board (PSDTB) <br> - FS control board (FSCB) |

## (2) Procedure

(a) When FS-533+PK-519 is installed

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 2 | PS202 I/O check, sensor check | PKCB CN204 | FS-533 (PK-519) 5-C |
| 3 | M201 operation check | PKCB CN203-1 to 2 | FS-533 (PK-519) 4-C |
| 4 | Replace PKCB. | - | - |
| 5 | Replace FSCB. | - | - |

- Link to the wiring diagram ( N.4.11 FS-533)
(b) When FS-536+PK-520 or FS-536SD+PK-520 is installed

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | PS2 I/O check, sensor check | FSCB J7-2 (ON) | FS-536/FS-536SD (PK-520) 13-K |
| 3 | M1 operation check | FSCB J7-7 to 8 | FS-536/FS-536SD (PK-520) 13-K |
| 4 | Replace FSCB. | - | - |

- Link to the wiring diagram ( N.4.15 FS-536/FS-536SD)
(c) When FS-537+PK-523 or FS-537SD+PK-523 is installed

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | PS301 I/O check, sensor check | PKCB CN36-5 (ON) | PK-523 3-C |
| 3 | M301 operation check | PKCB CN35-1 to 3 | PK-523 2-C |
| 4 | Replace PKCB. | - | - |
| 5 | Replace FSCB. | - | - |

- Link to the wiring diagram ( N.4.17 PK-523)
(d) Residual paper jam (When FS-537+PK-523 or FS-537SD+PK-523 is installed)

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | Adjust the sensitivity (light intensity) by selecting <br> [Finisher] -> [FS-FN adjustment] -> [Punch F. Sensor <br> Intensity Adj.]. After adjustment, open and then close <br> the front door, and check if the residual paper jam <br> indication disappears. To turn off the main power <br> switch, wait for more than 10 seconds until the residual <br> paper jam indication disappears | - | - |
| 3 | Replace PSDTB. | - |  |
| 4 | Replace FSCB. | - | - |

### 1.17.16 72-49

(1) Contents

| JAM type | Misfeed at PI section |  |  |
| :---: | :---: | :---: | :---: |
| JAM code | 72-49 |  |  |
| JAM detection timing | 72-49 | <When FS-537+PI-507 or FS-537SD+PI-507 is installed> | The paper entrance sensor /Up (PS201) is not turned ON (unblocked) after a lapse of a given time after the transfer clutch /Up is turned ON. |
| Misfeed processing location | Upper door |  |  |
| Relevant parts | <When FS-537+PI-507 or FS-537SD <br> $+\mathrm{PI}-507$ is installed> |  | - Transfer clutch /Up (CL201) <br> - Paper entrance sensor /Up (PS201) <br> - PI drive board (PIDB) <br> - FS control board (FSCB) |

## (2) Procedure

(a) When FS-537+PI-507 or FS-537SD+PI-507 is installed

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | PS201 I/O check, sensor check | PIDB CN53<A>-2 (ON) | PI-507 10-C |
| 3 | CL201 operation check | PIDB CN54-3 (ON) | PI-507 6-C |
| 4 | PIDB ICP4 conduction check. | - | - |
| 5 | Replace PIDB. | - | - |
| 6 | Replace FSCB. | - | - |

[^44]
### 1.17.17 72-50

## (1) Contents

| JAM type | Misfeed at PI section |  |  |
| :---: | :---: | :---: | :---: |
| JAM code | 72-50 |  |  |
| JAM detection timing | 72-50 | $\begin{aligned} & \text { <When FS-537+PI-507 or } \\ & \text { FS-537SD+PI-507 is } \\ & \text { installed> } \end{aligned}$ | The FNS entrance sensor (PS34) is not turned ON even after the set period of time has elapsed after the paper entrance sensor /Up (PS201) turns ON (unblock) by a paper. |
| Misfeed processing location | Upper door |  |  |
| Relevant parts | <When FS-537+PI-507 or FS-537SD <br> $+\mathrm{PI}-507$ is installed> |  | - Paper entrance sensor /Up (PS201) <br> - FNS entrance sensor (PS34) <br> - PI drive board (PIDB) <br> - FS control board (FSCB) |

## (2) Procedure

(a) When FS-537+PI-507 or FS-537SD+PI-507 is installed

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | PS201 I/O check, sensor check | PIDB CN53<A>-2 (ON) | PI-507 10-C |
| 3 | PS34 I/O check, sensor check | FSCB J8<A>-5 (ON) | FS-537/FS-537SD 7-D |
| 4 | PIDB ICP4 conduction check. | - | - |
| 5 | Replace PIDB. | - | - |
| 6 | Replace FSCB. | - | - |

### 1.17.19 72-70

(1) Contents

| JAM type | Misfeed at PK JAM |  |  |
| :---: | :---: | :---: | :---: |
| JAM code | 72-70 |  |  |
| JAM detection timing | 72-70 | <When FS-533+PK-519 is installed> | The paper feed sensor (PS201) is not turned OFF even after the set period of time has elapsed after it is turned ON. |
| Misfeed processing location | Finisher punch section |  |  |
| Relevant parts | - Fusing motor (M3) <br> - Paper conveyance motor (M101) <br> - Paper feed sensor (PS201) |  |  |

## (2) Procedure

(a) When FS-533+PK-519 is installed

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | PS201 I/O check, sensor check | PKCB CN204 | FS-533 (PK-519) 5-C |
| 3 | M3 operation check | MFPB CN14E-9 (REM) <br> MFPB CN41E-12 (LOCK) | 2-C |
| 4 | M101 operation check | FSCB CN101 | FS-533 6-J |
| 5 | Replace FSCB. | - | - |

- Link to the wiring diagram ( N. 2 bizhub C658/C558/C458)
- Link to the wiring diagram ( N.4.11 FS-533)

### 1.17.20 72-81

(1) Contents

| JAM type | Misfeed at FS staple section |  |  |
| :---: | :---: | :---: | :---: |
| JAM code | 72-81 |  |  |
| JAM detection timing | 72-81 | <When FS-533 is installed> | The stapler home sensor (PS110) is not turned ON (blocked) after the stapler motor is energized. |
|  |  | <When FS-536 or FS-536SD is installed> | The stapler position sensor (center) (PS24) is not turned ON (blocked) or OFF (unblocked) even after the set period of time has elapsed after the side stapler movement motor (M13) turned ON. |
|  |  | <When FS-537 or FS-537SD is installed> | The stapler position sensor (center) (PS20) is not turned ON (blocked) or OFF (unblocked) even after the set period of time has elapsed after the stapler movement motor (M19) turned ON. |
| Misfeed processing location | - Finisher staple section (When FS-533 is installed) <br> - Front door (When FS-536, FS-536SD, FS-537, or FS-537SD is installed) |  |  |
| Relevant parts | <When FS-533 is installed> |  | - Stapler home sensor (PS110) <br> - Stapler unit <br> - Stapler relay board (STREYB) <br> - FS control board (FSCB) |
|  | <When FS-536 or FS-536SD is installed> |  | - Side stapler movement motor (M13) <br> - Stapler position sensor (Center) (PS24) <br> - FS control board (FSCB) |
|  | <When FS-537 or FS-537SD is installed> |  | - Stapler movement motor (M19) <br> - Stapler position sensor (Center) (PS20) <br> - FS control board (FSCB) |

## (2) Procedure

(a) When FS-533 is installed

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | PS110 I/O check, sensor check | FSCB CN110 | FS-533 8-D to E |
| 3 | Replace the stapler unit. | - | - |
| 4 | Replace STREYB. | - | - |
| 5 | Replace FSCB. | - | - |

## (1) Contents

| JAM type | Controller JAM (finisher not starting a job) |  |  |
| :--- | :---: | :--- | :---: |
| JAM code | $99-08$ |  |  |
| JAM detection timing | $99-08$ | The finisher does not accept a print start command. |  |
| Misfeed processing <br> location |  |  |  |
| Relevant parts |  |  |  |

## (2) Procedure

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | Open and close the lower front door of the main body. <br> Or, open and close the front door of the finisher. | - | - |

### 1.19.11 99-09

## (1) Contents

| JAM type | Controller JAM (finisher not completing a job) |  |  |  |
| :--- | :---: | :--- | :---: | :---: |
| JAM code | $99-09$ | • A paper exit or paper finishing process inside the finisher is not completed. <br> • The finisher does not start during a reset procedure from the jam. |  |  |
| JAM detection timing | $99-09$ |  |  |  |
| Misfeed processing <br> location |  |  |  |  |
| Relevant parts |  |  |  |  |

(2) Procedure

| Step | Action | Control signal | Location of electrical component |
| :---: | :--- | :---: | :---: |
| 1 | Initial check items | - | - |
| 2 | Open and close the lower front door of the main body. <br> Or, open and close the front door of the finisher. | - | - |

## 2. MALFUNCTION CODE

### 2.1 Display procedure

- The machine's CPU performs a self-diagnostics function that, on detecting a malfunction, gives the corresponding warning code and maintenance call mark on the control panel.
- Touching the maintenance call mark will display the corresponding warning code on the state confirm screen.

### 2.2 List of the malfunction code

- If an image stabilization or scanner fault occurs, the corresponding warning code appears.

| Malfunction code |  |
| :---: | :--- |
| S-1 | CCD gain adjustment failure |
| S-2 | CIS gain adjustment failure * 1 |
| D-1 | Split line detect (front side) |
| D-3 | Split line detect (back side) * 1 |
| P-5 | IDC sensor/Fr failure |
| P-28 | IDC sensor/Rr failure |
| P-6 | Drum/Development unit (C) failure |
| P-7 | Drum/Development unit (M) failure |
| P-8 | Drum/Development unit (Y) failure |
| P-9 | Drum/Development unit (K) failure |
| P-14 | Skew correction trouble |
| P-21 | Color regist test pattern failure |
| P-22 | Color regist adjust failure |
| P-27 | Secondary transfer ATVC failure |
| P-32 | Heating roller temperature sensor1 temperature detection failure *2 |
| P-33 | LD malfunction |

- *1: bizhub C368/C308/C258: When DF-704 is installed, bizhub C658/C558/C458
- *2: bizhub C658/C558

### 2.3 S-1

### 2.3.1 Contents

| Malfunction type | CCD gain adjustment failure |
| :--- | :--- |
| Malfunction code | S-1 |
| Malfunction detection timing | It is detected that the CCD clamp gain adjustment value is faulty. |
| Relevant parts | • LED exposure unit <br>  <br>  <br>  <br> • Scanner drive board (SCDB) <br>  • MFP board (CCDB) |

### 2.3.2 Procedure

1. Correct the harness connection between CCDB CN3-MFPB CN1 if faulty.
2. Check for possible extraneous light and correct as necessary.
3. Clean the lens, mirrors, CCD surface, and shading sheet if dirty.
4. Correct reflective mirror of the scanner if faulty, or change scanner mirror.
5. Replace the CCD unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
6. Replace SCDB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
7. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

### 2.4 S-2

### 2.4.1 Contents

| Malfunction type | CIS gain adjustment failure (bizhub C368/C308/C258: When DF-704 is installed, bizhub C658/C558/C458) |
| :--- | :--- |
| Malfunction code | S-2 |
| Malfunction detection timing | It is detected that the CIS clamp gain adjustment value is faulty. |
| Relevant parts | • CIS module (CIS) <br>  <br>  <br>  <br> • Dual scan image processing board (DSIPB) |

### 2.4.2 Procedure

1. Correct the harness connection between CIS and DSIPB if faulty.
2. Correct the harness connection between DSIPB CN01-MFPB CN22 if faulty.
3. Check for possible extraneous light and correct as necessary.
4. Wipe clean the back side scanning glass surface and shading sheet.
5. Replace CIS. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
6. Replace DSIPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
7. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

### 2.5 D-1 (bizhub C368/C308/C258)

### 2.5.1 Contents

| Malfunction type | Split line detect (front side) |  |
| :---: | :---: | :---: |
| Malfunction code | D-1 |  |
| Malfunction detection timing | - While recovering from the power save mode or when the main power switch and power key are ON, it detects whether or not stain exist at the document reading glass when the DF is closed. This warning will be displayed if the original is set to DF when stain exist. <br> - The thin line detection level and the warning display can be changed by [Service Mode] -> [System 2] -> [ADF Scan Glass Contamin. Set.] -> [Front Side]. |  |
| Relevant parts | <When DF-629 is installed> | - Glass cleaning motor (M4) <br> - Document reading glass cleaning sensor (PS12) <br> - DF control board (DFCB) |
|  | <When DF-704 is installed> | - Document reading glass cleaning motor (M6) <br> - Document reading glass cleaning sensor (PS13) <br> - DF control board (DFCB) |

### 2.5.2 Procedure

When DF-629 is installed

1. Wipe clean the document reading glass surface.
2. Check the glass cleaning roller unit for proper installation and correct if necessary. Clean the glass cleaning roller unit if dirty.
3. Select [Service Mode] -> [System 2] ->[ADF Scan Glass Contamin. Set.] -> [Front Side], and change the setting.
4. Check the DFCB connector for proper connection and correct as necessary.
5. M4 operation check.
6. Replace the glass cleaning roller unit.
7. Replace DFCB.

When DF-704 is installed

1. Wipe clean the document reading glass surface.
2. Check the front side glass cleaning roller unit for proper installation and correct if necessary. Clean the front side glass cleaning roller unit if dirty.
3. Select [Service Mode] -> [System 2] ->[ADF Scan Glass Contamin. Set.] -> [Front Side], and change the setting.
4. Check the DFCB connector for proper connection and correct as necessary.
5. M6 operation check
6. Replace the front side glass cleaning roller unit.
7. Replace DFCB.

### 2.6 D-1 (bizhub C658/C558/C458)

### 2.6.1 Contents

| Malfunction type | Split line detect (front side) |
| :--- | :--- |
| Malfunction code | $\mathrm{D}-1$ |

| Malfunction detection timing | - While recovering from the power save mode or when the main power switch and power key are ON, it <br> detects whether or not stain exist at the document reading glass when the dual scan document feeder is <br> closed. This warning will be displayed if the original is set to the reverse automatic document feeder <br> when stain exist. |
| :--- | :--- | :--- |
|  | -The thin line detection level and the warning display can be changed by [Service Mode] -> [System 2] -> <br> [ADF Scan Glass Contamin. Set.] -> [Front Side]. <br> Relevant parts <br>  <br>  <br>  <br> - Front side cleaning motor (M8) <br> - Front side cleaning home sensor (PS18) <br> - DF control board (DFCB) |

### 2.6.2 Procedure

1. Wipe clean the document reading glass surface.
2. Check the front side glass cleaning roller unit for proper installation and correct if necessary. Clean the front side glass cleaning roller unit if dirty.
3. Select [Service Mode] -> [System 2] ->[ADF Scan Glass Contamin. Set.] -> [Front Side], and change the setting.
4. Check the DFCB connector for proper connection and correct as necessary.
5. M8 operation check
6. Replace the front side glass cleaning roller unit.
7. Replace DFCB.

### 2.7 D-3

### 2.7.1 Contents

| Malfunction type | Split line detect (back side) (bizhub C368/C308/C258: When DF-704 is installed, bizhub C658/C558/C458) |
| :---: | :---: |
| Malfunction code | D-3 |
| Malfunction detection timing | - While recovering from the power save mode or when the main power switch and power key are ON, it detects whether or not stain exist at the back side original scanning section (CIS) when the DF is closed. This warning will be displayed if the original is set to DF when stain exist. <br> - The thin line detection level and the warning display can be changed by [Service Mode] -> [System 2] -> [ADF Scan Glass Contamin. Set.] -> [Back Side]. |
| Relevant parts | - CIS module (CIS) <br> - bizhub C368/C308/C258: CIS power supply (CISPU) <br> - bizhub C658/C558/C458: DF power supply (DFPU) <br> - Dual scan image processing board (DSIPB) |

### 2.7.2 Procedure

1. Wipe clean the CIS glass surface.
2. Check the back side glass cleaning roller unit for proper installation and correct if necessary. Clean the back side glass cleaning roller unit if dirty.
3. If there is a problem in the CIS module connection, correct the faulty connection.
4. Replace CIS. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
5. Replace CISPU.
6. Replace DCPU.
7. Replace DSIPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

### 2.8 P-5, P-28

### 2.8.1 Contents

| Malfunction type | IDC sensor/Fr failure, IDC sensor/Rr failure |
| :--- | :--- |
| Malfunction code | $\mathrm{P}-5, \mathrm{P}-28$ |

### 2.8.2 Procedure

1. Wipe clean the surface of the transfer belt with a soft cloth, if it is dirty.
2. Replace the transfer belt unit if the transfer belt is damaged. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
3. Reinstall or reconnect IDCS/Fr assy or IDCS/Rr assy, sensor shutter or connector, if it is installed or connected improperly.
4. Clean IDCS/Fr or IDCS/Rr if it is dirty.
5. Check the HV connector for proper connection and correct as necessary.
6. SD2 operation check.
7. Open/close the front door, run an image stabilization sequence, and select [State Confirmation] -> [Level History 1] to check the IDC value. IDC1: IDCS/Fr
IDC2: IDCS/Rr
If the value is 1.0 V or less, replace IDCS/Fr or IDCS/Rr.
8. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

### 2.9 P-6, P-7, P-8, P-9

### 2.9.1 Contents

| Malfunction type | Drum/Development unit (C) failure, Drum/Development unit (M) failure, Drum/Development unit (Y) failure, Drum/Development unit (K) failure |
| :---: | :---: |
| Malfunction code | P-6, P-7, P-8, P-9 |
| Malfunction detection timing | - All density readings taken from the density pattern produced on the transfer belt are $1.0 \mathrm{~g} / \mathrm{m}^{2}$ (IDC sensor photo receiver output) or less during max. density adjustment ( $\mathrm{Vg} / \mathrm{Vdc}$ adjustment). <br> - All density readings taken from the density pattern produced on the transfer belt are $5.0 \mathrm{~g} / \mathrm{m}^{2}$ (IDC sensor photo receiver output) and more during max. density adjustment ( $\mathrm{Vg} / \mathrm{Vdc}$ adjustment). |
| Relevant parts | - Drum unit/Y,M,C,K <br> - Developing unit/Y,M,C,K <br> - IDC sensor/Fr (IDCS/Fr) <br> - IDC sensor/Rr (IDCS/Rr) <br> - IDC sensor shutter solenoid (SD2) <br> - MFP board (MFPB) <br> - High voltage unit (HV) <br> - Transfer belt unit |

### 2.9.2 Procedure

1. Select [Imaging Process Adjustment] -> [Max Image Density Adj] and, if the setting value is negative, readjust.
2. Check the drive transmission portion of the drum/developing unit and correct as necessary.
3. Clean the IDC sensor/Fr (IDCS/Fr) or IDC sensor/Rr (IDCS/Rr) window if dirty.
4. Clean the contact of the drum/developing unit connector if dirty.
5. Check the HV connector for proper connection and correct as necessary.
6. SD2 operation check.
7. Replace the drum unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
8. Replace the developing unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
9. Replace the transfer belt unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
10. Replace HV. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
11. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

### 2.10 P-14

### 2.10.1 Contents

| Malfunction type | Skew correction trouble |
| :--- | :--- |
| Malfunction code | P-14 |
| Malfunction detection timing | The difference between the skew default position setting value and the cumulative amount of skew <br> adjustment values goes over the predetermined value. |
| Relevant parts | - IDC sensor/Fr (IDCS/Fr) |
|  | - IDC sensor/Rr (IDCS/Rr) |
|  | • Drum unit/Y,M,C,K |
|  | - PH relay board (PHRYB) |
|  | - Front side board (FRB) |
|  | - MFP board (MFPB) |
|  | •PH unit |

### 2.10.2 Procedure

1. Check the drive transmission portion of the drum unit and correct as necessary.
2. Clean the contact of the drum unit connector if dirty.
3. Reinstall or reconnect IDCS/Fr assy or IDCS/Rr assy, sensor shutter or connector, if it is installed or connected improperly.
4. Clean IDCS/Fr or IDCS/Rr if it is dirty.
5. Check the FRB connector for proper connection and correct as necessary.
6. Check the PHRYB connector for proper connection and correct as necessary.
7. Check the connectors of the MFPB for proper connection and correct as necessary.
8. FRB fuse conduction check.
9. Replace FRB.
10. Replace IDCS/Fr assy or IDCS/Rr assy.
11. Replace the drum unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
12. Replace the PH unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
13. Replace PHRYB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
14. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

## NOTE

- After the PH unit is replaced, reset the skew default position for each color in [Service Mode] -> [Machine] -> [Print Head Skew Adj.] -> [Print Head Skew Adj.]
- When this alert code is displayed, according to the list, take actions to address the problem. After the problem is resolved, select [Service Mode] -> [Machine] -> [Print Head Skew Adj.] -> [Print Head Skew Reset] and perform the skew adjustment reset.

### 2.11 P-21

### 2.11.1 Contents

| Malfunction type | Color regist test pattern failure |
| :---: | :---: |
| Malfunction code | P-21 |
| Malfunction detection timing | - During pre-pattern detection, pre-pattern edge (start/ end point of effective area) is not detected within the pre-pattern search area. <br> - During detection of regist pattern at vertical/horizontal direction, pattern edge (start/end point of effective area) is not detected within the pattern search area of each unit. |
| Relevant parts | - Transfer belt unit <br> - PH unit <br> - IDC sensor shutter solenoid (SD2) <br> - Front side board (FRB) <br> - MFP board (MFPB) |

### 2.11.2 Procedure

1. Wipe clean the surface of the transfer belt with a soft cloth, if it is dirty.
2. Replace the transfer belt unit if the transfer belt is damaged. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
3. SD2 operation check.
4. Replace the PH unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
5. Replace FRB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
6. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

### 2.12 P-22

### 2.12.1 Contents

| Malfunction type | Color regist adjust failure |
| :--- | :--- |
| Malfunction code | $\mathrm{P}-22$ |

### 2.12.2 Procedure

1. Slide out the drum/developing unit and reinstall it in position.
2. Reinstall or reconnect IDCS/Fr assy or IDCS/Rr assy if it is installed or connected improperly.
3. Check the vertical transport guide for installed position and correct as necessary.
4. SD2 operation check.
5. Replace FRB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
6. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

### 2.13 P-27

### 2.13.1 Contents

| Malfunction type | Secondary transfer ATVC failure |
| :--- | :--- |
| Malfunction code | P-27 |
| Malfunction detection timing | An abnormal average value is detected during an adjustment of the second transfer ATVC value. |
| Relevant parts | - High voltage unit (HV) <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br> - MFP board (MFPB) Image transfer entrance guide <br> - 2nd transfer assy <br> - Transfer belt unit |

### 2.13.2 Procedure

1. Check the contact between the roller opposed to the 2 nd transfer roller in the transfer belt unit and the grounding terminal. Clean the joint or correct if necessary.
2. Check the image transfer entrance guide for proper installation and correct if necessary.
3. Check that the spring does not come off during the pressure operation of the 2nd transfer roller and correct if necessary.
4. Check the contact at the joint of the 2nd transfer assy and HV. Clean the joint or correct if necessary.
5. Replace the transfer belt unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
6. Replace HV. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
7. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

### 2.14 P-32 (bizhub C658/C558)

2.14.1 Contents

| Malfunction type | Heating roller temperature sensor1 temperature detection failure |
| :---: | :---: |
| Malfunction code | P-32 |
| Malfunction detection timing | - During warm up, the temperature detected by the heating roller thermistor3 exceeded the warm up complete temperature of the heating roller for over the predetermined value, and stayed for a predetermined period of time. <br> - When the predetermined period of time had passed after the warm up became complete, detected temperature of the heating roller thermistor3 exceeded the temperature detected by the heating roller temperature sensor 1 for over the predetermined value for more than the predetermined period of time. <br> - While printing, temperature detected by the heating roller thermistor3 exceeded the temperature detected by the heating roller temperature sensor1 for more than the predetermined value for a predetermined period of time. <br> - This warning indicates that condensation dirt on the heating roller temperature sensor1 was detected, and the alternate temperature control is being conducted. With condensation, the warning is cleared when the condensation is detected to be removed. When the dirt on the sensor is detected, it is considered as a failure and the trouble code C392A is issued. |
| Relevant parts | - Fusing unit <br> - Heating roller thermistor3 (TH3) <br> - Heating roller temperature sensor1 (TEMS) |

### 2.14.2 Procedure

1. Wipe the TEMS1 clean of dirt if any.
<Cleaning procedure>

- Clear away a dirt or a foreign object on the sensor with a cotton swab.
- When a dirt is left even if you cleaned the sensor by above procedure, clear away a dirt or a foreign object on the sensor using a cotton swab dampened with the alcohol. And, wipe off the sensor with a dry cotton swab afterwards.

2. Check the connection of the fusing unit.
3. Replace the fusing unit.

### 2.15 P-33

### 2.15.1 Contents

| Malfunction type | LD malfunction |
| :--- | :--- |
| Malfunction code | P-33 |
| Malfunction detection timing | The DETOUT signal of the LD drive detected malfunction consecutively for the predetermined frequency. |
| Relevant parts | • Laser diode/Y (LD/Y) |
|  | - Laser diode/M (LD/M) |
|  | - Laser diode/C (LD/C) |
|  | - Laser diode/K (LD/K) |
|  | • Laser drive board (LDDB) |
|  | - PH unit |
|  | •PH relay board (PHRYB) |
|  | •MFP board (MFPB) |

### 2.15.2 Procedure

1. Replace the PH unit. (bizhub $\mathrm{C} 368 / \mathrm{C} 308 / \mathrm{C} 258$ / bizhub $\mathrm{C} 658 / \mathrm{C} 558 / \mathrm{C} 458$ )
2. Replace PHRYB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
3. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

## 3. TROUBLE CODE

### 3.1 Overview of Trouble Code

- The machine's CPU performs a self-diagnostics function that, on detecting a malfunction, gives the corresponding malfunction code on the control panel.

### 3.2 Overview of Troubleshooting Procedure

- When a trouble code is displayed, confirm that if the displayed code is the target of the "Self-diag. (Full)". (Check the "Self-diag. (Full)" field on the List of the trouble code)
- If it is the target of the self-diagnosis, execute the "Self-diag. (Full)"

If [NG] is displayed as the result of the "Self-diag. (Full)", perform the troubleshooting against each item of "Error Code".

- If it is not the target of the self-diagnosis, perform the troubleshooting against each item of "Trouble Code".

NOTE

- Only in the case that trouble cannot be resolved even after the troubleshooting against each item of "Error Code" from the "Self-diag. (Full)", perform the troubleshooting against each item of "Trouble Code".
- After the troubleshooting against each item of "Trouble Code", execute the "Self-diag. (Full)" again, and make sure that all troubles on each device have been resolved.
Troubleshooting Flow

### 3.2.1 Troubleshooting Procedure

1. Display the trouble code.
2. Execute Self-diag. (Full), and perform the troubleshooting against each [Error Code].
3. After the troubleshooting against each error code, if the trouble code is displayed again, perform the troubleshooting against each trouble code.
NOTE

- Perform the troubleshooting in the sequence from step 1 of "Corrective action procedure" against each item while checking that if each trouble has been resolved. Do not perform the troubleshooting against all troubles at once.
- At "Troubleshooting against each error code" and "Troubleshooting against each trouble code", if the parts to be replaced are the same (ex. MFP board), do not replace the same parts twice. (Because the trouble can hardly be resolved even after replacing the same parts twice)

4. Perform the troubleshooting against each trouble code, and make sure that the trouble has be resolved.
5. After the troubleshooting against each trouble code, execute the "Self-diag. (Full)" again, and make sure that all troubles on each device have been resolved.

### 3.3 Trouble resetting procedure

- Different malfunction resetting procedures apply depending on the rank of the trouble code.
* List of malfunction resetting procedures

| Trouble code rank | $\quad$ Resetting procedures |
| :--- | :--- |
| Rank A | Trouble reset: Refer to the Trouble resetting procedure by Trouble Reset key. |
| Rank B | - Opening/closing the front door (bizhub C368/C308/C258) <br> - Opening/closing the lower front door (bizhub C658/C558/C458) <br> - Trouble reset: <br> - When the [Internal Error. Auto Cancel] for rank B is set to "Yes", after the set period of time, trouble is <br> automatically cleared. |
| Rank C | - Turning main power switch OFF/ON <br> - When the [Internal Error. Auto Cancel] for rank C is set to "Yes", after the set period of time, trouble is <br> restarted and cleared. |

### 3.3.1 Trouble resetting procedure by Trouble Reset key

(1) Use

- If the all troubles occur and the status would not be cleared by turning main power switch OFF and ON again, or opening and closing the front door, clear the status of the machine.
- To be used when the status would not be cleared by turning main power switch OFF and ON again, or opening and closing the front door in case of a trouble.
(2) Procedure

1. Turn OFF the main power switch.
2. Turn main power switch ON while pressing the Reset key.
3. Touch [Trouble Reset].
4. Check to make sure that $[\mathrm{OK}]$ is displayed and it has been reset.
5. After turning off the main power switch, turn it on again more than 10 seconds after and check if the machine starts correctly.

### 3.3.2 Trouble resetting procedure by the auto cancel function

(1) Use

- When rank B or C trouble occurs, main body automatically clears trouble and makes the main body ready for use.

When the trouble auto cancel function is enabled, upon the occurrence of trouble to be automatically cleared, the trouble detection message is displayed on the screen and the trouble is automatically cleared. If the trouble remains after performing the auto cancel operation 3 times, the normal trouble code display screen appears.

## (2) Procedure

1. Select [Yes] for the trouble rank to which the trouble auto cancel operation is applied in [Service Mode] -> [System 2] -> [ $\downarrow$ ] -> [Internal Error. Auto Cancel]. (The default setting for rank B and rank C are set to [Yes].)
2. Touch $[O K]$, and turning main power switch OFF and ON again.

### 3.3.3 Trouble resetting procedure by remote operation

(1) Use

- Trouble can be cleared by remote operation using the applications or CS Remote Care system.
- The combinations of the applications to be used and the ranks of trouble to be cleared are shown below.

| Application Trouble code rank | Rank A | Rank B | Rank C |
| :--- | :---: | :---: | :---: |
| PageScope Web Connection | Cannot be cleared | Can be cleared | Can be cleared |
| OpenAPI (PageScope Enterprise <br> Suite) | Cannot be cleared | Can be cleared | Can be cleared |
| CS Remote Care (Excluding <br> communications by fax modem) | Can be cleared | Can be cleared | Can be cleared |

## (2) Procedure

(a) PageScope Web Connection

1. Access PageScope Web Connection of the MFP where trouble occurs.
2. The screen for logging into Administrator Mode appears.
3. Check the following message appears; "An error has occurred. Do you want to clear the error?" Click [Trouble Reset].
4. Click [Trouble Reset] again in the confirmation screen.
5. Check that the MFP starts normally.
(b) OpenAPI (PageScope Enterprise Suite)
6. Access PageScope Enterprise Suite.
7. Select [Device List] -> [Device Management] -> [Device List] -> [Device List] -> [Device].
8. For rank B trouble, click [Trouble Reset]. For rank C trouble, click [Reset].
9. For rank B trouble, click the [Execute] button. For rank C trouble, click the [Execute] button in [Device Reset].
10. Check that the MFP starts normally.
(c) CS Remote Care

- Refer to the CS Remote Care Center manual.

### 3.4 Trouble isolation function

- The trouble isolation function enables you to control MFP temporarily isolating faulty units and options where the trouble isolation function can be applied when trouble occurs. This allows you to continue using the other units that are not affected and reduce down time that continues until CE resolves the problem.
- This function can be selected for the following units and options.
- Tray 1
- Tray 2
- Tray 3
- Tray 4
- LCT
- Manual
- Center Stapling
- Half-Fold
- Post Inserter (bizhub C658/C558/C458 only)
- Z fold (bizhub C658/C558/C458 only)
- Tri-fold
- Punch
- Staple
- Scanner
- ADF
- Expansion Function (HDD)
- If a problem occurs with the units where the trouble isolation function can be applied, the control panel displays a trouble code and a key with which you decide whether to continue using the MFP. When you press down the key, the control panel displays the units that will be isolated as well as the next confirmation key with which you decide to continue.
- When you press down the confirmation key, the message on the control panel asks you to turn OFF and ON the main power switch. After turning OFF and ON the main power switch, the MFP starts operating, isolating the faulty units. The message on the control panel also tells that the MFP is working, isolating the faulty units.
- To temporarily isolate faulty units and continue using the MFP with the trouble isolation function, be sure to make the above mentioned control panel operation. The faulty units cannot be automatically isolated.
NOTE
- The malfunction detection mechanism is not applied to units and options that are being isolated.

### 3.5 List of the trouble code (bizhub C358/C308/C258)

| Code | Item | Rank | Self-diag. (Full) |
| :---: | :---: | :---: | :---: |
| C0002 | Paper feed communication error | C | - |
| C0106 | Tray 3/transfer LCT paper feed motor turning at abnormal timing (When PC-110, PC-210, or PC-410 is installed) | B | - |
| C0107 | Tray 3/transfer LCT vertical transport motor turning at abnormal timing (When PC-110, PC-210, or PC-410 is installed) | B | - |
| C0108 | Tray 4 paper feed motor turning at abnormal timing (When PC-210 is installed) | B | - |
| C0109 | Tray 4 vertical transport motor turning at abnormal timing (When PC-210 is installed) | B | - |
| C0202 | Tray 1 feeder up/down abnormality | B | - |
| C0204 | Tray 2 feeder up/down abnormality | B | - |
| C0206 | Tray 3 feeder up/down abnormality (When PC-110 or PC-210 is installed) | B | - |
| C0208 | Tray 4 feeder up/down abnormality (When PC-210 is installed) | B | - |
| C0210 | Transfer LCT lift failure (When PC-410 is installed) | B | - |
| C0211 | Manual feed up/down abnormality | B | - |
| C0214 | Transfer LCT shift failure (When PC-410 is installed) | B | - |
| C0216 | External LCT up/down abnormality (When LU-302 is installed) | B | - |
| C1004 | FNS communication error (When FS-533, FS-534, FS-534SD or JS-506 is installed) | C | - |
| C1081 | SD communication error (When FS-534SD is installed) | C | - |
| C1102 | Main tray up/down motor drive malfunction (When FS-533, FS-534 or FS-534SD is installed) | B | - |
| C1103 | Alignment plate motor/Fr malfunction (When FS-533, FS-534 or FS-534SD is installed) | B | - |
| C1105 | Bundle eject motor drive malfunction (When FS-534 or FS-534SD is installed) | B | - |
| C1106 | Stapler movement motor malfunction (When FS-533, FS-534 or FS-534SD is installed) | B | - |
| C1109 | Stapler motor drive malfunction (When FS-533, FS-534 or FS-534SD is installed) | B | - |
| C1112 | Stapler motor malfunction (When FS-534SD is installed) | B | - |
| C1113 | Center-staple lead edge stopper motor malfunction (When FS-534SD is installed) | B | - |
| C1114 | Center-staple front adjust drive motor malfunction (When FS-534SD is installed) | B | - |
| C1115 | Center-staple knife drive motor malfunction (When FS-534SD is installed) | B | - |
| C1132 | Punch drive motor malfunction (When FS-533+PK-519, FS-534+PK-520 or FS-534SD+PK-520 is installed) | B | - |
| C1140 | Alignment plate motor/Rr malfunction (When FS-533, FS-534 or FS-534SD is installed) | B | - |
| C1141 | Paddle motor drive malfunction (When FS-534 or FS-534SD is installed) | B | - |
| C1144 | Pre-eject drive motor malfunction (When FS-534 or FS-534SD is installed) | B | - |
| C1145 | Trailing edge stopper motor malfunction (When FS-534 or FS-534SD is installed) | B | - |
| C1156 | SD paddle motor malfunction (When FS-534SD is installed) | B | - |
| C1182 | Shift motor drive malfunction (When JS-506 is installed) | B | - |
| C1184 | Paper discharge control motor malfunction (When FS-534 or FS-534SD is installed) | B | - |
| C1195 | Paper discharge control motor malfunction (When FS-534SD is installed) | B | - |
| C1196 | Center fold roller motor malfunction (When FS-534SD is installed) | B | - |
| C1197 | Tri-folding guide motor malfunction (When FS-534SD is installed) | B | - |
| C11A1 | Exit roller pressure/ retraction malfunction (When FS-533 is installed) | B | - |
| C11A2 | Accommodation roller pressure/ retraction malfunction (When FS-534 or FS-534SD is installed) | B | - |
| C11E1 | Paper exit switching drive malfunction (When FS-534 or FS-534SD is installed) | B | - |
| C1402 | FS nonvolatile memory error (When FS-533 is installed) | C | - |
| C2152 | Transfer belt fault at initial position return | B | - |
| C2153 | Transfer belt spacing fault at K pressure switching | B | - |
| C2154 | Transfer belt contact fault at all pressure switching | B | - |

| Code | Item | Rank | Self-diag. (Full) |
| :---: | :---: | :---: | :---: |
| C2155 | Transfer belt contact fault after K pressure established | B | - |
| C2156 | Transfer belt spacing fault after all pressure established | B | - |
| C2253 | PC motor failure to turn | B | - |
| C2254 | PC motor turning at abnormal timing | B | - |
| C2255 | Developing motor failure to turn | B | - |
| C2256 | Developing motor turning at abnormal timing | B | - |
| C2355 | Transfer belt cleaner cooling fan failure to turn | B | - |
| C2411 | Developing unit/C new article release | B | - |
| C2412 | Developing unit/M new article release | B | - |
| C2413 | Developing unit/Y new article release | B | - |
| C2414 | Developing unit/K new article release | B | - |
| C2551 | Abnormally low toner density detected cyan TCR sensor | B | - |
| C2552 | Abnormally high toner density detected cyan TCR sensor | B | - |
| C2553 | Abnormally low toner density detected magenta TCR sensor | B | - |
| C2554 | Abnormally high toner density detected magenta TCR sensor | B | - |
| C2555 | Abnormally low toner density detected yellow TCR sensor | B | - |
| C2556 | Abnormally high toner density detected yellow TCR sensor | B | - |
| C2557 | Abnormally low toner density detected black TCR sensor | B | - |
| C2558 | Abnormally high toner density detected black TCR sensor | B | - |
| C2559 | Cyan TCR sensor adjustment failure | B | - |
| C255A | Magenta TCR sensor adjustment failure | B | - |
| C255B | Yellow TCR sensor adjustment failure | B | - |
| C255C | Black TCR sensor adjustment failure | B | - |
| C2561 | Cyan TCR sensor failure | B | - |
| C2562 | Magenta TCR sensor failure | B | - |
| C2563 | Yellow TCR sensor failure | B | - |
| C2564 | Black TCR sensor failure | B | - |
| C2650 | Main backup media access error | C | - |
| C2A11 | Drum unit/C new release failure | B | - |
| C2A12 | Drum unit/M new release failure | B | - |
| C2A13 | Drum unit/Y new release failure | B | - |
| C2A14 | Drum unit/K new release failure | B | - |
| C2A21 | Toner cartridge/C new release failure | C | - |
| C2A22 | Toner cartridge/M new release failure | C | - |
| C2A23 | Toner cartridge/Y new release failure | C | - |
| C2A24 | Toner cartridge/K new release failure | C | - |
| C3101 | Pressure roller pressure failure | B | - |
| C3103 | Pressure roller release failure | B | - |

### 3.6 List of the trouble code (bizhub C658/C558/C458)

| Code | Item | Rank | Self-diag. (Full) |
| :---: | :--- | :---: | :---: |
| C0002 | Paper feed communication error | C | - |
| C0106 | Tray 3/transfer LCT paper feed motor's turning at abnormal timing (When <br> PC-115, PC-215, or PC-415 is installed) | B | - |
| C0107 | Tray 3/transfer LCT vertical transport motor's turning at abnormal timing <br> (When PC-115, PC-215, or PC-415 is installed) | B | - |
| C0108 | Tray 4 paper feed motor's turning at abnormal timing (When PC-215 is <br> installed) | B | - |

| Code | Item | Rank | Self-diag. (Full) |
| :---: | :---: | :---: | :---: |
| C0109 | Tray 4 vertical transport motor's turning at abnormal timing (When PC-215 is installed) | B | - |
| C0202 | Tray 1 feeder up/down abnormality | B | - |
| C0204 | Tray 2 feeder up/down abnormality | B | - |
| C0206 | Tray 3 feeder up/down abnormality (When PC-115 or PC-215 is installed) | B | - |
| C0208 | Tray 4 feeder up/down abnormality (When PC-215 is installed) | B | - |
| C0210 | Transfer LCT lift failure (When PC-415 is installed) | B | - |
| C0211 | Manual feed up/down abnormality | B | - |
| C0214 | Transfer LCT shift failure (When PC-415 is installed) | B | - |
| C0216 | External LCT up/down abnormality (When LU-207 or LU-302 is installed) | B | - |
| C1003 | PK communication error (Finisher detection) (When FS-537+PK-523 or FS-537SD+PK-523 is installed) | C | - |
| C1004 | Finisher communication error (Engine detection) (When FS-533, FS-536, FS-536SD, FS-537, FS-537SD, or JS-506 is installed) | C | - |
| C1007 | PI communication error (Finisher detection) (When FS-537+PI-507 or FS-537SD+PI-507 is installed) | C | - |
| C1013 | PK communication error (PK detection) (When FS-537+PK-523 or FS-537SD+PK-523 is installed) | C | - |
| C1014 | Finisher communication error (Finisher detection) (When FS-536, FS-536SD, FS-537, or FS-537SD is installed) | C | - |
| C1017 | PI communication error (PI detection) (When FS-537+PI-507 or FS-537SD+PI-507 is installed) | C | - |
| C1081 | SD communication error (Finisher detection) (When FS-536SD or FS-537SD is installed) | C | - |
| C1082 | SD communication error (SD detection) (When FS-536SD or FS-537SD is installed) | C | - |
| C1102 | Main tray up/down motor's drive malfunction (When FS-533, FS-536, FS-536SD, FS-537, or FS-537SD is installed) | B | - |
| C1103 | Alignment motor/front's drive malfunction (When FS-533, FS-536, FS-536SD, FS-537, or FS-537SD is installed) | B | - |
| C1104 | Stacker plate drive motor's malfunction (When FS-537 or FS-537SD is installed) | B | - |
| C1105 | Bundle eject motor's drive malfunction (When FS-536, FS-536SD, FS-537, or FS-537SD is installed) | B | - |
| C1106 | Stapler movement motor's drive malfunction (When FS-533, FS-536, FS-536SD, FS-537, or FS-537SD is installed) | B | - |
| C1109 | Side stapler motor's drive malfunction (When FS-533, FS-536, FS-536SD, FS-537, or FS-537SD is installed) | B | - |
| C1112 | Stapler motor's malfunction (When FS-536SD or FS-537SD is installed) | B | - |
| C1113 | Stopper drive motor's malfunction (When FS-536SD or FS-537SD is installed) | B | - |
| C1114 | Alignment motor's drive malfunction (When FS-536SD or FS-537SD is installed) | B | - |
| C1115 | Center fold knife motor's malfunction (When FS-536SD or FS-537SD is installed) | B | - |
| C1124 | Tray lift motor /Lw's drive malfunction (When FS-537+PI-507 or FS-537SD+PI-507 is installed) | B | - |
| C1125 | Tray lift motor /Up's drive malfunction (When FS-537+PI-507 or FS-537SD+PI-507 is installed) | B | - |
| C1127 | Punch oscillating motor's drive malfunction (When FS-537+PK-523 or FS-537SD+PK-523 is installed) | B | - |
| C1130 | ZU transport motor's drive malfunction (When FS-537+ZU-609 or FS-537SD+ZU-609 is installed) | B | - |
| C1131 | Folding guide motor's drive malfunction (When FS-537+ZU-609 or FS-537SD+ZU-609 is installed) | B | - |
| C1132 | Punch drive motor's malfunction (When FS-533+PK-519, FS-536+PK-520, FS-536SD+PK-520, FS-537+PK-523, or FS-537SD +PK-523 is installed) | B | - |
| C1133 | Pressure motor's drive malfunction (When FS-537+ZU-609 or FS-537SD $+Z U-609$ is installed) | B | - |
| C1140 | Alignment motor/rear's drive malfunction (When FS-533, FS-536, FS-536SD, FS-537, or FS-537SD is installed) | B | - |
| C1141 | FNS paddle motor's drive malfunction (When FS-536, FS-536SD, FS-537, or FS-537SD is installed) | B | - |

| Code | Item | Rank | Self-diag. (Full) |
| :---: | :---: | :---: | :---: |
| C1142 | Paddle up/down motor's drive malfunction (When FS-537 or FS-537SD is installed) | B | - |
| C1143 | Arm drive motor's drive malfunction (When FS-537 or FS-537SD is installed) | B | - |
| C1144 | Pre-eject drive motor's drive malfunction (When FS-536, FS-536SD, FS-537, or FS-537SD is installed) | B | - |
| C1145 | Trail edge stopper motor's drive malfunction (When FS-536, FS-536SD, FS-537, or FS-537SD is installed) | B | - |
| C1146 | Trail edge stopper motor/R's drive malfunction (When FS-537 or FS-537SD is installed) | B | - |
| C1152 | Paper transport belt motor's malfunction (When FS-537SD is installed) | B | - |
| C1156 | SD paddle motor's malfunction (When FS-536SD or FS-537SD is installed) | B | - |
| C1182 | Shift motor's drive malfunction (When JS-506 is installed) | B | - |
| C1184 | Paper receiving control motor's drive malfunction (When FS-536, FS-536SD, FS-537, or FS-537SD is installed) | B | - |
| C1195 | Paper discharge control motor's malfunction (When FS-536SD or FS-537SD is installed) | B | - |
| C1196 | Center fold guide motor's malfunction (When FS-536SD or FS-537SD is installed) | B | - |
| C1197 | Tri-folding guide motor's malfunction (When FS-536SD or FS-537SD is installed) | B | - |
| C11A1 | Exit roller pressure/ retraction malfunction (When FS-533 is installed) | B | - |
| C11A2 | Receiving roller retraction motor's drive malfunction (When FS-536, FS-536SD, FS-537, or FS-537SD is installed) | B | - |
| C11C5 | Paper size detect board malfunction (When FS-537+PK-523 or FS-537SD +PK-523 is installed) | B | - |
| C11E1 | Paper exit switching drive malfunction (When FS-536, FS-536SD, FS-537, or FS-537SD is installed) | B | - |
| C11E2 | Paper exit switching (JS) drive malfunction | B | - |
| C1402 | FS nonvolatile memory error (When FS-533 is installed) | C | - |
| C1403 | PK flash ROM error (When FS-537+PK-523 or FS-537SD+PK-523 is installed) | C | - |
| C1404 | PI flash ROM error (When FS-537+PI-507 or FS-537SD+PI-507 is installed) | C | - |
| C2152 | Transfer belt fault at initial position return | B | - |
| C2153 | Transfer belt spacing fault at K pressure switching | B | - |
| C2154 | Transfer belt contact fault at all pressure switching | B | - |
| C2155 | Transfer belt contact fault after K pressure established | B | - |
| C2156 | Transfer belt spacing fault after all pressure established | B | - |
| C2253 | PC motor's failure to turn | B | - |
| C2254 | PC motor's turning at abnormal timing | B | - |
| C2255 | Developing motor's failure to turn | B | - |
| C2256 | Developing motor's turning at abnormal timing | B | - |
| C2350 | Toner suction fan's failure to turn | B | - |
| C2355 | Transfer belt cleaner cooling fan's failure to turn | B | - |

### 3.7 C0\#\#\# (bizhub C368/C308/C258)

### 3.7.1 C0002 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | C0002: Paper feed communication error |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | When the MFP board (MFPB) is receiving data, a communication error is detected. |

| Trouble isolation | - |
| :--- | :--- |
| Relevant electrical parts | • MFP board (MFPB) |

## (2) Procedure

1. Turn OFF the main power switch, disconnect and then connect the power cord. Wait for 10 sec . or more after connect the power cord, and turn ON the main power switch.
2. Correct or replace the harness connection between the main body and the paper feed cabinet if faulty
3. Rewrite the firmware.
4. Replace PCCB. (PC-110/PC-210 / PC-410)
5. Replace MFPB.

### 3.7.2 C0106 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | C0106: Tray 3/transfer LCT paper feed motor turning at abnormal timing (When PC-110, PC-210 or PC-410 is installed) |
| :---: | :---: |
| Rank | B |
| Trouble detection condition | - The motor lock signal remains HIGH for a predetermined continuous period of time while the motor is turning. <br> - The motor lock signal remains LOW for a predetermined continuous period of time while the motor remains stationary. |
| Trouble isolation | - |
| Relevant electrical parts | <When PC-110 or PC-210 is installed> <br> - Tray 3 paper feed motor (M111) <br> - PC control board (PCCB) |
|  | <When PC-410 is installed> <br> - Paper feed motor (M131) <br> - PC control board (PCCB) |

## (2) Procedure

(a) When PC-110 or PC-210 is installed

1. Check the connector between M111-PCCB CN5 for proper connection and correct as necessary.
2. Check the connector of M111 for proper drive coupling and correct as necessary.
3. M111 operation check

- Control signal: PCCB CN5-5 (CW/CCW)
- Location of electrical component: PC-110/PC-210 4-C

4. Replace M111.
5. Replace PCCB.

NOTICE

- Link to the wiring diagram ( N.4.3 PC-110)
- Link to the wiring diagram ( N.4.5 PC-210)
(b) When PC-410 is installed

1. Check the connector between M131-PCCB CN5 for proper connection and correct as necessary.
2. Check the connector of M131 for proper drive coupling and correct as necessary.
3. M131 operation check

- Control signal: PCCB CN5-5 (CW/CCW)
- Location of electrical component: PC-410 4-J

4. Replace M131.
5. Replace PCCB.

NOTICE

- Link to the wiring diagram ( N.4.7 PC-410)

### 3.7.3 C0107 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | C0107: Tray 3/transfer LCT vertical transport motor turning at abnormal timing (When PC-110, PC-210 or PC-410 is installed) |
| :---: | :---: |
| Rank | B |
| Trouble detection condition | - The motor lock signal remains HIGH for a predetermined continuous period of time while the motor is turning. <br> - The motor lock signal remains LOW for a predetermined continuous period of time while the motor remains stationary. |
| Trouble isolation | - |
| Relevant electrical parts | <When PC-110 or PC-210 is installed> <br> - Tray 3 vertical transport motor (M112) <br> - PC control board (PCCB) |
|  | <When PC-410 is installed> <br> - Vertical transport motor (M132) <br> - PC control board (PCCB) |

## (2) Procedure

(a) When PC-110 or PC-210 is installed

1. Check the connector between M112-PCCB CN5 for proper connection and correct as necessary.
2. Check the connector of M112 for proper drive coupling and correct as necessary.
3. M112 operation check

- Control signal: PCCB CN5-13 (CW/CCW)
- Location of electrical component: PC-110/PC-210 3 to 4-C

4. Replace M112.
5. Replace PCCB.

NOTICE

- Link to the wiring diagram ( N.4.3 PC-110)
- Link to the wiring diagram ( N.4.5 PC-210)
(b) When PC-410 is installed

1. Check the connector between M132-PCCB CN5 for proper connection and correct as necessary.
2. Check the connector of M132 for proper drive coupling and correct as necessary.
3. M132 operation check

- Control signal: PCCB CN5-13 (CW/CCW)
- Location of electrical component: PC-410 4-J

4. Replace M132.
5. Replace PCCB.

NOTICE

- Link to the wiring diagram ( N.4.7 PC-410)

### 3.7.4 C0108 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | C0108: Tray 4 paper feed motor turning at abnormal timing (When PC-210 is installed) |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | • The motor lock signal remains HIGH for a predetermined continuous period of time while the motor is <br> turning. |
| The motor lock signal remains LOW for a predetermined continuous period of time while the motor remains |  |
| stationary. |  |

## (2) Procedure

1. Check the connector between M121-PCCB CN9 for proper connection and correct as necessary.
2. Check the connector of M121 for proper drive coupling and correct as necessary.
3. M121 operation check

- Control signal: PCCB CN9-5 (CW/CCW)
- Location of electrical component: PC-210 6-K

4. Replace M121.
5. Replace PCCB.

NOTICE

- Link to the wiring diagram ( N.4.5 PC-210)

### 3.7.5 C0109 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | C0109: Tray 4 vertical transport motor turning at abnormal timing (When PC-210 is installed) |
| :---: | :---: |
| Rank | B |
| Trouble detection condition | - The motor lock signal remains HIGH for a predetermined continuous period of time while the motor is turning. <br> - The motor lock signal remains LOW for a predetermined continuous period of time while the motor remains stationary. |
| Trouble isolation | - ${ }^{\text {d }}$ |
| Relevant electrical parts | - Tray 4 vertical transport motor (M122) <br> - PC control board (PCCB) |

## (2) Procedure

1. Check the connector between M122-PCCB CN9 for proper connection and correct as necessary.

Check the connector of M122 for proper drive coupling and correct as necessary.
M122 operation check

- Control signal: PCCB CN9-13 (CW/CCW)
- Location of electrical component: PC-210 6-K

4. Replace M122.
5. Replace PCCB.

## NOTICE

- Link to the wiring diagram ( N.4.5 PC-210)

### 3.7.6 C0202 (bizhub C368/C308/C258)

## (1) Contents

| Trouble type | C0202: Tray 1 feeder up/down abnormality |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | The tray 1 upper limit sensor (PS25) is not turned ON (blocked) even after the set period of time has elapsed <br> after the paper lift-up operation for the drawer began. |
| Trouble isolation | Tray 1 |
| Relevant electrical parts | • Tray 1 lift-up motor (M12) <br> • Tray 1 upper limit sensor (PS25) <br> - MFP board (MFPB) |

## (2) Procedure

1. Remove the tray and check to see if a piece of paper is not left inside the machine.
2. Check the connector between M12-MFPB CN19E for proper connection and correct as necessary.
3. Check the connector of M12 for proper drive coupling and correct as necessary.
4. Check the connector between PS25-relay CN30-MFPB CN26E for proper connection and correct as necessary.
5. PS25 I/O check, sensor check

- Control signal: MFPB CN26E-3 (ON)
- Location of electrical component: 25-C

6. M12 operation check

- Control signal: MFPB CN19E-5 (REM)
- Location of electrical component: 21-C

7. Replace M12.
8. Replace MFPB.
notice

- Link to the wiring diagram ( N. 1 bizhub C368/C308/C258)

### 3.7.7 C0204 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | C0204: Tray 2 feeder up/down abnormality |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | The tray 2 upper limit sensor (PS22) is not turned ON (blocked) even after the set period of time has elapsed <br> after the paper lift-up operation for the drawer began. |
| Trouble isolation | Tray 2 |
| Relevant electrical parts | - Tray 2 lift-up motor (M13) <br> - Tray 2 upper limit sensor (PS22) <br> - MFP board (MFPB) |

## (2) Procedure

1. Remove the tray and check to see if a piece of paper is not left inside the machine.
2. Check the connector between M13-MFPB CN25E for proper connection and correct as necessary
3. Check the connector of M13 for proper drive coupling and correct as necessary.
4. Check the connector between PS22-relay CN40-MFPB CN23E for proper connection and correct as necessary.
5. PS22 I/O check, sensor check

- Control signal: MFPB CN23E-9 (ON)
- Location of electrical component: 27-C

6. M13 operation check

- Control signal: MFPB CN25E-5 (REM)
- Location of electrical component: 22-C

7. Replace M13.
8. Replace MFPB.

## NOTICE

- Link to the wiring diagram ( N. 1 bizhub C368/C308/C258)

### 3.7.8 C0206 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | C0206: Tray 3 feeder up/down abnormality (When PC-110 or PC-210 is installed) |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | The tray 3 upper limit sensor (PS116) is not turned ON (blocked) even after the set period of time has elapsed <br> after the paper lift-up operation for the drawer began. |
| Trouble isolation | Tray 3 |
| Relevant electrical parts | - Tray 3 lift-up motor (M113) <br> - Tray 3 upper limit sensor (PS116) <br> - PC control board (PCCB) <br> - MFP board (MFPB) |

## (2) Procedure

1. Remove the tray and check to see if a piece of paper is not left inside the machine.
2. Check the connector between M113-PCCB CN6 for proper connection and correct as necessary.
3. Check the connector of M113 for proper drive coupling and correct as necessary.
4. Check the connector between PS116-relay CN24-PCCB CN4 for proper connection and correct as necessary.
5. PS116 I/O check, sensor check

- Control signal: PCCB CN4-3 (ON)
- Location of electrical component: PC-110/PC-210 7-C

6. M113 operation check

- Control signal: PCCB CN6-8 to 9
- Location of electrical component: PC-110/PC-210 2-C

7. Replace M113.
8. Replace PCCB.
9. Replace MFPB.

### 3.8 C0\#\#\# (bizhub C658/C558/C458)

### 3.8.1 C0002 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | C0002: Paper feed communication error |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | When the MFP board (MFPB) is receiving data, a communication error is detected. |
| Trouble isolation | - |
| Relevant electrical parts | • MFP board (MFPB) |

## (2) Procedure

1. Turn OFF the main power switch, disconnect and then connect the power cord. Wait for 10 sec . or more after connect the power cord, and turn ON the main power switch.
2. Correct or replace the harness connection between the main body and the paper feed cabinet if faulty.
3. Rewrite the firmware.
4. Replace PCCB. (PC-115/PC-215 / PC-415)
5. Replace MFPB.

### 3.8.2 C0106 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | C0106: Tray 3/transfer LCT paper feed motor's turning at abnormal timing (When PC-115, PC-215, or PC-415 is <br> installed) |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | - The motor lock signal remains HIGH for a predetermined continuous period of time while the motor is <br> turning. <br> The motor lock signal remains LOW for a predetermined continuous period of time while the motor remains <br> stationary. |
| Trouble isolation | $-\quad$. |

| Relevant electrical parts | <When PC-115 or PC-215 is installed> <br> • Tray 3 paper feed motor (M111) <br> - PC control board (PCCB) |
| :--- | :--- |
|  | <When PC-415 is installed> <br> - Paper feed motor (M131) <br> - PC control board (PCCB) |

## (2) Procedure

## (a) When PC-115 or PC-215 is installed

1. Check the connector between M111-PCCB CN5 for proper connection and correct as necessary.
2. Check the connector of M111 for proper drive coupling and correct as necessary.
3. M111 operation check

- Control signal: PCCB CN5-5 (CW/CCW)
- Location of electrical component: PC-115/PC-215 4-C

4. Replace M111.
5. Replace PCCB.

NOTICE

- Link to the wiring diagram ( N.4.4 PC-115)
- Link to the wiring diagram ( N.4.6 PC-215)
(b) When PC-415 is installed

1. Check the connector between M131-PCCB CN5 for proper connection and correct as necessary.
2. Check the connector of M131 for proper drive coupling and correct as necessary.
3. M131 operation check

- Control signal: PCCB CN5-5 (CW/CCW)
- Location of electrical component: PC-415 4-J

4. Replace M131.
5. Replace PCCB.

NOTICE

- Link to the wiring diagram ( N.4.8 PC-415)

(b) When PC-415 is installed

1. Check the connector between M132-PCCB CN5 for proper connection and correct as necessary.
2. Check the connector of M132 for proper drive coupling and correct as necessary.
3. M132 operation check

- Control signal: PCCB CN5-13 (CW/CCW)
- Location of electrical component: PC-415 4-J

4. Replace M132.
5. Replace PCCB.

NOTICE

- Link to the wiring diagram ( N.4.8 PC-415)

### 3.8.4 C0108 (bizhub C658/C558/C458)

## (1) Contents

| Trouble type | C0108: Tray 4 paper feed motor's turning at abnormal timing (When PC-215 is installed) |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | • The motor lock signal remains HIGH for a predetermined continuous period of time while the motor is <br> - turning. <br> The motor lock signal remains LOW for a predetermined continuous period of time while the motor remains <br> stationary. |
| Trouble isolation | - |
| Relevant electrical parts | - Tray 4 paper feed motor (M121) <br> - PC control board (PCCB) |

## (2) Procedure

1. Check the connector between M121-PCCB CN9C for proper connection and correct as necessary.
2. Check the connector of M121 for proper drive coupling and correct as necessary.
3. M121 operation check

- Control signal: PCCB CN9C-5 (CW/CCW)
- Location of electrical component: PC-215 6-K

Replace M121.
5. Replace PCCB.

NOTICE

- Link to the wiring diagram ( N.4.6 PC-215)

### 3.8.5 C0109 (bizhub C658/C558/C458)

## (1) Contents

| Trouble type | C0109: Tray 4 vertical transport motor's turning at abnormal timing (When PC-215 is installed) |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | • The motor lock signal remains HIGH for a predetermined continuous period of time while the motor is <br> turning. |
|  | The motor lock signal remains LOW for a predetermined continuous period of time while the motor remains <br> stationary. |
| Trouble isolation | $-\quad$- Tray 4 vertical transport motor (M122) <br> Relevant electrical parts |

## (2) Procedure

1. Check the connector between M122-PCCB CN9C for proper connection and correct as necessary.
2. Check the connector of M122 for proper drive coupling and correct as necessary.
3. M122 operation check

- Control signal: PCCB CN9C-13 (CW/CCW)
- Location of electrical component: PC-215 6-K

Replace M122.
5. Replace PCCB.

| :--- | :--- | :--- | :--- |
| Trouble isolation | Manual |
| Relevant electrical parts | - Transport motor (M1) <br> - Bypass pick-up solenoid (SD1) <br> - Bypass lift-up position sensor (PS26) <br> - MFP board (MFPB) |

## (2) Procedure

1. Check the connector between M1-MFPB CN14E for proper connection and correct as necessary.
2. Check the connector of M1 for proper drive coupling and correct as necessary.
3. Check the connector between PS26-relay CN19-MFPB CN19E for proper connection and correct as necessary.
4. Check the connector between SD1-relay CN21-relay CN19-MFPB CN19E for proper connection and correct as necessary

PS26 I/O check, sensor check

- Control signal: MFPB CN19E-13 (ON)
- Location of electrical component: 22-J

6. SD1 operation check

- Control signal: MFPB CN19E-9 (SD1_24V)
- Location of electrical component: 22-J

7. M1 operation check

- Control signal: MFPB CN41E-3 (REM), MFPB CN14E-6 (LOCK)
- Location of electrical component: 1-C

8. Replace M1.
9. MFPB ICP3E conduction check
10. Replace MFPB.

### 3.8.12 C0214 (bizhub C658/C558/C458)

## (1) Contents

| Trouble type | C0214: Transfer LCT shift failure (When PC-415 is installed) |
| :---: | :---: |
| Rank | B |
| Trouble detection condition | - The shifter stop / lower limit position sensor (PS138) is not turned ON (blocked) even after the set period of time has elapsed after the shift operation began (shift to the right). <br> - The shifter home sensor (PS139) is not turned OFF (unblocked) even after the set period of time has elapsed after the shift operation began (shift to the right). <br> - The shifter stop / lower limit position sensor (PS138) is not turned OFF (unblocked) even after the set period of time has elapsed after the return operation began (shift to the left). <br> - The shifter home sensor (PS139) is not turned ON (blocked) even after the set period of time has elapsed after the return operation began (shift to the left). |
| Trouble isolation | LCT |
| Relevant electrical parts | - Shifter stop / lower limit position sensor (PS138) <br> - Shifter home sensor (PS139) <br> - Shifter motor (M133) <br> - PC control board (PCCB) |

## (2) Procedure

1. Remove thetray and check to see if a piece of paper is not left inside the machine.
2. Check the connector between M133-PCCB CN10L for proper connection and correct as necessary.
3. Check the connector of M133 for proper drive coupling and correct as necessary.
4. Check the connector between PS138-relay CN16-PCCB CN14L for proper connection and correct as necessary.
5. Check the connector between PS139-relay CN16-PCCB CN14L for proper connection and correct as necessary.
6. PS138 I/O check, sensor check

- Control signal: PCCB CN14L-6 (ON)
- Location of electrical component: PC-415 3-J

7. PS139 I/O check, sensor check

- Control signal: PCCB CN14L-3 (ON)
- Location of electrical component: PC-415 4-J

8. M133 operation check

- Control signal: PCCB CN10L-3 to 4
- Location of electrical component: PC-415 5-J

9. Replace M133.
10. Replace PCCB.

## (2) Procedure

## (a) When FS-533 is installed

1. Check the connector between M109-FSCB CN108 for proper connection and correct as necessary.
. Check the connector of M109 for proper drive coupling, and correct as necessary.
. Check the connector between PS107-FSCB CN110 for proper connection and correct as necessary.
. PS107 I/O check, sensor check

- Control signal: FSCB CN110
- Location of electrical component: FS-533 7-D to E

5. M109 operation check

- Control signal: FSCB CN108
- Location of electrical component: FS-533 10-E

6. Replace M109.
7. FSCB CP109 conduction check

Replace FSCB.
NOTICE

- Link to the wiring diagram ( N.4.11 FS-533)
(b) When FS-534 or FS-534SD is installed
. Check the motor, sensor and switch connectors for proper connection, and correct as necessary.
. Check the connector of M11 for proper drive coupling, and correct as necessary.

3. PS26 I/O check, sensor check

- Control signal: FSCB J14<A>-5 (ON)
- Location of electrical component: FS-534 2-C

4. PS27 I/O check, sensor check

- Control signal: FSCB J14<B>-6 (ON)
- Location of electrical component: FS-534 3-C

5. PS29 I/O check, sensor check

- Control signal: FSCB J14<A>-8 (ON)
- Location of electrical component: FS-534 4-C

6. SW2 operation check

- Control signal: FSCB J10-1 to 2
- Location of electrical component: FS-534 8-K

7. M11 operation check

- Control signal: FSCB J9<A>-9 to 10
- Location of electrical component: FS-534 10-C to D

8. Replace M11.
9. Replace FSCB.

NOTICE

| Trouble type | C1103: Alignment plate motor/Fr malfunction (When FS-533, FS-534 or FS-534SD is installed) |
| :--- | :--- |
| Rank | B |

| Trouble detection condition | <When FS-533 is installed> <br> - The alignment plate home sensor/F (PS108) is not turned OFF (unblocked) after the set period of time has elapsed after the plate drive starts from the home position. <br> - The alignment plate home sensor/F (PS108) is not turned ON (blocked) after the set period of time has elapsed after the alignment motor/F (M105) is turned ON to return the plate to the home position. |
| :---: | :---: |
|  | <When FS-534 or FS-534SD is installed> <br> - The alignment plate/F home sensor (PS12) is not turned OFF (unblocked) after the set period of time has elapsed after the plate drive starts from the home position. <br> - The alignment plate/F home sensor (PS12) is not turned ON (blocked) after the set period of time has elapsed after the alignment motor/Front (M7) is turned ON to return the plate to the home position. <br> - The alignment plate/F does not reach the specified position within the set period of time. |
| Trouble isolation | - |
| Relevant electrical parts | <When FS-533 is installed> <br> - Alignment motor/F (M105) <br> - Alignment plate home sensor/F (PS108) <br> - FS control board (FSCB) |
|  | <When FS-534 or FS-534SD is installed> <br> - Alignment motor/Front (M7) <br> - Alignment plate/F home sensor (PS12) <br> - FS control board (FSCB) |

## (2) Procedure

(a) When FS-533 is installed

1. Check the connector between M105-FSCB CN102 for proper connection and correct as necessary.
2. Check the connector of M105 for proper drive coupling, and correct as necessary.
3. Check the connector between PS108-FSCB CN102 for proper connection and correct as necessary.
4. PS108 I/O check, sensor check

- Control signal: FSCB CN102
- Location of electrical component: FS-533 7-J

5. M105 operation check

- Control signal: FSCB CN102
- Location of electrical component: FS-533 7-J

6. Replace M105.
7. FSCB CP105 conduction check
8. Replace FSCB.

NOTICE

- Link to the wiring diagram ( N.4.11 FS-533)
(b) When FS-534 or FS-534SD is installed

1. Check the connector between M7-FSCB J4 for proper connection and correct as necessary.
2. Check the connector of M7 for proper drive coupling and correct as necessary.
3. Check the connector between PS12-FSCB J4 for proper connection and correct as necessary.
4. PS12 I/O check, sensor check

- Control signal: FSCB J4<B>-4 (ON)
- Location of electrical component: FS-534 13-C

5. M7 operation check

- Control signal: FSCB J4<A>-5 to 8
- Location of electrical component: FS-534 11-C to D

6. Replace M7.
7. Replace FSCB.

NOTICE

| Trouble detection condition | - The gripper home position sensor (PS18) is not turned ON (blocked) even after the set period of time has elapsed after the gripper position detection sensor (PS19) is turned OFF (unblocked). <br> - The gripper position detection sensor (PS19) is not turned OFF (unblocked) even after the set period of time has elapsed after it is turned ON (blocked). <br> - The gripper position detection sensor (PS19) is not turned ON (blocked) even after the set period of time has elapsed after the gripper home position sensor (PS18) is turned OFF (unblocked). <br> - The gripper home position sensor (PS18) is not turned OFF (unblocked) even after the set period of time has elapsed after the bundle eject motor (M10) is energized. <br> - The gripper home position sensor (PS18) and the gripper position detection sensor (PS19) is turned ON (blocked) at the same time. |
| Trouble isolation | - |
| Relevant electrical parts | - Bundle eject motor (M10) <br> - Gripper home position sensor (PS18) <br> - Gripper position detection sensor (PS19) <br> - FS control board (FSCB) |

## (2) Procedure

1. Check the motor and sensor connectors for proper connection, and correct as necessary.
2. Check the connector of M 10 for proper drive coupling, and correct as necessary.
3. PS18 I/O check, sensor check

- Control signal: FSCB J13-13 (ON)
- Location of electrical component: FS-534 7-C

4. PS19 I/O check, sensor check

- Control signal: FSCB J12-3 (ON)
- Location of electrical component: FS-534 7-C

5. M10 operation check

- Control signal: FSCB J13-1 to 2
- Location of electrical component: FS-534 8-C to D

6. Replace M10.
7. Replace FSCB.

NOTICE

- Link to the wiring diagram ( N.4.12 FS-534)

### 3.9.6 C1106 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | C1106: Stapler movement motor malfunction (When FS-533, FS-534 or FS-534SD is installed) |
| :---: | :---: |
| Rank | B |
| Trouble detection condition | <When FS-533 is installed> <br> - The stapler home sensor (PS110) is not turned OFF (unblocked) after the laps of given time after it started operating from the home position. <br> - The stapler home sensor (PS110) is not turned ON (blocked) after the laps of give time after the stapler movement motor (M107) turned ON when it returned to the home position. |
|  | <When FS-534 or FS-534SD is installed> <br> - The stapler home position sensor (Rear) (PS23) is not turned ON (blocked) or OFF (unblocked) even after the set period of time has elapsed after the side stapler movement motor (M13) turned ON. <br> - The stapler does not reach the specified position within the set period of time. |
| Trouble isolation | Staple |
| Relevant electrical parts | <When FS-533 is installed> <br> - Stapler movement motor (M107) <br> - Stapler home sensor (PS110) <br> - Stapler relay board (STREYB) <br> - FS control board (FSCB) |
|  | <When FS-534 or FS-534SD is installed> <br> - Side stapler movement motor (M13) <br> - Stapler home position sensor (Rear) (PS23) <br> - FS control board (FSCB) |

## (2) Procedure

(a) When FS-533 is installed
. Check the connector between M107-STREYB CN123 for proper connection, and correct as necessary.
Check the connector of M107 for proper drive coupling, and correct as necessary.
Check the connector between PS110-FSCB CN110 for proper connection, and correct as necessary.
4. PS110 I/O check, sensor check

- Control signal: FSCB CN110
- Location of electrical component: FS-533 8-D to E

5. M107 operation check

- Control signal: STREYB CN123-5 to 8
- Location of electrical component: FS-533 5-L

6. Replace M107.
7. Replace STREYB.
. FSCB CP107 conduction check
8. Replace FSCB.

NOTICE

- Link to the wiring diagram ( N.4.11 FS-533)
(b) When FS-534 or FS-534SD is installed

1. Check the connector between M13-relay CN3-FSCB J11 for proper connection, and correct as necessary.
. Check the connector of M13 for proper drive coupling and correct as necessary.
. Check the connector between PS23-relay CN3-FSCB J11 for proper connection, and correct as necessary.
. PS23 I/O check, sensor check

- Control signal: FSCB J11<B>-3 (ON)
- Location of electrical component: FS-534 4-C

5. M13 operation check

- Control signal: FSCB J11<A>-1 to 4
- Location of electrical component: FS-534 4-C to D

6. Replace M13.
7. Replace FSCB.

NOTICE

- Link to the wiring diagram ( N.4.12 FS-534)

### 3.9.7 C1109 (bizhub C368/C308/C258)

## (1) Contents

| Trouble type | C1109: Stapler motor drive malfunction (When FS-533, FS-534 or FS-534SD is installed) |
| :---: | :---: |
| Rank | B |
| Trouble detection condition | <When FS-533 is installed> <br> - The stapler home sensor (PS110) is not turned ON (blocked) even after the set period of time has elapsed after the stapler motor turned ON. |
|  | <When FS-534 or FS-534SD is installed> <br> - The stapler home position sensor (Rear) (PS23) is not turned ON (blocked) or OFF (unblocked) even after the set period of time has elapsed after the stapler motor (M14) turned ON. <br> - The stapler position sensor (Center) (PS24) is turned ON (blocked), when the stapler motor (M14) is running. |
| Trouble isolation | Staple |
| Relevant electrical parts | <When FS-533 is installed> <br> - Stapler home sensor (PS110) <br> - Stapler unit <br> - Stapler relay board (STREYB) <br> - FS control board (FSCB) |

## (2) Procedure

(a) When FS-533 is installed

1. Check the connector between the stapler unit-STREYB CN122 and CN123 for proper connection and correct as necessary.
2. Check the connector of the stapler unit for proper drive coupling and correct as necessary.
3. Check the connector between PS110-FSCB CN110 for proper connection and correct as necessary.
4. PS110 I/O check, sensor check

- Control signal: FSCB CN110
- Location of electrical component: FS-533 8-D to E

5. Replace the stapler unit.
6. Replace STREYB.
7. Replace FSCB.

NOTICE

- Link to the wiring diagram ( N.4.11 FS-533)
(b) When FS-534 or FS-534SD is installed

1. Check the connector between the stapler unit-relay CN4-FSCB J11 for proper connection and correct as necessary.
2. Check the connector of the stapler unit for proper drive coupling and correct as necessary.
3. Check the connector between PS23-relay CN3-FSCB J11 for proper connection, and correct as necessary.
4. Check the connector between PS24-relay CN3-FSCB J11 for proper connection and correct as necessary.
5. PS23 I/O check, sensor check

- Control signal: FSCB J11<B>-3 (ON)
- Location of electrical component: FS-534 4-C

6. PS24 I/O check, sensor check

- Control signal: FSCB J11<B>-6 (ON)
- Location of electrical component: FS-534 4 to 5-C

7. Replace the stapler unit.
8. Replace FSCB.

NOTICE

| :--- | :--- |
| Rank | B |
| Trouble detection condition | The center fold knife home sensor (PS8) is not turned ON (blocked) or OFF (unblocked) even after the set <br> period of time has elapsed after the center fold knife motor (M9) is turned ON. |
| Trouble isolation | Center Stapling/Half-Fold/Tri-Fold |

| Relevant electrical parts | - Center fold knife motor (M9) |
| :--- | :--- |
|  | - Center fold knife home sensor (PS8) |
|  | - SD drive board (SDDB) |
|  | - FS control board (FSCB) |

## (2) Procedure

1. Check the connector between M9-SDDB J11 for proper connection and correct as necessary.
2. Check the connector of M9 for proper drive coupling and correct as necessary.
3. Check the connector between PS8-relay CN10-SDDB J7 for proper connection and correct as necessary.
4. PS8 I/O check, sensor check

- Control signal: SDDB J7-3 (ON)
- Location of electrical component: SD-511 6-G

5. M9 operation check

- Control signal: SDDB J11-11 to 20
- Location of electrical component: SD-511 1 to 2-B

6. Replace M9
7. Replace SDDB.
8. Replace FSCB.

| :---: | :---: |
| Rank | B |
| Trouble detection condition | <When FS-533+PK-519 is installed> <br> - The puncher drive cam sensor (PS203) or puncher home sensor (PS204) is not turned ON (blocked) or OFF (unblocked) even after the set period of time has elapsed while the punch motor (M201) is energized. <br> - The punch motor sensor (PS202) is not turned ON when the punch motor (M201) driven. <br> - The holes with other marketing area is set in [Service Mode] -> [Finisher] -> [Punch Option Setting]. |
|  | <When FS-534+PK-520 or FS-534SD+PK-520 is installed> <br> - The punch home sensor (PS1) is not turned ON (blocked) or OFF (unblocked) even after the set period of time has elapsed while the punch drive motor (M1) is energized. <br> - Thick paper is loaded and a punch operation is performed with [Plain Paper] left set for the paper type. |
| Trouble isolation | - |
| Relevant electrical parts | <When FS-533+PK-519 is installed> <br> - Punch motor (M201) <br> - Punch motor sensor (PS202) <br> - Puncher drive cam sensor (PS203) <br> - Puncher home sensor (PS204) <br> - PK control board (PKCB) <br> - FS control board (FSCB) |
|  | <When FS-534+PK-520 or FS-534SD+PK-520 is installed> <br> - Punch drive motor (M1) <br> - Punch home sensor (PS1) <br> - FS control board (FSCB) |

## (2) Procedure

(a) When FS-533+PK-519 is installed

Check the number of the holes in [Service Mode] -> [Finisher] -> [Punch Option Setting].
Check the connector between M201-PKCB CN203 for proper connection and correct as necessary.
Check the connector of M201 for proper drive coupling and correct as necessary.
Check the connector between PS202-PKCB CN204 for proper connection and correct as necessary.
Check the connector between PS203-PKCB CN204 for proper connection and correct as necessary.
Check the connector between PS204-PKCB CN204 for proper connection and correct as necessary.
PS202 I/O check, sensor check

- Control signal: PKCB CN204
- Location of electrical component: FS-533 (PK-519) 5-C

8. PS203 I/O check, sensor check

- Control signal: PKCB CN204
- Location of electrical component: FS-533 (PK-519) 6-C

9. PS204 I/O check, sensor check

- Control signal: PKCB CN204
- Location of electrical component: FS-533 (PK-519) 6-C

10. M201 operation check

- Control signal: PKCB CN203-1 to 2
- Location of electrical component: FS-533 (PK-519) 4-C

11. Replace M201.
12. PKCB F201 conduction check
13. Replace PKCB
14. Replace FSCB.

## NOTICE

- Link to the wiring diagram ( N.4.11 FS-533)
(b) When FS-534+PK-520 or FS-534SD+PK-520 is installed

1. Check that the correct paper type is set.

To print on thick paper, change the paper type to [Thick].
2. If the trouble occurs even when [Paper Type] is set to the correct paper type, select [Service Mode] -> [Security Settings] -> [Engine FW DipSW] and flip SW No. 17 to the ON NOTE

- Changing the setting of Engine FW DipSW results in a longer perforating time and greater punch perforating noise regardless of the paper type.

3. Check the connector between M1-relay CN351-FSCB J7 for proper connection and correct as necessary.
4. Check the connector of M1 for proper drive coupling and correct as necessary.
5. Check the connector between PS1-FSCB J7 for proper connection and correct as necessary.
6. PS1 I/O check, sensor check

- Control signal: FSCB J7-5 (ON)
- Location of electrical component: FS-534 (PK-520) 7-K

7. M1 operation check

- Control signal: FSCB J7-7 to 8
- Location of electrical component: FS-534 (PK-520) 7-K

8. Replace M1.
9. Replace FSCB.

NOTICE

- Link to the wiring diagram ( N.4.12 FS-534)

### 3.9.13 C1140 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | C1140: Alignment plate motor/Rr malfunction (When FS-533, FS-534 or FS-534SD is installed) |
| :---: | :---: |
| Rank | B |
| Trouble detection condition | <When FS-533 is installed> <br> - The alignment plate home sensor/R (PS109) is not turned OFF (unblocked) after the set period of time has elapsed after the plate drive starts from the home position. <br> - The alignment plate home sensor/R (PS109) is not turned ON (blocked) after the set period of time has elapsed while the alignment motor/R (M106) is energized when the plate returns to the home position. |
|  | <When FS-534 or FS-534SD is installed> <br> - The alignment plate/R home sensor (PS13) is not turned ON (blocked) or OFF (unblocked) even after the set period of time has elapsed while the alignment motor/Rear (M8) is energized. |
| Trouble isolation | - |
| Relevant electrical parts | <When FS-533 is installed> <br> - Alignment motor/R (M106) <br> - Alignment plate home sensor/R (PS109) <br> - FS control board (FSCB) |
|  | <When FS-534 or FS-534SD is installed> <br> - Alignment motor/Rear (M8) <br> - Alignment plate/R home sensor (PS13) <br> - FS control board (FSCB) |

## (2) Procedure

(a) When FS-533 is installed
. Check the connector between M106-FSCB CN102 for proper connection and correct as necessary.
Check the connector of M106 for proper drive coupling and correct as necessary.
Check the connector between PS109-FSCB CN102 for proper connection and correct as necessary.
. PS109 I/O check, sensor check

- Control signal: FSCB CN102
- Location of electrical component: FS-533 7-J

5. M106 operation check

- Control signal: FSCB CN102
- Location of electrical component: FS-533 8-J

6. Replace M106
7. FSCB CP105 conduction check
8. Replace FSCB

NOTICE

- Link to the wiring diagram ( N.4.11 FS-533)
(b) When FS-534 or FS-534SD is installed
. Check the connector between M8-FSCB J12 for proper connection and correct as necessary.
Check the connector of M8 for proper drive coupling and correct as necessary.
. Check the connector between PS13-FSCB J9 for proper connection and correct as necessary.

4. PS13 I/O check, sensor check

- Control signal: FSCB J9<B>-9 (ON)
- Location of electrical component: FS-534 9-C

5. M8 operation check

- Control signal: FSCB J12-13 to 16
- Location of electrical component: FS-534 5 to 6-C to D

6. Replace M8.
7. Replace FSCB.

NOTICE

### 3.9.25 C11E1 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | C11E1: Paper exit switching drive malfunction (When FS-534 or FS-534SD is installed) |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | The exchange folded knife home position sensor (PS30) is not turned ON (blocked) or OFF (unblocked) even <br> after the set period of time has elapsed after the FNS entry transport motor (M2) is turned ON. |
| Trouble isolation | - |
| Relevant electrical parts | - FNS entry transport motor (M2) <br> - Exchange folded knife home position sensor (PS30) <br> - FS control board (FSCB) |

## (2) Procedure

1. Check the connector between M2-FSCB J9 for proper connection and correct as necessary.
2. Check the connector of M2 for proper drive coupling and correct as necessary.
3. Check the connector between PS30-FSCB J4 for proper connection and correct as necessary.
4. PS30 I/O check, sensor check

- Control signal: FSCB J4<A>-15 (ON)
- Location of electrical component: FS-534 12-C

5. M2 operation check

- Control signal: FSCB J9<A>-1 to 4
- Location of electrical component: FS-534 10 to 11-B to C

6. Replace M2.
7. Replace FSCB.

NOTICE

- Link to the wiring diagram ( N.4.12 FS-534)

### 3.9.26 C1402 (bizhub C368/C308/C258)

## (1) Contents

| Trouble type | C1402: FS nonvolatile memory error (When FS-533 is installed) |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | When the main power switch is turned ON, malfunctioning of the nonvolatile memory on the FS control board <br> (FSCB) is detected. |
| Trouble isolation | - |
| Relevant electrical parts | FS control board (FSCB) |

## (2) Procedure

1. Turn OFF the main power switch, disconnect and then connect the power cord. Wait for 10 sec. or more after connect the power cord, and turn ON the main power switch.
2. Rewrite the firmware.
3. Replace FSCB.

### 3.10 C1\#\#\# (bizhub C658/C558/C458)

### 3.10.1 C1003, C1013 (bizhub C658/C558/C458)

## (1) Contents

| Trouble type | - C1003: PK communication error (Finisher detection) <br> - C1013: PK communication error (PK detection) |  |
| :--- | :--- | :--- |
| Rank | C |  |
| Trouble detection condition | $<$ When FS-537+PK-523 or <br> FS-537SD+PK-523 is installed $>$ | When a communication error is detected between the FS control board <br> (FSCB) and the punch control board (PKCB). |
| Trouble isolation | Punch |  |
| Relevant electrical parts | - Punch control board (PKCB) <br> - FS control board (FSCB) |  |

## (2) Procedure

1. Turn OFF the main power switch, disconnect and then connect the power cord. Wait for 10 sec . or more after connect the power cord, and turn ON the main power switch.
2. Rewrite the firmware.
3. Replace PKCB.
4. Replace FSCB.

### 3.10.2 C1004, C1014 (bizhub C658/C558/C458)

## (1) Contents

| Trouble type | - C1004: Finisher communication error (Engine detection) <br> - C1014: Finisher communication error (Finisher detection) |  |
| :---: | :---: | :---: |
| Rank | C |  |
| Trouble detection condition | <When FS-533, FS-536, FS-536SD, FS-537, or FS-537SD is installed> | When a communication error is detected between the MFP board (MFPB) and the FS control board (FSCB). |
|  | <When JS-506 is installed> | When a communication error is detected between the MFP board (MFPB) and the JS control board (JSCB). |
| Trouble isolation | - |  |
| Relevant electrical parts | <When FS-533, FS-536, FS-536SD, FS-537, or FS-537SD is installed> | - FS control board (FSCB) <br> - MFP board (MFPB) |
|  | <When JS-506 is installed> | JS control board (JSCB) |

## (2) Procedure

(a) When FS-533, FS-536, FS-536SD, FS-537, or FS-537SD is installed

1. Turn OFF the main power switch, disconnect and then connect the power cord. Wait for 10 sec. or more after connect the power cord, and turn ON the main power switch.
2. Rewrite the firmware.
3. Replace FSCB. (FS-533 / FS-536/FS-536SD / FS-537/FS-537SD)
4. PKCB ICP1 conduction check
5. PIDB ICP1 conduction check.
6. Replace MFPB.
(b) When JS-506 is installed
7. Turn OFF the main power switch, disconnect and then connect the power cord. Wait for 10 sec . or more after connect the power cord, and turn ON the main power switch.
8. Rewrite the firmware.
9. Replace JSCB.

### 3.10.3 C1007, C1017 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | • C1007: PI communication error (Finisher detection) <br> • C1017: PI communication error (PI detection) |
| :--- | :--- | :--- |
| Rank | C |
| Trouble detection condition | $<$ When FS-537+PI-507 or |
| FS-537SD+PI-507 is installed $>$ |  |$\quad$| When a communication error is detected between the FS control board |
| :--- |
| (FSCB) and the PI drive board (PIDB). |

## (2) Procedure

1. Turn OFF the main power switch, disconnect and then connect the power cord. Wait for 10 sec. or more after connect the power cord, and turn ON the main power switch.
2. Rewrite the firmware.
3. Replace PIDB.
4. Replace FSCB.

### 3.10.4 C1081, C1082 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | • C1081: SD communication error (Finisher detection) <br> • C1082: SD communication error (SD detection) |

| Trouble detection condition | <When FS-536SD or FS-537SD is <br> installed> |
| Trouble isolation | When a communication error is detected between the FS control board <br> (FSCB) and the SD control board (SDCB). |
| Relevant electrical parts | • SD control board (SDCB) <br> • FS control board (FSCB) |

## (2) Procedure

1. Turn OFF the main power switch, disconnect and then connect the power cord. Wait for 10 sec . or more after connect the power cord, and turn ON the main power switch.
2. Rewrite the firmware.
3. Replace SDCB. (FS-536/FS-536SD / FS-537/FS-537SD)
4. Replace FSCB. (FS-536/FS-536SD / FS-537/FS-537SD)

### 3.10.5 C1102 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | C1102: Main tray up/down motor's drive malfunction |  |
| :---: | :---: | :---: |
| Rank | B |  |
| Trouble detection condition | <When FS-533 is installed> | - While the exit tray is being lifted, the paper exit tray home sensor (PS107) is not turned OFF (unblocked) after the set period of time has elapsed after the tray lift up motor (M109) is turned ON. <br> - While the exit tray is being lowered, the paper exit tray home sensor (PS107) is not turned ON (blocked) after the set period of time has elapsed after the tray lift up motor (M109) is turned ON. |
|  | <When FS-536 or FS-536SD is installed> | - While the exit tray is being lifted, the main tray upper position sensor (PS26/PS27) is not turned ON (blocked) and the main tray upper position detect switch (SW2) is not turned ON, even after the main tray up/down motor (M11) turns by the set number of times <br> - While the exit tray is being lowered, the main tray full detection sensor (PS29) is not turned ON (blocked) after the set period of time has elapsed after the main tray up/down motor (M11) is turned ON. |
|  | <When FS-537 or FS-537SD is installed> | - The main tray lift up detection sensor (PS16/PS17) is not turned ON after the set period of time has elapsed after the main tray up/down motor (M6) is turned ON. <br> - The main tray full detection sensor (PS12) is not turned ON (unblocked) after the set period of time has elapsed after the main tray up/down motor (M6) is turned ON. |
| Trouble isolation | - |  |
| Relevant electrical parts | <When FS-533 is installed> | - Tray lift up motor (M109) <br> - Paper exit tray home sensor (PS107) <br> - FS control board (FSCB) |
|  | <When FS-536 or FS-536SD is installed> | - Main tray up/down motor (M11) <br> - Main tray upper position sensor/R (PS26) <br> - Main tray upper position sensor/F (PS27) <br> - Main tray full detection sensor (PS29) <br> - Main tray upper position detect switch (SW2) <br> - FS control board (FSCB) |
|  | <When FS-537 or FS-537SD is installed> | - Main tray up/down motor (M6) <br> - Main tray lift up detection sensor/F (PS16) <br> - Main tray lift up detection sensor/R (PS17) <br> - Main tray full detection sensor (PS12) <br> - FS control board (FSCB) |

## (2) Procedure

(a) When FS-533 is installed

1. Check the connector between M109-FSCB CN108 for proper connection and correct as necessary.
2. Check the connector of M109 for proper drive coupling, and correct as necessary.
3. Check the connector between PS107-FSCB CN110 for proper connection and correct as necessary.
4. PS107 I/O check, sensor check

- Control signal: FSCB CN110
- Location of electrical component: FS-533 7-D to E

5. M109 operation check

- Control signal: FSCB CN108
- Location of electrical component: FS-533 10-E

6. Replace M109.
7. FSCB CP109 conduction check
8. Replace FSCB.

NOTICE

- Link to the wiring diagram ( N.4.11 FS-533)
(b) When FS-536 or FS-536SD is installed
. Check the connector between M11-FSCB J9 for proper connection and correct as necessary.
Check the connector of M11 for proper drive coupling, and correct as necessary.
Check the connector between PS26-relay CN1-FSCB J14 for proper connection and correct as necessary.
. Check the connector between PS27-relay CN1-FSCB J14 for proper connection and correct as necessary.
. Check the connector between PS29-relay CN2-FSCB J14 for proper connection and correct as necessary.
. Check the connector between SW2-FSCB J10 for proper connection and correct as necessary.
. PS26 I/O check, sensor check
- Control signal: FSCB J14<A>-5 (ON)
- Location of electrical component: FS-536/FS-536SD 2-C

8. PS27 I/O check, sensor check

- Control signal: FSCB J14<B>-6 (ON)
- Location of electrical component: FS-536/FS-536SD 3-C

9. PS29 I/O check, sensor check

- Control signal: FSCB J14<A>-8 (ON)
- Location of electrical component: FS-536/FS-536SD 4-C

10. SW2 operation check

- Control signal: FSCB J10-1 to 2
- Location of electrical component: FS-536/FS-536SD 15-K

11. M11 operation check

- Control signal: FSCB J9<A>-9 to 10
- Location of electrical component: FS-536/FS-536SD 12-C

12. Replace M11
13. FSCB F2 conduction check
14. Replace FSCB.

NOTICE

- Link to the wiring diagram ( N.4.15 FS-536/FS-536SD)
(c) When FS-537 or FS-537SD is installed

1. Check the connector between M6-FSCB J23 for proper connection and correct as necessary.
. Check the connector of M6 for proper drive coupling and correct as necessary.
2. Check the connector between PS16-relay CN10<B>-FSCB J20 for proper connection and correct as necessary.
3. Check the connector between PS17-relay CN10<B>-FSCB J20 for proper connection and correct as necessary.
4. Check the connector between PS12-relay CN9-FSCB J19 for proper connection and correct as necessary.
5. PS16 I/O check, sensor check

- Control signal: FSCB J20<B>-4 (ON)
- Location of electrical component: FS-537/FS-537SD 11 to 12-D

7. PS17 I/O check, sensor check

- Control signal: FSCB J20<B>-7 (ON)
- Location of electrical component: FS-537/FS-537SD 12-D

8. PS12 I/O check, sensor check

- Control signal: FSCB J19-7 (ON)
- Location of electrical component: FS-537/FS-537SD 10-D

9. M6 operation check

- Control signal: FSCB J23-1 to 11
- Location of electrical component: FS-537/FS-537SD 13-D

10. Replace M6.
11. FSCB F3 conduction check
12. Replace FSCB.

NOTICE

- Link to the wiring diagram ( N.4.16 FS-537/FS-537SD)

### 3.10.6 C1103 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | C1103: Alignment motor/front's drive malfunction |  |  |
| :--- | :--- | :--- | :---: |
| Rank | B | • The alignment plate home sensor/F (PS108) is not turned OFF <br> (unblocked) after the set period of time has elapsed after the plate drive <br> starts from the home position. |  |
| Trouble detection condition | $<$ When FS-533 is installed> | The alignment plate home sensor/F (PS108) is not turned ON (blocked) <br> after the set period of time has elapsed after the alignment motor/F <br> (M105) is turned ON to return the plate to the home position. |  |
|  |  |  |  |

|  | <When FS-536 or FS-536SD is installed> | - The alignment plate/F home sensor (PS12) is not turned OFF (unblocked) after the set period of time has elapsed after the plate drive starts from the home position. <br> - The alignment plate/F home sensor (PS12) is not turned ON (blocked) after the set period of time has elapsed after the alignment motor/front (M7) is turned ON to return the plate to the home position. <br> - The alignment plate/F does not reach the specified position within the set period of time. |
| :---: | :---: | :---: |
|  | <When FS-537 or FS-537SD is installed> | - The alignment plate/F home sensor (PS9) is not turned OFF (unblocked) after the set period of time has elapsed after the plate drive starts from the home position. <br> - The alignment plate/F home sensor (PS9) is not turned ON (blocked) after the set period of time has elapsed after the alignment motor/front (M14) is turned ON to return the plate to the home position. <br> - The alignment plate/F does not reach the specified position within the set period of time. |
| Trouble isolation | - |  |
| Relevant electrical parts | <When FS-533 is installed> | - Alignment motor/F (M105) <br> - Alignment plate home sensor/F (PS108) <br> - FS control board (FSCB) |
|  | <When FS-536 or FS-536SD is installed> | - Alignment motor/front (M7) <br> - Alignment plate/F home sensor (PS12) <br> - FS control board (FSCB) |
|  | <When FS-537 or FS-537SD is installed> | - Alignment motor/front (M14) <br> - Alignment plate/F home sensor (PS9) <br> - FS control board (FSCB) |

## (2) Procedure

## (a) When FS-533 is installed

1. Check the connector between M105-FSCB CN102 for proper connection and correct as necessary.
2. Check the connector of M105 for proper drive coupling, and correct as necessary.
3. Check the connector between PS108-FSCB CN102 for proper connection and correct as necessary.
4. PS108 I/O check, sensor check

- Control signal: FSCB CN102
- Location of electrical component: FS-533 7-J

5. M105 operation check

- Control signal: FSCB CN102
- Location of electrical component: FS-533 7-J

6. Replace M105.
7. FSCB CP105 conduction check
. Replace FSCB
NOTICE

- Link to the wiring diagram ( N.4.11 FS-533)
(b) When FS-536 or FS-536SD is installed

1. Check the connector between M7-FSCB J4 for proper connection and correct as necessary.
. Check the connector of M7 for proper drive coupling and correct as necessary.
. Check the connector between PS12-FSCB J4 for proper connection and correct as necessary.
2. PS12 I/O check, sensor check

- Control signal: FSCB J4<B>-4 (ON)
- Location of electrical component: FS-536/FS-536SD 15-C

5. M7 operation check

- Control signal: FSCB J4<A>-5 to 8
- Location of electrical component: FS-536/FS-536SD 14-C

6. Replace M7.
7. Replace FSCB.

NOTICE

- Link to the wiring diagram ( N.4.15 FS-536/FS-536SD)
(c) When FS-537 or FS-537SD is installed
. Check the connector between M14-relay CN5-FSCB J18 for proper connection and correct as necessary.
. Check the connector of M14 for proper drive coupling and correct as necessary.
Check the connector between PS9-relay CN5-FSCB J18 for proper connection and correct as necessary.
. PS9 I/O check, sensor check
- Control signal: FSCB J18-10 (ON)
- Location of electrical component: FS-537/FS-537SD 6-D

5. M14 operation check

- Control signal: FSCB J18-1 to 4
- Location of electrical component: FS-537/FS-537SD 6-D

6. Replace M14.
7. Replace FSCB.

NOTICE

- Link to the wiring diagram ( N.4.16 FS-537/FS-537SD)

### 3.10.7 C1104 (bizhub C658/C558/C458)

## (1) Contents

| Trouble type | C1104: Stacker plate drive motor's malfunction |  |
| :--- | :--- | :--- |
| Rank | B |  |
| Trouble detection condition | $<$ When FS-537 or FS-537SD is <br> installed> | The stacker plate home sensor (PS30) is not turned OFF (unblocked) or ON <br> (blocked) even after the set period of time has elapsed after the stacker plate <br> drive motor (M3) is turned ON. |
| Trouble isolation | - | - Stacker plate drive motor (M3) <br> Relevant electrical parts <br> - Stacker plate home sensor (PS30) |

## (2) Procedure

1. Check the connector between M3-relay CN1<B>-FSCB J22 for proper connection and correct as necessary.
2. Check the connector of M3 for proper drive coupling and correct as necessary.

Check the connector between PS30-relay CN2-relay CN1<B>-FSCB J22 for proper connection, and correct as necessary.
PS30 I/O check, sensor check

- Control signal: FSCB J22<B>-10 (ON)
- Location of electrical component: FS-537/FS-537SD 3-D

5. M3 operation check

- Control signal: FSCB J22<B>1 to 2
- Location of electrical component: FS-537/FS-537SD 2-D

6. Replace M3.
7. Replace FSCB.

NOTICE

- Link to the wiring diagram ( N.4.16 FS-537/FS-537SD)

(1) Contents

| Trouble type | C1105: Bundle eject motor's drive malfunction |  |
| :---: | :---: | :---: |
| Rank | B |  |
| Trouble detection condition | <When FS-536 or FS-536SD is installed> | - The gripper home position sensor (PS18) is not turned ON (unblocked) even after the set period of time has elapsed after the gripper position detection sensor (PS19) turns OFF (block). <br> - The gripper position detection sensor (PS19) is not turned OFF (blocked) even after the set period of time has elapsed after PS19 turns ON (unblock). <br> - The gripper position detection sensor (PS19) is not turned ON (unblocked) even after the set period of time has elapsed after the gripper home position sensor (PS18) turns OFF (block). <br> - The gripper home position sensor (PS18) is not turned OFF (blocked) even after the set period of time has elapsed after the bundle eject motor (M10) is energized. <br> - The gripper home position sensor (PS18) and the gripper position detection sensor (PS19) is turned ON (unblocked) at the same time. |
|  | <When FS-537 or FS-537SD is installed> | The gripper home position sensor (PS3) is not turned OFF (blocked) or ON (unblocked) even after the set period of time has elapsed after the bundle eject motor (M1) is turned ON. |
| Trouble isolation | - |  |
| Relevant electrical parts | <When FS-536 or FS-536SD is installed> | - Bundle eject motor (M10) <br> - Gripper home position sensor (PS18) <br> - Gripper position detection sensor (PS19) <br> - FS control board (FSCB) |
|  | <When FS-537 or FS-537SD is installed> | - Bundle eject motor (M1) <br> - Gripper home position sensor (PS3) <br> - FS control board (FSCB) |

## (2) Procedure

(a) When FS-536 or FS-536SD is installed

1. Check the connector between M10-relay CN7<A>-FSCB J13 for proper connection, and correct as necessary.
2. Check the connector of M10 for proper drive coupling, and correct as necessary.
3. Check the connector between PS18-relay CN7<A>-FSCB J13 for proper connection, and correct as necessary.
4. Check the connector between PS19-relay CN7<B>-FSCB J12 for proper connection and correct as necessary.
5. PS18 I/O check, sensor check

- Control signal: FSCB J13-13 (ON)
- Location of electrical component: FS-536/FS-536SD 8-C

6. PS19 I/O check, sensor check

- Control signal: FSCB J12-3 (ON)
- Location of electrical component: FS-536/FS-536SD 7-C

7. M10 operation check

- Control signal: FSCB J13-1 to 2
- Location of electrical component: FS-536/FS-536SD 9-C

8. Replace M10
9. Replace FSCB

## NOTICE

- Link to the wiring diagram ( N.4.15 FS-536/FS-536SD)
(b) When FS-537 or FS-537SD is installed

1. Check the connector between M1-relay CN1<A>-FSCB J22 for proper connection and correct as necessary.
2. Check the connector of M1 for proper drive coupling and correct as necessary.
3. Check the connector between PS3-relay CN1<A>-FSCB J22 for proper connection and correct as necessary.
4. PS3 I/O check, sensor check

- Control signal: FSCB J22<A>-13 (ON)
- Location of electrical component: FS-537/FS-537SD 2-D

5. M1 operation check

- Control signal: FSCB J22<A>-1 to 2
- Location of electrical component: FS-537/FS-537SD 1-D

6. Replace M1.
7. Replace FSCB.

NOTICE

### 3.10.9 C1106 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | C1106: Stapler movement motor's malfunction |  |
| :---: | :---: | :---: |
| Rank | B |  |
| Trouble detection condition | <When FS-533 is installed> | - The stapler home sensor (PS110) is not turned OFF (unblocked) after the laps of given time after it started operating from the home position. <br> - The stapler home sensor (PS110) is not turned ON (blocked) after the laps of give time after the stapler movement motor (M107) turned ON when it returned to the home position. |
|  | <When FS-536 or FS-536SD is installed> | - The stapler home position sensor (rear) (PS23) is not turned OFF (unblocked) or ON (blocked) even after the set period of time has elapsed after the side stapler movement motor (M13) turned ON. <br> - The stapler does not reach the specified position within the set period of time. |
|  | <When FS-537 or FS-537SD is installed> | - The stapler home position sensor (PS18/PS19) is not turned OFF (unblocked) or ON (blocked) even after the set period of time has elapsed after the stapler movement motor (M19) turned ON. <br> - The stapler does not reach the specified position within the set period of time. |
| Trouble isolation | Staple |  |
| Relevant electrical parts | <When FS-533 is installed> | - Stapler movement motor (M107) <br> - Stapler home sensor (PS110) <br> - Stapler relay board (STREYB) <br> - FS control board (FSCB) |
|  | <When FS-536 or FS-536SD is installed> | - Side stapler movement motor (M13) <br> - Stapler home position sensor (rear) (PS23) <br> - FS control board (FSCB) |
|  | <When FS-537 or FS-537SD is installed> | - Stapler movement motor (M19) <br> - Stapler home position sensor (corner) (PS18) <br> - Stapler home position sensor (rear) (PS19) <br> - FS control board (FSCB) |

## (2) Procedure

(a) When FS-533 is installed
. Check the connector between M107-STREYB CN123 for proper connection, and correct as necessary.
2. Check the connector of M107 for proper drive coupling, and correct as necessary.
3. Check the connector between PS110-FSCB CN110 for proper connection, and correct as necessary.
4. PS110 I/O check, sensor check

- Control signal: FSCB CN110
- Location of electrical component: FS-533 8-D to E

5. M107 operation check

- Control signal: STREYB CN123-5 to 8
- Location of electrical component: FS-533 5-L

6. Replace M107.
7. Replace STREYB.
8. FSCB CP107 conduction check
9. Replace FSCB.

NOTICE

- Link to the wiring diagram ( N.4.11 FS-533)
(b) When FS-536 or FS-536SD is installed

1. Check the connector between M13-relay CN3-FSCB J11 for proper connection, and correct as necessary.
2. Check the connector of M13 for proper drive coupling and correct as necessary.
3. Check the connector between PS23-relay CN3-FSCB J11 for proper connection, and correct as necessary.
4. PS23 I/O check, sensor check

- Control signal: FSCB J11<B>-3 (ON)
- Location of electrical component: FS-536/FS-536SD 4-C

5. M13 operation check

- Control signal: FSCB J11<A>-1 to 4
- Location of electrical component: FS-536/FS-536SD 4-C

6. Replace M13.
7. Replace FSCB.

NOTICE

- Link to the wiring diagram ( N.4.15 FS-536/FS-536SD)
(c) When FS-537 or FS-537SD is installed

1. Check the connector between M19-FSCB J17 for proper connection and correct as necessary.
2. Check the connector of M19 for proper drive coupling and correct as necessary.
3. Check the connector between PS18-FSCB J16 for proper connection and correct as necessary.
4. Check the connector between PS19-FSCB J16 for proper connection and correct as necessary.
5. PS18 I/O check, sensor check

- Control signal: FSCB J16-9 (ON)
- Location of electrical component: FS-537/FS-537SD 15-D

6. PS19 I/O check, sensor check

- Control signal: FSCB J16-6 (ON)
- Location of electrical component: FS-537/FS-537SD 15-D

7. M19 operation check

- Control signal: FSCB J17-10 to 13
- Location of electrical component: FS-537/FS-537SD 14-D

8. Replace M19.
9. Replace FSCB.

NOTICE

| Trouble detection condition | <When FS-533 is installed> | The stapler home sensor (PS110) is not turned ON (blocked) even after the set period of time has elapsed after the stapler motor turned ON. |
|  | <When FS-536 or FS-536SD is installed> | - The stapler home position sensor (rear) (PS23) is not turned OFF (unblocked) or ON (blocked) even after the set period of time has elapsed after the stapler motor turned ON. <br> - The stapler position sensor (center) (PS24) is turned ON (blocked), when the stapler motor is running. |
|  | <When FS-537 or FS-537SD is installed> | - The stapler home position sensor (PS18/PS19) is not turned OFF (unblocked) or ON (blocked) even after the set period of time has elapsed after the stapler motor (M5) turned ON. <br> - The stapler position sensor (center) (PS20) is turned ON (blocked), when the stapler motor (M5) is running. |
| Trouble isolation | Staple |  |
| Relevant electrical parts | <When FS-533 is installed> | - Stapler home sensor (PS110) <br> - Stapler unit <br> - Stapler relay board (STREYB) <br> - FS control board (FSCB) |
|  | <When FS-536 or FS-536SD is installed> | - Stapler unit <br> - Stapler home position sensor (rear) (PS23) <br> - Stapler position sensor (center) (PS24) <br> - FS control board (FSCB) |
|  | <When FS-537 or FS-537SD is installed> | - Stapler unit <br> - Stapler home position sensor (corner) (PS18) <br> - Stapler home position sensor (rear) (PS19) <br> - Stapler position sensor (center) (PS20) <br> - FS control board (FSCB) |

## (2) Procedure

(a) When FS-533 is installed

1. Check the connector between the stapler unit-STREYB CN122, CN123 for proper connection and correct as necessary.
2. Check the connector of the stapler unit for proper drive coupling and correct as necessary.
3. Check the connector between PS110-FSCB CN110 for proper connection and correct as necessary.
4. PS110 I/O check, sensor check

- Control signal: FSCB CN110
- Location of electrical component: FS-533 8-D to E

5. Replace the stapler unit.
6. Replace STREYB.
7. Replace FSCB.

NOTICE

- Link to the wiring diagram ( N.4.11 FS-533)
(b) When FS-536 or FS-536SD is installed

1. Check the connector between the stapler unit-relay CN4-FSCB J11 for proper connection and correct as necessary.
2. Check the connector of the stapler unit for proper drive coupling and correct as necessary.
3. Check the connector between PS23-relay CN3-FSCB J11 for proper connection, and correct as necessary.
4. Check the connector between PS24-relay CN3-FSCB J11 for proper connection and correct as necessary.
5. PS23 I/O check, sensor check

- Control signal: FSCB J11<B>-3 (ON)
- Location of electrical component: FS-536/FS-536SD 4-C

6. PS24 I/O check, sensor check

- Control signal: FSCB J11<B>-6
- Location of electrical component: FS-536/FS-536SD 5-C

7. Replace the stapler unit.
8. Replace FSCB.

NOTICE

- Link to the wiring diagram ( N.4.15 FS-536/FS-536SD)
(c) When FS-537 or FS-537SD is installed

1. Check the connector between the stapler unit-FSCB J17 for proper connection and correct as necessary.
2. Check the connector of the stapler unit for proper drive coupling and correct as necessary.
3. Check the connector between PS18-FSCB J16 for proper connection and correct as necessary.
4. Check the connector between PS19-FSCB J16 for proper connection and correct as necessary.
5. Check the connector between PS20-FSCB J16 for proper connection and correct as necessary.
6. PS18 I/O check, sensor check

- Control signal: FSCB J16-9
- Location of electrical component: FS-537/FS-537SD 15-D

7. PS19 I/O check, sensor check

- Control signal: FSCB J16-6
- Location of electrical component: FS-537/FS-537SD 15-D

8. PS20 I/O check, sensor check

- Control signal: FSCB J16-3
- Location of electrical component: FS-537/FS-537SD 15-D

9. Replace the stapler unit.
10. Replace FSCB.

(1) Contents

| Trouble type | C1140: Alignment motor/rear's drive malfunction |  |
| :---: | :---: | :---: |
| Rank | B |  |
| Trouble detection condition | <When FS-533 is installed> | - The alignment plate home sensor/R (PS109) is not turned OFF (unblocked) after the set period of time has elapsed after the plate drive starts from the home position. <br> - The alignment plate home sensor/R (PS109) is not turned ON (blocked) after the set period of time has elapsed while the alignment motor/R (M106) is energized when the plate returns to the home position. |
|  | <When FS-536 or FS-536SD is installed> | The alignment plate/R home sensor (PS13) is not turned OFF (unblocked) or ON (blocked) even after the set period of time has elapsed while the alignment motor/rear (M8) is energized. |
|  | <When FS-537 or FS-537SD is installed> | The alignment plate/R home sensor (PS6) is not turned OFF (unblocked) or ON (blocked) even after the set period of time has elapsed while the alignment motor/rear (M13) is energized. |
| Trouble isolation | - |  |
| Relevant electrical parts | <When FS-533 is installed> | - Alignment motor/R (M106) <br> - Alignment plate home sensor/R (PS109) <br> - FS control board (FSCB) |
|  | <When FS-536 or FS-536SD is installed> | - Alignment motor/rear (M8) <br> - Alignment plate/R home sensor (PS13) <br> - FS control board (FSCB) |
|  | <When FS-537 or FS-537SD is installed> | - Alignment motor/rear (M13) <br> - Alignment plate/R home sensor (PS6) <br> - FS control board (FSCB) |

## (2) Procedure

## (a) When FS-533 is installed

1. Check the connector between M106-FSCB CN102 for proper connection and correct as necessary.
2. Check the connector of M106 for proper drive coupling and correct as necessary.
3. Check the connector between PS109-FSCB CN102 for proper connection and correct as necessary.
4. PS109 I/O check, sensor check

- Control signal: FSCB CN102
- Location of electrical component: FS-533 7-J

5. M106 operation check

- Control signal: FSCB CN102
- Location of electrical component: FS-533 8-J

6. Replace M106
7. FSCB CP105 conduction check
8. Replace FSCB

NOTICE

- Link to the wiring diagram ( N.4.11 FS-533)
(b) When FS-536 or FS-536SD is installed

1. Check the connector between M8-FSCB J12 for proper connection and correct as necessary.
2. Check the connector of M8 for proper drive coupling and correct as necessary.
3. Check the connector between PS13-FSCB J9 for proper connection and correct as necessary.
4. PS13 I/O check, sensor check

- Control signal: FSCB J9<B>-11 (ON)
- Location of electrical component: FS-536/FS-536SD 10-C

5. M8 operation check

- Control signal: FSCB J12-13 to 16 (ON)
- Location of electrical component: FS-536/FS-536SD 6-C

6. Replace M8.
7. Replace FSCB.

NOTICE

- Link to the wiring diagram ( N.4.15 FS-536/FS-536SD)
(c) When FS-537 or FS-537SD is installed

1. Check the connector between M13-relay CN3-FSCB J21 for proper connection and correct as necessary.
2. Check the connector of M13 for proper drive coupling and correct as necessary.
3. Check the connector between PS6-relay CN4-relay CN3-FSCB J21 for proper connection and correct as necessary.
4. PS6 I/O check, sensor check

- Control signal: FSCB J21-10 (ON)
- Location of electrical component: FS-537/FS-537SD 4-D

5. M13 operation check

- Control signal: FSCB J21-1 to 4
- Location of electrical component: FS-537/FS-537SD 4-D

6. Replace M13
7. Replace FSCB.

## (2) Procedure

## (a) When FS-536 or FS-536SD is installed

1. Check the connector between M5-FSCB J4 for proper connection and correct as necessary.
2. Check the connector of M5 for proper drive coupling and correct as necessary.
3. Check the connector between PS14-FSCB J4 for proper connection and correct as necessary.
4. PS14 I/O check, sensor check

- Control signal: FSCB J4<B>-7 (ON)
- Location of electrical component: FS-536/FS-536SD 15-C

5. M5 operation check

- Control signal: FSCB J4<A>-9 to 12
- Location of electrical component: FS-536/FS-536SD 14-C

6. Replace M5.
7. Replace FSCB

NOTICE

- Link to the wiring diagram ( N.4.15 FS-536/FS-536SD)
(b) When FS-537 or FS-537SD is installed

1. Check the connector between M9-relay CN13<B>-FSCB J14 for proper connection and correct as necessary.
2. Check the connector of M9 for proper drive coupling and correct as necessary.
3. Check the connector between PS25-relay CN13<B>-FSCB J14 for proper connection and correct as necessary.
4. PS25 I/O check, sensor check

- Control signal: FSCB J14<B>-10 (ON)
- Location of electrical component: FS-537/FS-537SD 16-K to L

5. M9 operation check

- Control signal: FSCB J14<B>-4 to 7
- Location of electrical component: FS-537/FS-537SD 17-K to L

6. Replace M9.
7. Replace FSCB.

## (2) Procedure

(a) When FS-536 or FS-536SD is installed

Check the connector between M9-relay CN7<A>-FSCB J13 for proper connection, and correct as necessary.
Check the connector of M9 for proper drive coupling and correct as necessary.
Check the connector between PS21-relay CN8-relay CN7<B>-FSCB J12 for proper connection, and correct as necessary
Check the connector between PS22-relay CN8-relay CN7<B>-FSCB J12 for proper connection, and correct as necessary
PS21 I/O check, sensor check

- Control signal: FSCB J12-6 (ON)
- Location of electrical component: FS-536/FS-536SD 7-C

6. PS22 I/O check, sensor check

- Control signal: FSCB J12-9 (ON)
- Location of electrical component: FS-536/FS-536SD 7-C

7. M9 operation check

- Control signal: FSCB J13-3 to 4
- Location of electrical component: FS-536/FS-536SD 9-C

8. Replace M9.
9. Replace FSCB.

NOTICE

- Link to the wiring diagram ( N.4.15 FS-536/FS-536SD)
(b) When FS-537 or FS-537SD is installed

1. Check the connector between M2-relay CN1<A>-FSCB J22 for proper connection and correct as necessary.
2. Check the connector of M2 for proper drive coupling and correct as necessary.
3. Check the connector between PS31-relay CN2-relay CN1<B>-FSCB J22 for proper connection, and correct as necessary.
4. PS31 I/O check, sensor check

- Control signal: FSCB J22<B>-13
- Location of electrical component: FS-537/FS-537SD 3-D

5. M2 operation check

- Control signal: FSCB J22<A>-3 to 4
- Location of electrical component: FS-537/FS-537SD 1-D

6. Replace M2.
7. Replace FSCB.

| Trouble isolation | Center Stapling/Half-Fold/Tri-Fold |  |  |  |  |

## (2) Procedure

1. Check the connector between M2-relay CN22 (FS-536SD), CN25 (FS-537SD)-relay CN21 (FS-536SD), CN26 (FS-537SD)-SDCB J5 for proper connection and correct as necessary.
2. Check the connector of M2 for proper drive coupling and correct as necessary.
3. Check the connector between PS2-relay CN22 (FS-536SD), CN25 (FS-537SD)-relay CN21 (FS-536SD), CN26 (FS-537SD)-SDCB J5 for proper connection and correct as necessary.
4. PS2 I/O check, sensor check

- Control signal: SDCB J5-3 (ON)
- Location of electrical component: FS-536/FS-536SD 4-L, FS-537/FS-537SD 3-K

5. M2 operation check

- Control signal: SDCB J5-4 to 7
- Location of electrical component: FS-536/FS-536SD 4-L, FS-537/FS-537SD 3-K

6. Replace M2. (FS-536SD / FS-537SD)
7. Replace SDCB. (FS-536SD / FS-537SD)
8. Replace FSCB. (FS-536SD / FS-537SD)

### 3.10.34 C1196 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | C1196: Center fold guide motor's malfunction |  |
| :--- | :--- | :--- |
| Rank | B |  |
| Trouble detection condition | <When FS-536SD or FS-537SD <br> installed $>$ | The guide home sensor (PS7) is not turned OFF (unblocked) or ON <br> (blocked) even after the set period of time has elapsed after the center fold <br> guide motor (M6) is turned ON. |
| Trouble isolation | Center Stapling/Half-Fold/Tri-Fold |  |
| Relevant electrical parts | <When FS-536SD or FS-537SD is <br> installed $>$ | • Center fold guide motor (M6) <br> • Guide home sensor (PS7) <br> • SD control board (SDCB) |

## (2) Procedure

1. Check the connector between M6-SDCB J9 for proper connection and correct as necessary.
2. Check the connector of M6 for proper drive coupling and correct as necessary.
3. Check the connector between PS7-SDCB J9 for proper connection and correct as necessary.
4. PS7 I/O check, sensor check

- Control signal: SDCB J9-6 (ON)
- Location of electrical component: FS-536/FS-536SD 5-P, FS-537/FS-537SD 4-P

5. M6 operation check

- Control signal: SDCB J9-7 to 10
- Location of electrical component: FS-536/FS-536SD 4-P, FS-537/FS-537SD 4-P

6. Replace M6. (FS-536SD / FS-537SD)
7. Replace SDCB. (FS-536SD / FS-537SD)
8. Replace FSCB. (FS-536SD / FS-537SD)

- Link to the wiring diagram ( N.4.16 FS-537/FS-537SD)

### 3.10.35 C1197 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | C1197: Tri-folding guide motor's malfunction |  |
| :---: | :---: | :---: |
| Rank | B |  |
| Trouble detection condition | <When FS-536SD or FS-537SD is installed> | The tri-folding gate home sensor (PS11) is not turned OFF (blocked) or ON (unblocked) even after the set period of time has elapsed while the tri-folding guide motor (M8) is energized. |
| Trouble isolation | Center Stapling/Half-Fold/Tri-Fold |  |
| Relevant electrical parts | <When FS-536SD or FS-537SD is installed> | - Tri-folding guide motor (M8) <br> - Tri-folding gate home sensor (PS11) <br> - SD control board (SDCB) <br> - FS control board (FSCB) |

## (2) Procedure

1. Check the connector between M8-SDCB J8 for proper connection and correct as necessary.
2. Check the connector of M8 for proper drive coupling and correct as necessary.
3. Check the connector between PS11-SDCB J8 for proper connection and correct as necessary
4. PS11 I/O check, sensor check

- Control signal: SDCB J8-10 (ON)
- Location of electrical component: FS-536/FS-536SD 3-P, FS-537/FS-537SD 3-P

5. M8 operation check

- Control signal: SDCB J8-11 to 14
- Location of electrical component: FS-536/FS-536SD 3-P, FS-537/FS-537SD 2-P

6. Replace M8. (FS-536SD / FS-537SD)
7. Replace SDCB. (FS-536SD / FS-537SD)
8. Replace FSCB. (FS-536SD / FS-537SD)

NOTICE

### 3.10.36 C11A1 (bizhub C658/C558/C458)

## (1) Contents

| Trouble type | C11A1: Exit roller pressure/ retraction malfunction (When FS-533 is installed) |  |  |
| :--- | :--- | :--- | :---: |
| Rank | B | The pick up roller position sensor (PS105) is not turned ON (blocked) or OFF <br> (unblocked) even after the set period of time has elapsed after the exit roller <br> lift up motor (M104) is turned ON. |  |
| Trouble detection condition | <When FS-533 is installed> |  |  |
| Trouble isolation | - | • Exit roller lift up motor (M104) <br> Relevant electrical parts <When FS-533 is installed> |  |

## (2) Procedure

1. Check the connector between M104-FSCB CN109 for proper connection and correct as necessary.
2. Check the connector of M104 for proper drive coupling and correct as necessary.
3. Check the connector between PS105-FSCB CN110 for proper connection and correct as necessary
4. PS105 I/O check, sensor check

- Control signal: FSCB CN110
- Location of electrical component: FS-533 7-D to E

5. M104 operation check

- Control signal: FSCB CN109
- Location of electrical component: FS-533 9-D to E

6. Replace M104.
7. FSCB CP104 conduction check
8. Replace FSCB.

NOTICE

### 3.10.37 C11A2 (bizhub C658/C558/C458)

## (1) Contents

| Trouble type | C11A2: Receiving roller retraction motor's drive malfunction |  |
| :---: | :---: | :---: |
| Rank | B |  |
| Trouble detection condition | <When FS-536 or FS-536SD is installed> | The receiving roller retraction sensor (PS11) is not turned OFF (blocked) or ON (unblocked) even after the set period of time has elapsed after the receiving roller retraction motor (M4) is turned ON. |
|  | <When FS-537 or FS-537SD is installed> | The receiving roller retraction sensor (PS22) is not turned OFF (blocked) or ON (unblocked) even after the set period of time has elapsed after the receiving roller retraction motor (M10) is turned ON. |
| Trouble isolation | - |  |
| Relevant electrical parts | <When FS-536 or FS-536SD is installed> | - Receiving roller retraction motor (M4) <br> - Receiving roller retraction sensor (PS11) <br> - FS control board (FSCB) |
|  | <When FS-537 or FS-537SD is installed> | - Receiving roller retraction motor (M10) <br> - Receiving roller retraction sensor (PS22) <br> - FS control board (FSCB) |

## (2) Procedure

(a) When FS-536 or FS-536SD is installed

1. Check the connector between M4-FSCB J4 for proper connection and correct as necessary.
2. Check the connector of M4 for proper drive coupling and correct as necessary.
. Check the connector between PS11-FSCB J4 for proper connection and correct as necessary.
3. PS11 I/O check, sensor check

- Control signal: FSCB J4<B>-16 (ON)
- Location of electrical component: FS-536/FS-536SD 16-C

5. M4 operation check

- Control signal: FSCB J4<A>-1 to 4
- Location of electrical component: FS-536/FS-536SD 13-C

6. Replace M4.
7. Replace FSCB.

NOTICE

- Link to the wiring diagram ( N.4.15 FS-536/FS-536SD)
(b) When FS-537 or FS-537SD is installed

1. Check the connector between M10-FSCB J12 for proper connection and correct as necessary.
2. Check the connector of M10 for proper drive coupling, and correct as necessary.
3. Check the connector between PS22-FSCB J12 for proper connection and correct as necessary.
4. PS22 I/O check, sensor check

- Control signal: FSCB J12<B>-7 (ON)
- Location of electrical component: FS-537/FS-537SD 17-D

5. M10 operation check

- Control signal: FSCB J12<B>-1 to 4
- Location of electrical component: FS-537/FS-537SD 17-D

6. Replace M10.
7. Replace FSCB.

NOTICE

- Link to the wiring diagram ( N.4.16 FS-537/FS-537SD)

### 3.10.38 C11C5 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | C11C5: Paper size detect board malfunction |  |
| :--- | :--- | :--- |
| Rank | B |  |
| Trouble detection condition | $<$ When FS-537+PK-523 or |  |
|  | FS-537SD+PK-523 is installed $>$ | The size of a transported paper is not detected, causing no punch operation. |
| Trouble isolation | - |  |
| Relevant electrical parts | Paper size detect board (PSDTB) |  |

## (2) Procedure

1. Check the sensor part of PSDTB, to clean if it is dirty.
2. Check the connector between PSDTB-PKCB CN38 for proper connection and correct as necessary.
3. Replace PSDTB.

### 3.10.39 C11E1 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | C11E1: Paper exit switching drive malfunction |
| :--- | :--- |
| Rank | B |

| Trouble detection condition | <When FS-536 or FS-536SD is installed> | The exchange folded paper output sensor (PS30) is not turned OFF (unblocked) or ON (blocked) even after the set period of time has elapsed after the FNS entry transport motor (M2) is turned ON. |
| :---: | :---: | :---: |
|  | <When FS-537 or FS-537SD is installed> | The route change gate home sensor (PS21) is not turned OFF (unblocked) or ON (blocked) even after the set period of time has elapsed after the route change gate motor (M4) is turned ON. |
| Trouble isolation | - |  |
| Relevant electrical parts | <When FS-536 or FS-536SD is installed> | - FNS entry transport motor (M2) <br> - Exchange folded paper output sensor (PS30) <br> - FS control board (FSCB) |
|  | <When FS-537 or FS-537SD is installed> | - Route change gate motor (M4) <br> - Route change gate home sensor (PS21) <br> - FS control board (FSCB) |

## (2) Procedure

(a) When FS-536 or FS-536SD is installed
. Check the connector between M2-FSCB J9 for proper connection and correct as necessary.
2. Check the connector of M2 for proper drive coupling and correct as necessary.
. Check the connector between PS30-FSCB J4 for proper connection and correct as necessary.
4. PS30 I/O check, sensor check

- Control signal: FSCB J4<A>-15 (ON)
- Location of electrical component: FS-536/FS-536SD 14-C

5. M2 operation check

- Control signal: FSCB J9<A>-1 to 4
- Location of electrical component: FS-536/FS-536SD 12-C

6. Replace M2.
7. Replace FSCB.

NOTICE

- Link to the wiring diagram ( N.4.15 FS-536/FS-536SD)
(b) When FS-537 or FS-537SD is installed

1. Check the connector between M4-FSCB J12 for proper connection and correct as necessary.
2. Check the connector of M4 for proper drive coupling and correct as necessary.
3. Check the connector between PS21-FSCB J12 for proper connection and correct as necessary.
4. PS21 I/O check, sensor check

- Control signal: FSCB J12<B>-12 (ON)
- Location of electrical component: FS-537/FS-537SD 18-D

5. M4 operation check

- Control signal: FSCB J21<B>-8 to 9
- Location of electrical component: FS-537/FS-537SD 18-D

6. Replace M4.
7. Replace FSCB.

NOTICE

- Link to the wiring diagram ( N.4.16 FS-537/FS-537SD)

### 3.10.40 C11E2 (bizhub C658/C558/C458)

## (1) Contents

| Trouble type | C11E2: Paper exit switching (JS) drive malfunction |  |
| :--- | :--- | :--- |
| Rank | B |  |
| Trouble detection condition | $<$ When FS-537 or FS-537SD is <br> installed> | The sub tray/JS route change gate home sensor (PS23) is not turned OFF <br> (unblocked) or ON (blocked) even after the set period of time has elapsed <br> after the sub tray discharge motor (M18) is turned ON. |
| Trouble isolation | - | - Sub tray discharge motor (M18) <br> Relevant electrical parts <br> - Sub tray/JS route change gate home sensor (PS23) |

## (2) Procedure

1. Check the connector between M18-FSCB J12 for proper connection and correct as necessary.
2. Check the connector of M18 for proper drive coupling and correct as necessary.
3. Check the connector between PS23-FSCB J12 for proper connection and correct as necessary.
4. PS23 I/O check, sensor check

- Control signal: FSCB J12<A>-16 (ON)
- Location of electrical component: FS-537/FS-537SD 17-D

5. M18 operation check

- Control signal: FSCB $J 12<A>-5$ to 6
- Location of electrical component: FS-537/FS-537SD 16-D

6. Replace M18.
7. Replace FSCB.

## NOTICE

- Link to the wiring diagram ( N.4.16 FS-537/FS-537SD)

### 3.10.41 C1402 (bizhub C658/C558/C458)

## (1) Contents

| Trouble type | C1402: FS nonvolatile memory error (When FS-533 is installed) |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | When the main power switch is turned ON, malfunctioning of the nonvolatile memory on the FS control board <br> (FSCB) is detected. |
| Trouble isolation | - |
| Relevant electrical parts | FS control board (FSCB) |

## (2) Procedure

1. Turn OFF the main power switch, disconnect and then connect the power cord. Wait for 10 sec. or more after connect the power cord and turn ON the main power switch.
2. Rewrite the firmware.
3. Replace FSCB.

### 3.10.42 C1403 (bizhub C658/C558/C458)

(1) Contents

$\left.$| Trouble type | C1403: PK flash ROM error |
| :--- | :--- | :--- |
| Rank | C |
| Trouble detection condition | <When FS-537+PK-523 or |
|  | FS-537SD+PK-523 is installed> |$\quad$| Data of flash ROM of the PK is determined to be faulty when the main power |
| :--- |
| switch is turned ON. | \right\rvert\,

## (2) Procedure

1. Turn OFF the main power switch, disconnect and then connect the power cord. Wait for 10 sec . or more after connect the power cord, and turn ON the main power switch.
2. Rewrite the firmware.
3. Replace PKCB.

### 3.10.43 C1404 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | C1404: PI flash ROM error |  |
| :--- | :--- | :--- |
| Rank | C |  |
| Trouble detection condition | <When FS-537+PI-507 or |  |
| FS-537SD+PI-507 is installed $>$ | Data of flash ROM of the PI is determined to be faulty when the main power <br> switch is turned ON. |  |
| Trouble isolation | - |  |
| Relevant electrical parts | PI drive board (PIDB) |  |

## (2) Procedure

1. Turn OFF the main power switch, disconnect and then connect the power cord. Wait for 10 sec . or more after connect the power cord, and turn ON the main power switch.
2. Rewrite the firmware.
3. Replace PIDB.

### 3.11 C2\#\#\# (bizhub C368/C308/C258)

### 3.11.1 C2152, C2153, C2154, C2155, C2156 (bizhub C368/C308/C258)

| Rank | B |
| Trouble detection condition | The status with the new unit is not cleared after the new developing unit is set. |
| Trouble isolation | - |
| Relevant electrical parts | - Developing unit <br>  <br>  <br>  <br>  <br> - Front side board (FRB) <br> - MFP board (MFPB) |

## (2) Procedure

1. Reinstall developing unit.
2. Check the connector between the developing unit-FRB CN13 (C2414), CN14 (C2411), CN15 (C2412), CN16 (C2413) for proper connection and correct as necessary.
3. Check the connector between FRB CN1, CN3-MFPB CN4E, CN11E for proper connection and correct as necessary.
4. Replace the developing unit.
5. Replace FRB.
6. Replace MFPB.

### 3.11.6 C2551, C2553, C2555 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | - C2551: Abnormally low toner density detected cyan TCR sensor <br> - C2553: Abnormally low toner density detected magenta TCR sensor <br> - C2555: Abnormally low toner density detected yellow TCR sensor |
| :---: | :---: |
| Rank | B |
| Trouble detection condition | When sampling data is determined in TC ratio calculation control, TCR sensor output is higher than a predetermined value for a predetermined number of times in a row even though there is toner in the sub hopper. |
| Trouble isolation | - |
| Relevant electrical parts | - Developing unit/C,M,Y <br> - Toner cartridge/C,M,Y <br> - Toner empty sensor/Y (PS34) <br> - Toner empty sensor/M (PS33) <br> - Toner empty sensor/C (PS32) <br> - Toner cartridge motor/Y,M,C (M10) <br> - Toner supply motor/Y (M9) <br> - Toner supply motor/M (M8) <br> - Toner supply motor/C (M7) <br> - Front side board (FRB) <br> - MFP board (MFPB) |

## (2) Procedure

1. Perform image troubleshooting procedure if image density is low.
2. Reinstall developing unit.
3. Reinstall toner cartridge.
4. Check the connector between the developing unit-FRB CN14 (C2551), CN15 (C2553), CN16 (C2555) for proper connection and correct as necessary.
5. Check the connector between FRB CN1, CN3-MFPB CN4E, CN11E for proper connection and correct as necessary.
6. M10 operation check

- Control signal: MFPB CN16E-1 to 4
- Location of electrical component: 15-C

7. M7, M8, M9 operation check

- Control signal: MFPB CN16E-5 to 8 (M7), MFPB CN16E-9 to 12 (M8), MFPB CN16E-13 to 16 (M9)
- Location of electrical component: 15-C (M7, M8), 16-C (M9)

8. If the toner empty sensor and its surroundings inside the sub hopper are dirtied with toner, clean them.
9. Replace the developing unit.
10. Replace FRB.
11. Replace MFPB.

## NOTICE

### 3.11.7 C2552, C2554, C2556, C2558 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | - C2552: Abnormally high toner density detected cyan TCR sensor <br> - C2554: Abnormally high toner density detected magenta TCR sensor <br> - C2556: Abnormally high toner density detected yellow TCR sensor <br> - C2558: Abnormally high toner density detected black TCR sensor |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | The TC ratio of the toner determined by the toner replenishment control is detected to be the predetermined <br> value or over for consecutive times. |
| Trouble isolation | - |
| Relevant electrical parts | - Developing unit/C,M,Y,K <br> - Toner cartridge/C,M,Y,K <br> - Front side board (FRB) |
|  | - MFP board (MFPB) |

## (2) Procedure

1. Reinstall developing unit.
2. Reinstall toner cartridge.
3. Check the connector between the developing unit-FRB CN13 (C2558), CN14 (C2552), CN15 (C2554), CN16 (C2556) for proper connection and correct as necessary.
4. Check the connector between FRB CN1, CN3-MFPB CN4E, CN11E for proper connection and correct as necessary.
5. Replace the developing unit.
6. Replace FRB.
7. Replace MFPB.

### 3.11.8 C2557 (bizhub C368/C308/C258)

## (1) Contents

| Trouble type | C2557: Abnormally low toner density detected black TCR sensor |
| :---: | :---: |
| Rank | B |
| Trouble detection condition | When sampling data is determined in TC ratio calculation control, TCR sensor output is higher than a predetermined value for a predetermined number of times in a row even though there is toner in the sub hopper. |
| Trouble isolation | - |
| Relevant electrical parts | - Developing unit/K <br> - Toner cartridge/K <br> - Toner empty sensor/K (PS31) <br> - Toner cartridge motor/K (M25) <br> - Toner supply motor/K (M6) <br> - Front side board (FRB) <br> - MFP board (MFPB) |

## (2) Procedure

1. Perform image troubleshooting procedure if image density is low.
2. Reinstall developing unit/K.
3. Reinstall toner cartridge/K.
4. Check the connector between the developing unit/K-FRB CN13 for proper connection and correct as necessary.
5. Check the connector between FRB CN1, CN3-MFPB CN4E, CN11E for proper connection and correct as necessary.
6. M25 operation check

- Control signal: MFPB CN30E-1 to 4
- Location of electrical component: 16-C

7. M6 operation check

- Control signal: MFPB CN30E-5 to 8
- Location of electrical component: 17-C

8. If the toner empty sensor and its surroundings inside the sub hopper are dirtied with toner, clean them.
9. Replace the developing unit/K.
10. Replace FRB.
11. Replace MFPB.

### 3.11.9 C2559, C255A, C255B (bizhub C368/C308/C258)

## (1) Contents

| Trouble type | - C2559: Cyan TCR sensor adjustment failure <br> - C255A: Magenta TCR sensor adjustment failure <br> - C255B: Yellow TCR sensor adjustment failure |
| :---: | :---: |
| Rank | B |
| Trouble detection condition | TCR sensor automatic adjustment does not function properly, failing to adjust to an appropriate value. |
| Trouble isolation | - |
| Relevant electrical parts | - Developing unit/C,M,Y <br> - Toner cartridge motor/Y,M,C (M10) <br> - Toner supply motor/Y (M9) <br> - Toner supply motor/M (M8) <br> - Toner supply motor/C (M7) <br> - Front side board (FRB) <br> - MFP board (MFPB) |

## (2) Procedure

1. Reinstall developing unit.
2. Check the connector between the developing unit-FRB CN14 (C2559), CN15 (C255A), CN16 (C255B) for proper connection and correct as necessary.
3. Check the connector between FRB CN1, CN3-MFPB CN4E, CN11E for proper connection and correct as necessary.
4. M10 operation check

- Control signal: MFPB CN16E-1 to 4
- Location of electrical component: 15-C

5. M7, M8, M9 operation check

- Control signal: MFPB CN16E-5 to 8 (M7), MFPB CN16E-9 to 12 (M8), MFPB CN16E-13 to 16 (M9)
- Location of electrical component: 15-C (M7, M8), 16-C (M9)

6. Replace the developing unit.
7. Replace FRB.
8. Replace MFPB.

## (1) Contents

| Trouble type | • C2561: Cyan TCR sensor failure |
| :--- | :--- |
|  | - C2562: Magenta TCR sensor failure |
|  | - C2563: Yellow TCR sensor failure |

|  | • C2564: Black TCR sensor failure |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | Alarm signals for each TCR sensor is detected more than the predetermined number of times. <br> This detection is used for detecting disconnection of TCR sensor connector. |
| Trouble isolation | $-\quad$ |
| Relevant electrical parts | - Developing unit/C,M,Y,K <br> i Front side board (FRB) <br> - MFP board (MFPB) |

## (2) Procedure

1. Reinstall developing unit.
2. Check the connector between the developing unit-FRB CN13 (C2564), CN14 (C2561), CN15 (C2562), CN16 (C2563) for proper connection and correct as necessary.
3. Check the connector between FRB CN1, CN3-MFPB CN4E, CN11E for proper connection and correct as necessary.
4. Replace the developing unit.
5. Replace FRB.
6. MFPB ICP2E conduction check
7. Replace MFPB.

### 3.11.12 C2650 (bizhub C368/C308/C258)

## (1) Contents

| Trouble type | C2650: Main backup media access error |
| :---: | :---: |
| Rank | C |
| Trouble detection condition | - The re-written data, which has been read out, checked and founded as error, is read out again and found as error. <br> - The error was found when reading out the counter value. <br> - The main body detects that the EEPROM is not mounted. |
| Trouble isolation | - |
| Relevant electrical parts | - EEPROM/1 <br> - EEPROM/2 <br> - MFP board (MFPB) |

## (2) Procedure

1. Make sure that EEPROM/1 and EEPROM/2 are mounted in their respective correct positions.
2. Check to see if the EEPROM is mounted in a reverse direction.
3. Check the connector from MFPB to EEPROM for proper connection and correct as necessary.
4. Replace MFPB.
5. Replace EEPROM/1 and EEPROM/2.
6. Replace the current EEPROM with a new one.
7. Replace the following components with new ones.

When the transfer belt unit and the fusing unit have been replaced with new ones, perform [New Release] in the service mode. When the transfer roller has been replaced with a new one, perform [Counter clear].

- Developing unit/Y,M,C,K
- Drum unit/Y,M,C,K
- Toner cartridge/Y,M,C,K
- Transfer belt unit
- Fusing unit
- Transfer roller
- Feed roller, pick-up roller, separation roller (including options)

3. Turn ON the main power switch and check to see that warm-up is started.

Make sure that malfunction codes other than C2650 or improper IU/TC placement is not detected.
4. Make the specified readjustments.
6. If the above actions do not solve the problem, contact KM.

### 3.11.13 C2A11, C2A12, C2A13, C2A14 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | - C2A11: Drum unit/C new release failure <br>  <br>  <br>  <br>  <br> - C2A12: Drum unit/M new release failure <br> - C2A13: Drum unit/Y new release failure |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | The status with the new unit is not cleared after the new drum unit is set. |
| Trouble isolation | - |
| Relevant electrical parts | - Drum unit/C,M,Y,K <br>  <br>  <br>  <br>  <br> - Front side board (FRB) |

## (2) Procedure

1. Clean the connection between the drum unit and the machine if dirty.
2. Reinstall the drum unit.
3. Check the connector between the drum unit-FRB CN12 for proper connection and correct as necessary.
4. Check the connector between FRB CN1, CN3-MFPB CN4E, CN11E for proper connection and correct as necessary.
5. Replace the drum unit.
6. Replace FRB.
7. Replace MFPB.

### 3.11.14 C2A21, C2A22, C2A23, C2A24 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | - C2A21: Toner cartridge/C new release failure <br> - C2A22: Toner cartridge/M new release failure <br> - C2A23: Toner cartridge/Y new release failure <br> - C2A24: Toner cartridge/K new release failure |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | The status with the new unit is not cleared after the new toner cartridge is set. |
| Trouble isolation | - |
| Relevant electrical parts | - Toner cartridge/ C,M,Y,K <br>  <br> $\quad$MFP board (MFPB) |

## (2) Procedure

1. Clean the connection between the toner cartridge and the machine if dirty.
2. Check the connector between the toner cartridge-relay CN79-MFPB CN35E for proper connection and correct as necessary
3. Reinstall the toner cartridge.
4. Check the harness for proper connection and correct as necessary.
5. Replace the toner cartridge.
6. Replace MFPB.

### 3.12 C2\#\#\# (bizhub C658/C558/C458)

### 3.12.1 C2152, C2153, C2154, C2155, C2156 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | - C2152: Transfer belt fault at initial position return <br> - C2153: Transfer belt spacing fault at K pressure switching <br> - C2154: Transfer belt contact fault at all pressure switching <br> - C2155: Transfer belt contact fault after K pressure established <br> - C2156: Transfer belt spacing fault after all pressure established |
| :---: | :---: |
| Rank | B |
| Trouble detection condition | - C2152: The 1st transfer pressure sensor (PS39) is unable to detect "switch from retraction to pressure" or "switch from pressure to retraction" within a given period time after the 1st transfer pressure clutch (CL5) has stared engagement during an initial position return. <br> - C2153: The 1st transfer pressure sensor (PS39) does not detect "switch from pressure to retraction" within a given period time after 1st transfer pressure clutch (CL5) has stared engagement. <br> - C2154: The 1st transfer pressure sensor (PS39) does not detect "switch from retraction to pressure" within a given period time after 1st transfer pressure clutch (CL5) has stared engagement. <br> - C2155: The 1st transfer pressure sensor (PS39) is blocked after the lamps of given time after the 1st transfer pressure clutch (CL5) turned OFF when the release operation is finished. <br> - C2156: The 1st transfer pressure sensor (PS39) is unblocked after the laps of given time after the 1st transfer pressure clutch (CL5) turned OFF when the pressing operation is finished. |
| Trouble isolation | - |

## (2) Procedure

1. Check the connector between M3-MFPB CN14E for proper connection and correct as necessary.
2. Check the connector of M3 for proper drive coupling and correct as necessary.
3. Check the connector between PS39-relay CN113-MFPB CN15E for proper connection and correct as necessary.
4. Check the connector between CL5-relay CN118-EXCB CN8 for proper connection and correct as necessary.
5. PS39 I/O check, sensor check

- Control signal: MFPB CN15E<B>-10 (ON)
- Location of electrical component: C658/C558 18-C, C458 21-C

6. CL5 operation check

- Control signal: EXCB CN8<A>-4 (CL5_REM)
- Location of electrical component: 25-T

7. M3 operation check

- Control signal: MFPB CN14E-9 (REM), MFPB CN14E-12 (LOCK)
- Location of electrical component: 2-C

8. Replace M3.
9. Replace EXCB.
10. MFPB F6E conduction check
11. Replace MFPB.

| Relevant electrical parts | - Developing unit/C,M,Y,K <br> - Front side board (FRB) <br> - MFP board (MFPB) |

## (2) Procedure

1. Reinstall the developing unit.
2. Check the connector between the developing unit-FRB CN13 (C2564), CN14 (C2561), CN15 (C2562), CN16 (C2563) for proper connection and correct as necessary.
3. Check the connector between FRB CN1, CN3-MFPB CN4E, CN5E for proper connection and correct as necessary.
4. Replace the developing unit.
5. Replace FRB.
6. Replace MFPB.

### 3.12.11 C2650, C265B (bizhub C658/C558/C458)

(1) Contents

| Trouble type | - C2650: Main backup media access error 1 <br> - C265B: Main backup media access error 2 |
| :---: | :---: |
| Rank | C |
| Trouble detection condition | - The re-written data, which has been read out, checked and founded as error, is read out again and found as error. <br> - The error was found when reading out the counter value. <br> - The main body detects that the EEPROM is not mounted. |
| Trouble isolation | - |
| Relevant electrical parts | - C2650: EEPROM1 (EEPROM/1) <br> - C265B: EEPROM2 (EEPROM/2) <br> - MFP board (MFPB) |

## (2) Procedure

1. Make sure that EEPROM/1 and EEPROM/2 are mounted in their respective correct positions.
2. Check to see if the EEPROM is mounted in a reverse direction
3. Check the connector from MFPB to EEPROM for proper connection and correct as necessary.
4. Replace MFPB.
5. Replace EEPROM/1 and EEPROM/2.
6. Replace the current EEPROM with a new one.
7. Replace the following components with new ones.

When the transfer belt unit and the fusing unit have been replaced with new ones, perform [New Release] in the service mode. When the transfer roller has been replaced with a new one, perform [Counter clear].

- Developing unit/Y,M,C,K
- Drum unit/Y,M,C,K
- Toner cartridge/Y,M,C,K
- Transfer belt unit
- Fusing unit
- Transfer roller
- Feed roller, pick-up roller, separation roller (including options)

3. Turn ON the main power switch and check to see that warm-up is started. Make sure that malfunction codes other than C2650 or improper IU/TC placement is not detected.
4. Make the specified readjustments.
5. If the above actions do not solve the problem, contact KM.

### 3.12.12 C265A (bizhub C658/C558/C458)

(1) Contents

| Trouble type | C265A: Main backup media wrongly installation |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | The EEPROM/1 and EEPROM/2 are mounted in a reverse direction. |
| Trouble isolation | - |
| Relevant electrical parts | • EEPROM1 (EEPROM/1) |

## (2) Procedure

1. Check to see if the EEPROM/1 and EEPROM/2 are mounted in a reverse direction.
2. Check the type of the installed EEPROM and replace it if it is a wrong one.
3. Replace EEPROM/1 and EEPROM/2.

### 3.12.13 C2A11, C2A12, C2A13, C2A14 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | - C2A11: Drum unit/C new release failure <br> - C2A12: Drum unit/M new release failure <br> - C2A13: Drum unit/Y new release failure <br> - C2A14: Drum unit/K new release failure |
| :---: | :---: |
| Rank | B |
| Trouble detection condition | The status with the new unit is not cleared after the new drum unit is set. |
| Trouble isolation | - |
| Relevant electrical parts | - Drum unit/C,M,Y,K <br> - Front side board (FRB) <br> - MFP board (MFPB) |

## (2) Procedure

1. Clean the connection between the drum unit and the main body if dirty.
2. Reinstall the drum unit.
3. Check the connector between the drum unit-FRB CN12 for proper connection and correct as necessary
4. Check the connector between FRB CN1, CN3-MFPB CN4E, CN5E for proper connection and correct as necessary.
5. Replace the drum unit.
6. Replace FRB.
7. Replace MFPB.

### 3.12.14 C2A21, C2A22, C2A23, C2A24 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | - C2A21: Toner cartridge/C new release failure <br>  <br>  <br>  <br> - C2A22: Toner cartridge/M new release failure <br> - C2A23: Toner cartridge/Y new release failure |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | The status with the new unit is not cleared after the new toner cartridge is set. |
| Trouble isolation | - |
| Relevant electrical parts | - Toner cartridge/ C,M,Y,K |
|  | - Expansion control board (EXCB) |

## (2) Procedure

1. Clean the connection between the toner cartridge and the main body if dirty.
2. Check the connector between the toner cartridge-relay CN79-EXCB CN5 for proper connection and correct as necessary.
3. Reinstall the toner cartridge.
4. Check the harness for proper connection and correct as necessary.
5. Replace the toner cartridge.
6. Replace EXCB.

### 3.13 C3\#\#\# (bizhub C368/C308/C258)

### 3.13.1 C3101, C3103 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | •C3101: Pressure roller pressure failure |
| :--- | :--- |

| Rank | B |
| :---: | :---: |
| Trouble detection condition | C3101: <br> - The encoder pulse does not change even after the lapse of a predetermined period of time after the fusing pressure motor (M11) has started rotating during pressure by the pressure roller. <br> - The fusing pressure home sensor (PS38) is not blocked even after the lapse of a predetermined period of time after the fusing pressure motor (M11) has started rotating during pressure by the pressure roller. |
|  | C3103: <br> - The encoder pulse does not change even after the lapse of a predetermined period of time after the fusing pressure motor (M11) has started rotating during retraction of the pressure roller. <br> - The fusing pressure home sensor (PS38) is not unblocked even after the lapse of a predetermined period of time after the fusing pressure motor (M11) has started rotating during retraction of the pressure roller. |
| Trouble isolation | - |
| Relevant electrical parts | - Fusing unit <br> - Fusing pressure motor (M11) <br> - Fusing pressure home sensor (PS38) <br> - MFP board (MFPB) |

## (2) Procedure

1. Check the connector between M11-MFPB CN15EA for proper connection and correct as necessary.
2. Check the connector between the fusing unit-relay CN98, CN99, CN104-MFPB CN13E for proper connection and correct as necessary.
3. PS38 I/O check, sensor check

- Control signal: MFPB CN13E-12 (ON)
- Location of electrical component: 11-C

4. M11 operation check

- Control signal: MFPB CN15EA-5 to 8
- Location of electrical component: 6-C

5. Replace M11.
6. Replace the fusing unit.
7. Replace MFPB.

### 3.13.2 C3201, C3202 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | • C3201: Fusing motor failure to turn <br> - C3202: Fusing motor turning at abnormal timing |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | - C3201: The motor lock signal remains HIGH for a predetermined continuous period of time while the motor <br> is turning. <br> - C3202: The motor lock signal remains LOW for a predetermined continuous period of time while the motor <br> remains stationary. |
| Trouble isolation | $-\quad$ - Fusing motor (M3) |
| Relevant electrical parts | - MFP board (MFPB) |

## (2) Procedure

1. Check the connector between M3-MFPB CN8E for proper connection and correct as necessary.
2. Check the loading status of the fusing unit drive, and correct the error as necessary.
3. M3 operation check

- Control signal: MFPB CN8E-9 (REM), MFPB CN8E-12 (LOCK)
- Location of electrical component: 2-C

4. Replace M3.
5. Replace MFPB.

NOTICE

- Link to the wiring diagram ( N. 1 bizhub C368/C308/C258)

### 3.13.3 C3302 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | C3302: Paper cooling fan failure to turn |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | The fan lock signal remains HIGH for a predetermined continuous period of time while the fan is turning. |
| Trouble isolation | - |
| Relevant electrical parts | - Paper cooling fan (FM8) |

## (2) Procedure

1. Check the connector between FM8-relay CN106-MFPB CN15EB for proper connection and correct as necessary.
2. Check the fan for possible overload and correct as necessary.
3. FM8 operation check

- Control signal: MFPB CN15EB-9 (REM), MFPB CN15EB-11 (LOCK)
- Location of electrical component: 9-C

4. Replace FM8.
5. MFPB ICP3E conduction check
6. Replace MFPB.

NOTICE

- Link to the wiring diagram ( N. 1 bizhub C368/C308/C258)

### 3.13.4 C3425 (bizhub C368/C308/C258)

## (1) Contents

| Trouble type | C3425: Fusing warm-up trouble |
| :---: | :---: |
| Rank | A |
| Trouble detection condition | - Detected temperature of the heating roller temperature sensor (TEMS) does not go up a given range of temperature even after a lapse of given period of time at warm up. <br> - The temperature detected by the heating roller temperature sensor (TEMS) does not shift from the pre-standby state or the post-print color printing-enable wait state even after the lapse of a predetermined period of time after the completion of warm-up. |
| Trouble isolation | - |
| Relevant electrical parts | - Fusing unit <br> - Heating roller temperature sensor (TEMS) <br> - DC power supply (DCPU) <br> - MFP board (MFPB) |

## (2) Procedure

1. Check the fusing unit for correct installation (whether it is secured in position).
2. Check the open/close operation of the right door.
3. Check the fusing unit and DCPU for proper connection and correct or change as necessary.
4. Replace the fusing unit.
5. Replace MFPB.
6. Replace DCPU.

### 3.13.5 C3722, C3725, C3726 (bizhub C368/C308/C258)

## (1) Contents

| Trouble type | - C3722: Fusing abnormally high temperature detection (Edge of the heating roller) <br> - C3725: Fusing abnormally high temperature detection (Main of the heating roller) <br> - C3726: Fusing abnormally high temperature detection (Center of the heating roller) |
| :---: | :---: |
| Rank | A |
| Trouble detection condition | - C3722: Detected temperature of the heating roller thermistor/1 (TH1) goes beyond a given temperature for a given period of time consecutively. <br> - C3725: Detected temperature of the heating roller temperature sensor (TEMS) goes beyond a given temperature for a given period of time consecutively. <br> - C3726: Detected temperature of the heating roller thermistor/2 (TH2) goes beyond a given temperature for a given period of time consecutively. |
| Trouble isolation | - |
| Relevant electrical parts | - Fusing unit <br> - C3722: Heating roller thermistor/1 (TH1) <br> - C3725: Heating roller temperature sensor (TEMS) <br> - C3726: Heating roller thermistor/2 (TH2) <br> - MFP board (MFPB) |

## (2) Procedure

1. Check the fusing unit for correct installation (whether it is secured in position).
2. Check the open/close operation of the right door.
3. Check the fusing unit and MFPB for proper connection and correct or change as necessary.
4. Replace the fusing unit.
5. Replace MFPB.

### 3.13.6 C3731 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | C3731: Fusing abnormally high temperature detection (Hard protector) |
| :--- | :--- |
| Rank | A |
| Trouble detection condition | The hard protector signal error is detected for a given period of time consecutively. |
| Trouble isolation | - |
| Relevant electrical parts | - Fusing unit <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br> - Heating roller thermistor/1 (TH1) <br> - Heating roller temperature sensor (TEMS) <br> - MFP board (MFPB) |

## (2) Procedure

1. Check the fusing unit for correct installation (whether it is secured in position).
2. Check the open/close operation of the right door.
3. Check the fusing unit and MFPB for proper connection and correct or change as necessary.
4. Replace the fusing unit.
5. Replace MFPB.

### 3.13.7 C3825, C3826 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | - C3825: Fusing abnormally low temperature detection (Main of the heating roller) <br> - C3826: Fusing abnormally low temperature detection (Center of the heating roller) |
| :---: | :---: |
| Rank | A |
| Trouble detection condition | - C3825: The heating roller temperature sensor (TEMS) continues to detect a temperature lower than a predetermined one for a predetermined period of time. <br> - C3826: The heating roller thermistor/2 (TH2) continues to detect a temperature lower than a predetermined one for a predetermined period of time. |
| Trouble isolation | - |
| Relevant electrical parts | - Fusing unit <br> - C3825: Heating roller temperature sensor (TEMS) <br> - C3826: Heating roller thermistor/2 (TH2) <br> - MFP board (MFPB) |

## (2) Procedure

1. Check the fusing unit for correct installation (whether it is secured in position).
2. Check the open/close operation of the right door.
3. Check the fusing unit and MFPB for proper connection and correct or change as necessary.
4. Replace the fusing unit.
5. Replace MFPB.

### 3.13.8 C3922, C3925, C3926 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | - C3922: Fusing sensor wire breaks detection (Edge of the heating roller) <br> - C3925: Fusing sensor wire breaks detection (Main of the heating roller) <br> - C3926: Fusing sensor wire breaks detection (Center of the heating roller) |
| :---: | :---: |
| Rank | A |
| Trouble detection condition | - C3922: After a predetermined period of time after the warm-up stage is started, the heating roller thermistor/1 (TH1) voltage does not decrease by predetermined steps (temperature rise) within a predetermined period of time. <br> - C3925: After a predetermined period of time after the warm-up stage is started, the heating roller temperature sensor (TEMS) voltage does not increase by predetermined steps (temperature rise) within a predetermined period of time. <br> - C3926: After a predetermined period of time after the warm-up stage is started, the heating roller thermistor/2 (TH2) voltage does not decrease by predetermined steps (temperature rise) within a predetermined period of time. |
| Trouble isolation | - |
| Relevant electrical parts | - Fusing unit <br> - C3922: Heating roller thermistor/1 (TH1) <br> - C3925: Heating roller temperature sensor (TEMS) <br> - C3926: Heating roller thermistor/2 (TH2) <br> - MFP board (MFPB) |

## (2) Procedure

1. Check the fusing unit for correct installation (whether it is secured in position).
2. Check the open/close operation of the right door.
3. Check the fusing unit and MFPB for proper connection and correct or change as necessary.
4. Replace the fusing unit.
5. Replace MFPB.

### 3.13.9 C392A (bizhub C368/C308/C258)

(1) Contents

| Trouble type | C392A: Heating roller temperature sensor contamination (Main of the heating roller) |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | When the machine is in standby mode after a predetermined period of time after the warm-up stage is started, <br> detected temperature of the heating roller temperature sensor (TEMS) higher than a given temperature for a <br> given period of time consecutively. |
| Trouble isolation | - |
| Relevant electrical parts | - Fusing unit <br> - Heating roller temperature sensor (TEMS) <br> - MFP board (MFPB) |

## (2) Procedure

1. Wipe the TEMS clean of dirt if any.
<Cleaning procedure>

- Clear away a dirt or a foreign object on the sensor with a cotton swab.
- When a dirt is left even if you cleaned the sensor by above procedure, clear away a dirt or a foreign object on the sensor using a cotton swab dampened with the alcohol. And, wipe off the sensor with a dry cotton swab afterwards.

2. Check the TEMS for installed position and proper connector connection.
3. Check the connection of the fusing unit.
4. Check the fusing unit and MFPB for proper connection and correct or change as necessary.
5. Replace the fusing unit.
6. Replace MFPB.

### 3.13.10 C392B (bizhub C368/C308/C258)

## (1) Contents

| Trouble type | C392B: Fusing sensor wire breaks detection (Difference of temperature) |
| :--- | :--- |
| Rank | A |
| Trouble detection condition | The difference between the temperature corrected by the heating roller thermistor/1 (TH1) and the temperature <br> detected by the heating roller thermistor/2 (TH2) exceeds a predetermined value. |
| Trouble isolation | - |
| Relevant electrical parts | - Fusing unit <br> - Heating roller thermistor/1 (TH1) <br> - Heating roller thermistor/2 (TH2) <br> - MFP board (MFPB) |

## (2) Procedure

1. Check the fusing unit for correct installation (whether it is secured in position).
2. Check the open/close operation of the right door.
3. Check the fusing unit and MFPB for proper connection and correct or change as necessary.
4. Replace the fusing unit.
5. Replace MFPB.

### 3.14 C3\#\#\# (bizhub C658/C558/C458)

### 3.14.1 C3101, C3103 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | - C3101: Pressure roller pressure failure <br> - C3103: Pressure roller release failure |
| :---: | :---: |
| Rank | B |
| Trouble detection condition | C3101: <br> - The encoder pulse does not change even after the lapse of a predetermined period of time after the fusing pressure motor (M11) has started rotating during pressure by the pressure roller. <br> - The fusing pressure home sensor (PS38) is not blocked even after the lapse of a predetermined period of time after the fusing pressure motor (M11) has started rotating during pressure by the pressure roller. |
|  | C3103: <br> - The encoder pulse does not change even after the lapse of a predetermined period of time after the fusing pressure motor (M11) has started rotating during retraction of the pressure roller. <br> - The fusing pressure home sensor (PS38) is not unblocked even after the lapse of a predetermined period of time after the fusing pressure motor (M11) has started rotating during retraction of the pressure roller. |
| Trouble isolation | - |
| Relevant electrical parts | - Fusing unit <br> - Fusing pressure motor (M11) <br> - Fusing pressure home sensor (PS38) <br> - MFP board (MFPB) |

## (2) Procedure

1. Check the connector between M11-relay CN112-MFPB CN15E for proper connection and correct as necessary.
2. Check the connector between the fusing unit-relay CN96-MFPB CN22E for proper connection and correct as necessary. (bizhub C658/ C558)
3. Check the connector between the fusing unit-relay CN104-MFPB CN12E for proper connection and correct as necessary. (bizhub C458)
4. PS38 I/O check, sensor check

- Control signal: C658/C558 MFPB CN22E-9 (ON), C458 MFPB CN12E-12 (ON)
- Location of electrical component: C658/C558 22-C, C458 24-C

5. M11 operation check

- Control signal: MFPB CN15E<A>-7 to 10
- Location of electrical component: C658/C558 16-C, C458 19-C

6. Replace M11.
7. Replace the fusing unit. (bizhub C658/C558 / bizhub C458)
8. Replace MFPB.

## NOTICE

- Link to the wiring diagram ( N. 2 bizhub C658/C558/C458)

### 3.14.2 C3102 (bizhub C658/C558/C458)

## (1) Contents

| Trouble type | C3102: Heating roller failure to turn (bizhub C658/C558) |
| :--- | :--- |
| Rank | A |
| Trouble detection condition | The hard latch signal from one or both of the heating roller rotation latch detection 1 and the heating roller <br> rotation latch detection 2 is turned ON. |
| Trouble isolation | - |
| Relevant electrical parts | - Fusing unit <br> - Heating roller rotation sensor (PS37) <br> - Fusing motor (M3) <br> - MFP board (MFPB) |

## (2) Procedure

1. Check the fusing unit for proper installation and correct as necessary.
2. Check the connector between M3-MFPB CN14E for proper connection and correct as necessary.
3. Check the connector of M3 for proper drive coupling and correct as necessary.
4. Check the connector between the fusing unit-relay CN100-MFPB CN13E for proper connection and correct as necessary.
5. PS37 I/O check, sensor check

- Control signal: MFPB CN13E-3 (ON)
- Location of electrical component: 23-C

6. M3 operation check

- Control signal: MFPB CN14E-9 (REM), MFPB CN14E-12 (LOCK)
- Location of electrical component: 2-C

7. Replace M3
8. Replace the fusing unit. (bizhub C658/C558 / bizhub C458)
9. Replace MFPB.

NOTICE

- Link to the wiring diagram ( N. 2 bizhub C658/C558/C458)

### 3.14.3 C3201, C3202 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | - C3201: Fusing motor's failure to turn <br> - C3202: Fusing motor's turning at abnormal timing |
| :---: | :---: |
| Rank | B |
| Trouble detection condition | - C3201: The motor lock signal remains HIGH for a predetermined continuous period of time while the motor is turning. <br> - C3202: The motor lock signal remains LOW for a predetermined continuous period of time while the motor remains stationary. |
| Trouble isolation | - |
| Relevant electrical parts | - Fusing motor (M3) <br> - MFP board (MFPB) |

## (2) Procedure

1. Check the connector between M3-MFPB CN14E for proper connection and correct as necessary.
2. Check the loading status of the fusing unit drive, and correct the error as necessary.
3. M3 operation check

- Control signal: MFPB CN14E-9 (REM), MFPB CN14E-12 (LOCK)
- Location of electrical component: 2-C

4. Replace M3.
5. Replace MFPB.

NOTICE

| :---: | :---: |
| Rank | A |
| Trouble detection condition | - C3922: After a predetermined period of time after the warm-up stage is started, the heating roller temperature sensor2 (TEMS/2) or heating roller thermistor1 (TH1) voltage does not decrease by predetermined steps (temperature rise) within a predetermined period of time. <br> - C3925: After a predetermined period of time after the warm-up stage is started, the heating roller temperature sensor1 (TEMS/1) voltage does not increase by predetermined steps (temperature rise) within a predetermined period of time. <br> - C3926: After a predetermined period of time after the warm-up stage is started, the heating roller thermistor2 (TH2) voltage does not decrease by predetermined steps (temperature rise) within a predetermined period of time. |
| Trouble isolation | - |
| Relevant electrical parts | - Fusing unit <br> - C3922 (bizhub C658): Heating roller temperature sensor2 (TEMS/2) <br> - C3922 (bizhub C558/C458): Heating roller thermistor1 (TH1) <br> - C3925 (bizhub C658/C558): Heating roller temperature sensor1 (TEMS/1) <br> - C3925 (bizhub C458): Heating roller thermistor1 (TH1) <br> - C3926: Heating roller thermistor2 (TH2) <br> - IH power supply (IHPU) (bizhub C658/C558/C458 only) <br> - MFP board (MFPB) |

## (2) Procedure

1. Check the fusing unit for correct installation (whether it is secured in position).
2. Check the open/close operation of the right door.
3. Check the fusing unit-MFPB CN22E for proper connection and correct or change as necessary. (bizhub C658/C558)
4. Check the fusing unit-MFPB CN12E for proper connection and correct or change as necessary. (bizhub C458)
5. Check the connector between TEMS/1-relay CN109-MFPB CN15E for proper connection and correct as necessary. (bizhub C658/C558)
6. Check the connector between TEMS/2-relay CN138-MFPB CN15E for proper connection and correct as necessary. (bizhub C658/C558)
7. Replace the fusing unit. (bizhub C658/C558 / bizhub C458)
8. Replace IHPU. (bizhub C658/C558 only)
9. MFPB F12E conduction check
10. Replace MFPB.

### 3.14.10 C392A (bizhub C658/C558/C458)

## (1) Contents

| Trouble type | C392A: Heating roller temperature sensor contamination (Main of the heating roller) |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | During waiting after a predetermined period of time after the warm-up stage terminates, the temperature <br> detected by the heating roller thermostat3 (TH3) exceeds that detected by the heating roller temperature <br> sensor1 (TEMS/1) above a predetermined temperature, and this state continues for a predetermined period of <br> time. |
| Trouble isolation | - |
| Relevant electrical parts | - Fusing unit <br> - Heating roller temperature sensor1 (TEMS/1) <br> - Heating roller thermistor3 (TH3) <br> - MFP board (MFPB) |

## (2) Procedure

1. Wipe the TEMS/1 clean of dirt if any.
<Cleaning procedure>

- Clear away a dirt or a foreign object on the sensor with a cotton swab.
- When a dirt is left even if you cleaned the sensor by above procedure, clear away a dirt or a foreign object on the sensor using a cotton swab dampened with the alcohol. And, wipe off the sensor with a dry cotton swab afterwards.

2. Check the TEMS/1 for installed position and proper connector connection.
3. Check the connection of the fusing unit.
4. Check the fusing unit-MFPB CN22E for proper connection and correct or change as necessary.
5. Check the connector between TEMS/1-relay CN109-MFPB CN15E for proper connection and correct as necessary.
6. Replace the fusing unit.
7. Replace MFPB.

### 3.14.11 C392B (bizhub C658/C558/C458)

(1) Contents

| Trouble type | C392B: Fusing sensor wire breaks detection (Difference of temperature) |
| :--- | :--- |

| Rank | A |
| :--- | :--- |
| Trouble detection condition | The difference between the temperature corrected by the heating roller thermistor1 (TH1) and the temperature <br> detected by the heating roller thermistor2 (TH2) exceeds a predetermined value. |
| Trouble isolation | - |
| Relevant electrical parts | - Fusing unit <br> - Heating roller thermistor1 (TH1) <br> - Heating roller thermistor2 (TH2) <br> - MFP board (MFPB) |

## (2) Procedure

1. Check the fusing unit for correct installation (whether it is secured in position).
2. Check the open/close operation of the right door.
3. Check the fusing unit-MFPB CN22E for proper connection and correct or change as necessary. (bizhub C658/C558)
4. Check the fusing unit-MFPB CN12E for proper connection and correct or change as necessary. (bizhub C458)
5. Replace the fusing unit. (bizhub C658/C558 / bizhub C458)
6. Replace MFPB.

### 3.14.12 C3B02, C3B03 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | - C3B02: IH malfunction (CPU) (bizhub C658/C558) <br> - C3B03: IH malfunction (monitor) (bizhub C658/C558) |
| :---: | :---: |
| Rank | A |
| Trouble detection condition | - C3B02: A failure in communication with the fusing CPU continues for a predetermined period of time. <br> - C3B03: Though the IH heater is OFF, mechanically, the ON status is detected. (Malfunction of IH heater operation) |
| Trouble isolation | - |
| Relevant electrical parts | - Fusing unit <br> - IH coil (IHC) <br> - IH power supply (IHPU) <br> - IH magnetic erasing board (IHMEB) <br> - NF board (NFB) <br> - MFP board (MFPB) |

## (2) Procedure

1. Check the fusing unit for correct installation (whether it is secured in position).
2. Check the open/close operation of the right door.
3. Check the fusing unit-MFPB CN22E for proper connection and correct or change as necessary.
4. Check the connector between MFPB CN13E-NFB CN3 for proper connection and correct as necessary.
5. Check the connector between NFB CN2-IHPU CN1 for proper connection and correct as necessary.
6. Check the connector between IHPU-IHC for proper connection and correct as necessary.
7. Check the connector between IHC-IHMEB for proper connection and correct as necessary.
8. Replace the fusing unit.
9. Replace IHC.
10. Replace IHPU.
11. Replace IHMEB.
12. Replace MFPB.
13. Replace NFB.

### 3.14.13 C3B07, C3B08 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | - C3B07: IH input power error <br> - C3B08: IH input voltage error |
| :---: | :---: |
| Rank | $\begin{aligned} & \text { C3B07: A } \\ & \text { C3B08: B } \end{aligned}$ |
| Trouble detection condition | C3B07: <br> - While the IH heater was ON, input power stayed at the high voltage power detection value or over for more than the predetermined period of time. <br> - While the IH heater was ON, input power was at the low power detection value or under for more than the predetermined period of time. <br> - While the IH heater was ON, input power was at the high voltage detection value or over for more than the predetermined period of time. <br> - While the IH heater was ON, input power was below the low voltage detection value or under for more than the predetermined period of time. <br> - While the IH heater was ON, inverter power stayed at the upper limit value or over for more than the predetermined period of time. <br> - While the IH heater was ON, output voltage halt was detected. |
|  | C3B08: <br> - While the IH heater was ON, input power was at the high voltage detection value or over for more than the predetermined period of time. <br> - While the IH heater was ON, input voltage was at the low power detection value or under for more than the predetermined period of time. |

| Trouble isolation | - |
| :--- | :--- |
| Relevant electrical parts | - Fusing unit |
|  | - IH coil (IHC) |
|  | - IH power supply (IHPU) |
|  | - NF board (NFB) |
|  | - MFP board (MFPB) |

## (2) Procedure

1. Check the fusing unit for correct installation (whether it is secured in position).
2. Check the fusing unit-MFPB CN22E for proper connection and correct or change as necessary.
3. Check the connector between NFB CN2-IHPU CN1 for proper connection and correct as necessary.
4. Check the connector between IHPU CN8-MFPB CN3E for proper connection and correct as necessary.
5. Check the marketing area of the fusing unit. If the marketing area is incorrect, replace the fusing unit for proper marketing area.
6. Check the marketing area of IHPU. If the marketing area is incorrect, replace IHPU for proper marketing area.
7. Replace IHC.
8. Replace IHPU.
9. Replace MFPB.
10. Replace NFB.

### 3.14.14 C3B09 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | C3B09: IH communication error |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | No signal has been received from the fusing CPU a predetermined number of consecutive times. |
| Trouble isolation | - |
| Relevant electrical parts | - Fusing unit |
|  | - IH coil (IHC) |
|  | - IH power supply (IHPU) |
|  | - IH magnetic erasing board (IHMEB) |
|  | - NF board (NFB) |
|  | - MFP board (MFPB) |

## (2) Procedure

1. Check the fusing unit for correct installation (whether it is secured in position).
2. Check the open/close operation of the right door.
3. Check the fusing unit-MFPB CN22E for proper connection and correct or change as necessary.
4. Check the connector between MFPB CN13E-NFB CN3 for proper connection and correct as necessary.
5. Check the connector between NFB CN2-IHPU CN1 for proper connection and correct as necessary.
6. Check the connector between IHPU-IHC for proper connection and correct as necessary.
7. Check the connector between IHC-IHMEB for proper connection and correct as necessary.
8. Replace the fusing unit.
9. Replace IHC.
10. Replace IHPU.
11. Replace IHMEB.
12. Replace MFPB.
13. Replace NFB.

### 3.15 C4\#\#\#

### 3.15.1 C4091 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | C4091: I/F communication error |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | Communication between the controller control unit and the engine control unit is not completed even after the <br> lapse of a predetermined period of time. |
| Trouble isolation | - |
| Relevant electrical parts | MFP board (MFPB) |

## (2) Procedure

1. Reboot the machine.
2. Replace MFPB.

### 3.15.2 C40A1, C40A2, C40A3, C40A4, C40C3, C40C5 (bizhub C658/C558/C458/C368/C308/C258)

## (1) Contents

| Trouble type | - C40A1: Mechanical controller sub-CPU communication error |
| :--- | :--- |
|  | - C40A2: Mechanical controller PF communication data error |
|  | - C40A3: Mechanical controller PF transmission timeout |
|  | - C40A4: Mechanical controller PF communication pulse error |
|  | - C40C3: CTL PDF transmission timeout 1 |
|  |  |

| Rank | C |
| :--- | :--- |
| Trouble detection condition | A CPU communication error is detected. |
| Trouble isolation | - |
| Relevant electrical parts | MFP board (MFPB) |

## (2) Procedure

1. Turn OFF the main power switch, disconnect and then connect the power cord. Wait for 10 sec . or more after connect the power cord, and turn ON the main power switch.
2. Rewrite the firmware.
3. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

### 3.15.3 C4101 (bizhub C658/C558/C458/C368/C308/C258)

## (1) Contents

| Trouble type | C4101: Polygon motor's rotation trouble |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | - The polygon motor fails to turn stably even after the lapse of a given period of time after activating and <br> changing rotation speed the polygon motor. <br> - Motor lock signal detects HIGH for a given period time consecutively during the polygon motor is rotating. |
| Trouble isolation | - |
| Relevant electrical parts | - PH unit <br> - Front side board (FRB) <br> - MFP board (MFPB) |

## (2) Procedure

1. Check the connector between the PH unit-FRB CN17 for proper connection and correct as necessary. (bizhub C368/C308/C258)
2. Check the connector between the PH unit-FRB CN5 for proper connection and correct as necessary. (bizhub C658/C558/C458)
3. Replace the PH unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
4. FRB fuse conduction check
5. Replace FRB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
6. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

### 3.15.4 C4501 (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | C4501: Laser malfunction |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | • SOS signal is not detected even after the lapse of a given period of time after starting the laser output. <br>  <br>  <br> • SOS signal is not detected for a given period of time during printing or IDC sensor adjustment. |
| Trouble isolation | - |
| Relevant electrical parts | - PH unit |

## (2) Procedure

1. Check the connector between the PH unit-relay CN63-MFPB CN20E for proper connection and correct as necessary.
2. Replace the PH unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
3. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

### 3.16 C5\#\#\# (bizhub C368/C308/C258)

### 3.16.1 C5102, C5103 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | - C5102: Transport motor failure to turn <br> - C5103: Transport motor turning at abnormal timing |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | - C5102: The motor lock signal remains HIGH for a predetermined continuous period of time while the motor <br> is turning. <br> C5103: The motor lock signal remains LOW for a predetermined continuous period of time while the motor <br> remains stationary. |
| Trouble isolation | $-\quad$- Transport motor (M1) |
| Relevant electrical parts | - MFP board (MFPB) |

## (2) Procedure

1. Check the connector between M1-MFPB CN8E for proper connection and correct as necessary.
2. Check the loading status of the transfer belt drive, and correct the error as necessary
3. M1 operation check

- Control signal: MFPB CN8E-3 (REM), MFPB CN8E-6 (LOCK)
- Location of electrical component: 2-C

4. Replace M1.
5. Replace MFPB.

NOTICE

- Link to the wiring diagram ( N. 1 bizhub C368/C308/C258)

### 3.16.2 C5351 (bizhub C368/C308/C258)

## (1) Contents

| Trouble type | C5351: Power supply cooling fan motor failure to turn |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | The fan lock signal remains HIGH for a predetermined continuous period of time while the fan is turning. |
| Trouble isolation | - |
| Relevant electrical parts | - Power supply cooling fan (FM1) |

## (2) Procedure

1. Check the connector between FM1-relay CN26-MFPB CN24EA for proper connection and correct as necessary.
2. Check the fan for possible overload and correct as necessary.
3. FM1 operation check

- Control signal: MFPB CN24EA-9 (REM), MFPB CN24EA-11 (LOCK)
- Location of electrical component: 25-J

4. Replace FM1.
5. Replace MFPB.

NOTICE

- Link to the wiring diagram ( N. 1 bizhub C368/C308/C258)

### 3.16.3 C5355 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | C5355: Toner cartridge cooling fan failure to turn |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | The fan lock signal remains HIGH for a predetermined continuous period of time while the fan is turning. |
| Trouble isolation | - |
| Relevant electrical parts | - Toner cartridge cooling fan (FM4) <br>  |

## (2) Procedure

1. Check the connector between FM4-relay CN157-MFPB CN15EB for proper connection and correct as necessary.
2. Check the fan for possible overload and correct as necessary.
3. FM4 operation check

- Control signal: MFPB CN15EB-6 (REM), MFPB CN15EB-8 (LOCK)
- Location of electrical component: 9-C

4. Replace FM4.
5. Replace MFPB.

NOTICE

- Link to the wiring diagram ( N. 1 bizhub C368/C308/C258)

### 3.16.4 C5360 (bizhub C368/C308/C258)

## (1) Contents

| Trouble type | C5360: Clean unit fan failure to turn (When CU-101 is installed) |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | The fan lock signal remains HIGH for a predetermined continuous period of time while the fan is turning. |
| Trouble isolation | - |
| Relevant electrical parts | - Exhaust fan/1 (FM14) <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br> -- Suction fan (FM16) <br> - MFP board (MFPB) |

## (2) Procedure

1. Check the connector between CUDB CN1-MFPB CN32E for proper connection and correct as necessary.
2. Check the connector between FM14-CUDB CN3, FM15-CUDB CN2, FM16-relay CN183-CUDB CN4 for proper connection and correct as necessary.
3. Check the fan for possible overload and correct as necessary.
4. FM14, FM15, FM16 operation check

- Load check: Check code42, Multi code 4
- Control signal: CUDB CN3 (FM14), CUDB CN2 (FM15), CUDB CN4 (FM16)
- Location of electrical component: 14-X

5. Replace the defective fan. (FM14 / FM15 / FM16)
6. Replace CUDB.
7. MFPB ICP14E conduction check
8. Replace MFPB.

## NOTICE

### 3.16.6 C5501 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | C5501: AC signal abnormality |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | The zero cross signal is not input during fusing phase control. |
| Trouble isolation | - |
| Relevant electrical parts | - Fusing unit <br>  <br>  <br>  |

## (2) Procedure

1. Check the fusing unit for correct installation (whether it is secured in position).
2. Check the fusing unit and DCPU for proper connection and correct or change as necessary.
3. Replace the fusing unit.
4. Replace MFPB.
5. Replace DCPU.

### 3.16.7 C5601 (bizhub C368/C308/C258)

## (1) Contents

| Trouble type | C5601: Engine control malfunction |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | Engine control malfunction is detected with port monitor control. |
| Trouble isolation | - |
| Relevant electrical parts | MFP board (MFPB) |

## (2) Procedure

1. Check the connectors on MFPB for proper connection and correct as necessary.
2. Rewrite the firmware.
3. Replace MFPB.

### 3.16.8 C5603 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | C5603: Front side board communication error |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | Communication error is detected in front side board. |
| Trouble isolation | - |
| Relevant electrical parts | • Front side board (FRB) <br>  <br> • PH unit <br>  MFP board (MFPB) |

## (2) Procedure

1. Reboot the machine.
2. Check the connector between FRB CN5-PH unit for proper connection and correct as necessary.
3. Check the connector between FRB CN2-MFPB CN10E for proper connection and correct as necessary.
4. Replace FRB.
5. Replace the PH unit.
6. MFPB ICP8E conduction check
7. Replace MFPB.

### 3.16.9 C5604 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | C5604: PH configuration fault |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | A disagreement in PH unit configuration is detected. |
| Trouble isolation | - |
| Relevant electrical parts | • PH unit <br>  |

## (2) Procedure

1. Check the type of the installed PH unit and replace it if it is a wrong one.
2. Check the connector between the PH unit-MFPB for proper connection and correct as necessary.
3. Replace MFPB.

### 3.16.10 C5605, C5606 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | • C5605: Engine communication data error <br> •C5606: Engine transmission timeout |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | A communication error is detected between CPUs. |
| Trouble isolation | - |
| Relevant electrical parts | MFP board (MFPB) |

## (2) Procedure

1. Turn OFF the main power switch, disconnect and then connect the power cord. Wait for 10 sec . or more after connect the power cord, and turn ON the main power switch.
2. Rewrite the firmware.
3. MFPB ICP8E conduction check
4. Replace MFPB.

### 3.16.11 C5610 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | C5610: PH LD drive communication error |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | LD drive write data and read data disagree with each other a predetermined number of consecutive times. |
| Trouble isolation | - |
| Relevant electrical parts | • Front side board (FRB) <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br> • PH unit |

## (2) Procedure

1. Reboot the machine.
2. Check the connector between FRB CN5-PH unit for proper connection and correct as necessary.
3. Check the connector between FRB CN2-MFPB CN10E for proper connection and correct as necessary.
4. Replace FRB.
5. Replace the PH unit.
6. Replace MFPB.

### 3.16.12 C5611 (bizhub C368/C308/C258)

## (1) Contents

| Trouble type | C5611: PH EEPROM communication error |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | Results of two readings of the EEPROM data disagree with each other. |
| Trouble isolation | - |
| Relevant electrical parts | • Front side board (FRB) <br>  <br>  <br>  <br>  <br> • PH unit <br> •MFP board (MFPB) |

## (2) Procedure

1. Reboot the machine.
2. Check the connector between FRB CN5-PH unit for proper connection and correct as necessary.
3. Check the connector between FRB CN2-MFPB CN10E for proper connection and correct as necessary.
4. Replace FRB.
5. Replace the PH unit.
6. Replace MFPB.

### 3.17 C5\#\#\# (bizhub C658/C558/C458)

### 3.17.1 C5102, C5103 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | - C5102: Transport motor's failure to turn <br> - C5103: Transport motor's turning at abnormal timing |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | - C5102: The motor lock signal remains HIGH for a predetermined continuous period of time while the motor <br> is turning. <br> C5103: The motor lock signal remains LOW for a predetermined continuous period of time while the motor <br> remains stationary. |
| Trouble isolation | $-\quad$. |
| Relevant electrical parts | - Transport motor (M1) <br> - MFP board (MFPB) |

## (2) Procedure

1. Check the connector between M1-MFPB CN14E for proper connection and correct as necessary.
2. Check the loading status of the transfer belt drive, and correct the error as necessary.
3. M1 operation check

- Control signal: MFPB CN14E-3 (REM), MFPB CN14E-6 (LOCK)
- Location of electrical component: 1-C

4. Replace M1.
5. Replace MFPB.

### 3.17.2 C5304 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | C5304: Fusing power supply cooling fan's failure to turn (bizhub C658/C558) |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | The fan lock signal remains HIGH for a predetermined continuous period of time while the fan is turning. |
| Trouble isolation | - |
| Relevant electrical parts | - Fusing power supply cooling fan (FM12) |

(2) Procedure

1. Check the connector between FM12-relay CN146-MFPB CN15E for proper connection and correct as necessary.
2. Check the fan for possible overload and correct as necessary.
3. FM12 operation check

- Control signal: MFPB CN15E<A>-16 (REM), MFPB CN15E<A>-18 (LOCK)
- Location of electrical component: C658/C558 16-C, C458 20-C

4. Replace FM12.
5. Replace MFPB.

NOTICE

- Link to the wiring diagram ( N. 2 bizhub C658/C558/C458)

### 3.17.3 C5306 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | C5306: IH coil cooling fan's failure to turn (bizhub C658/C558) |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | The fan lock signal remains HIGH for a predetermined continuous period of time while the fan is turning. |
| Trouble isolation | - |
| Relevant electrical parts | - IH coil cooling fan (FM7) <br>  <br>  <br>  |

## (2) Procedure

1. Check the connector between FM7-relay CN77-EXCB CN3 for proper connection and correct as necessary

Check the fan for possible overload and correct as necessary.
3. FM7 operation check

- Control signal: EXCB CN3-1 (REM), EXCB CN3-3 (LOCK)
- Location of electrical component: 26-T

4. Replace FM7.
5. Replace EXCB.
6. MFPB F6E conduction check
7. Replace MFPB.

NOTICE

- Link to the wiring diagram ( N. 2 bizhub C658/C558/C458)

### 3.17.4 C5351 (bizhub C658/C558/C458)

## (1) Contents

| Trouble type | C5351: Power supply cooling fan's failure to turn |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | The fan lock signal remains HIGH for a predetermined continuous period of time while the fan is turning. |
| Trouble isolation | - |
| Relevant electrical parts | - Power supply cooling fan (FM1) |

## (2) Procedure

1. Check the connector between FM1-relay CN26-MFPB CN31E for proper connection and correct as necessary.
2. Check the fan for possible overload and correct as necessary.
3. FM1 operation check

- Control signal: MFPB CN31E<A>-9 (REM), MFPB CN31E<A>-11 (LOCK)
- Location of electrical component: 23-J

4. Replace FM1.
5. Replace MFPB.

NOTICE

- Link to the wiring diagram ( N. 2 bizhub C658/C558/C458)

### 3.17.5 C5355 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | C5355: Toner cartridge cooling fan's failure to turn |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | The fan lock signal remains HIGH for a predetermined continuous period of time while the fan is turning. |
| Trouble isolation | - |
| Relevant electrical parts | - Toner cartridge cooling fan (FM4) <br>  <br>  <br>  <br> - Expansion control board (EXCB) |

## (2) Procedure

(a) bizhub C658/C558
. Check the connector between FM4-relay CN78-EXCB CN10 for proper connection and correct as necessary.
. Check the fan for possible overload and correct as necessary.
3. FM4 operation check

- Control signal: EXCB CN10-1 (REM), EXCB CN10-3 (LOCK)
- Location of electrical component: 27-T

4. Replace FM4.
5. Replace EXCB.
6. MFPB F6E or F8E conduction check
7. Replace MFPB.

NOTICE

- Link to the wiring diagram ( N. 2 bizhub C658/C558/C458)
(b) bizhub C458

1. Check the connector between FM4-relay CN111-MFPB CN16E for proper connection and correct as necessary.
2. Check the fan for possible overload and correct as necessary.
3. FM4 operation check

- Control signal: MFPB CN16E-2 (REM), MFPB CN16E-3 (LOCK)
- Location of electrical component: 26-C

4. Replace FM4.
5. Replace MFPB.

NOTICE

- Link to the wiring diagram ( N. 2 bizhub C658/C558/C458)

### 3.17.6 C5358 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | C5358: Fusing power supply cooling fan's failure to turn (bizhub C458) |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | The fan lock signal remains HIGH for a predetermined continuous period of time while the fan is turning. |
| Trouble isolation | - |

| Relevant electrical parts | - Fusing power supply cooling fan (FM12) |
| :--- | :--- |
|  | - MFP board (MFPB) |

## (2) Procedure

1. Check the connector between FM12-relay CN146-MFPB CN15E for proper connection and correct as necessary.
2. Check the fan for possible overload and correct as necessary.
3. FM12 operation check

- Control signal: MFPB CN15E<A>-16 (REM), MFPB CN15E<A>-18 (LOCK)
- Location of electrical component: C658/C558 16-C, C458 20-C

4. Replace FM12.
5. Replace MFPB.

NOTICE

### 3.17.7 C5360 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | C5360: Clean unit fan's failure to turn (When CU-102 is installed) |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | The fan lock signal remains HIGH for a predetermined continuous period of time while the fan is turning. |
| Trouble isolation | - |
| Relevant electrical parts | - Exhaust fan1 (FM14) <br>  <br>  <br>  <br>  <br>  <br>  <br> - Exhaust fan2 (FM15) <br> - MFP board (MFPB) (Clean unit drive board (CUDB) |

## (2) Procedure

1. Check the connector between CUDB CN1-MFPB CN29E for proper connection and correct as necessary.
2. Check the connector between FM14-relay CN200-CUDB CN2 for proper connection and correct as necessary.
3. Check the connector between FM15-relay CN201-CUDB CN3 for proper connection and correct as necessary.
4. Check the fan for possible overload and correct as necessary.
5. FM14 operation check

- Load check: Check code42, Multi code 9
- Control signal: CUDB CN2-1 (REM), CUDB CN2-3 (LOCK)
- Location of electrical component: 15-K

6. FM15 operation check

- Load check: Check code42, Multi code 9
- Control signal: CUDB CN3-1 (REM), CUDB CN3-3 (LOCK)
- Location of electrical component: 15-K

7. Replace the defective fan. (FM14 / FM15)
8. Replace CUDB.
9. MFPB F3E conduction check
10. Replace MFPB.

### 3.17.10 C5501 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | C5501: AC signal abnormality |
| :---: | :---: |
| Rank | C |
| Trouble detection condition | The zero cross signal is not input during fusing phase control. |
| Trouble isolation | - |
| Relevant electrical parts | - Fusing unit <br> - Fusing power supply (FUPU) (bizhub C458 only) <br> - DC power supply (DCPU) <br> - MFP board (MFPB) |

## (2) Procedure

1. Check the fusing unit for correct installation (whether it is secured in position).
2. Check the fusing unit, FUPU, DCPU, and MFPB for proper connection and correct or change as necessary.
3. Replace the fusing unit. (bizhub C658/C558 / bizhub C458)
4. Replace MFPB.
5. Replace FUPU. (bizhub C458 only)
6. Replace DCPU.

### 3.17.11 C5601 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | C5601: Engine control malfunction |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | Engine control malfunction is detected with port monitor control. |
| Trouble isolation | - |
| Relevant electrical parts | MFP board (MFPB) |

## (2) Procedure

1. Check the connectors on MFPB for proper connection and correct as necessary.
2. Rewrite the firmware.
3. Replace MFPB.

### 3.17.12 C5603 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | C5603: Front side board communication error |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | Communication error is detected in front side board. |
| Trouble isolation | - |
| Relevant electrical parts | • Front side board (FRB) <br>  <br>  <br>  <br>  <br>  <br>  •PH unit |

## (2) Procedure

1. Reboot the machine.
2. Check the connector between FRB CN5-PH unit for proper connection and correct as necessary.
3. Check the connector between FRB CN2-MFPB CN8E for proper connection and correct as necessary.
4. Replace FRB
5. Replace the PH unit.
6. MFPB F10E conduction check
7. Replace MFPB.

### 3.17.13 C5605, C5606 (bizhub C658/C558/C458)

## (1) Contents

| Trouble type | • C5605: Engine communication data error <br> • C5606: Engine transmission timeout |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | A communication error is detected between CPUs. |
| Trouble isolation | - |
| Relevant electrical parts | MFP board (MFPB) |

## (2) Procedure

1. Turn OFF the main power switch, disconnect and then connect the power cord. Wait for 10 sec . or more after connect the power cord, and turn ON the main power switch.
2. Rewrite the firmware.
3. MFPB F10E conduction check
4. Replace MFPB.

### 3.17.14 C5610 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | C5610: PH LD drive communication error |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | LD drive write data and read data disagree with each other a predetermined number of consecutive times. |
| Trouble isolation | - |
| Relevant electrical parts | - Front side board (FRB) <br>  <br>  <br>  <br>  <br>  <br>  PH unit |

## (2) Procedure

1. Reboot the machine.
2. Check the connector between FRB CN5-PH unit for proper connection and correct as necessary.
3. Check the connector between FRB CN2-MFPB CN8E for proper connection and correct as necessary.
4. Replace FRB.
5. Replace the PH unit.
6. Replace MFPB.

### 3.18 C6\#\#\#

### 3.18.1 C6001 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | C6001: DF related configuration error 1 |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | Inconsistency in the configuration with the installed DF is detected on the main body. |
| Trouble isolation | - |
| Relevant electrical parts | - DF control board (DFCB) <br>  <br>  <br>  <br> - Dual scan image processing board (DSIPB) <br> •MFP board (MFPB) |

## (2) Procedure

1. Check the type of the installed DF and replace it if it is a wrong one.
2. Check to see the [Service mode] -> [System 2] -> [ADF Settings] is correct. It corrects, when a model is different.
3. Correct the harness connection between DFCB and DSIPB if faulty.
4. Check the connector between DSIPB CN01-MFPB CN22 for proper connection and correct as necessary.
5. Replace DFCB.
6. Replace DSIPB.
7. Replace MFPB.

### 3.18.2 C6001 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | C6001: DF related configuration error 1 |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | Inconsistency in the configuration with the installed DF is detected on the main body. |
| Trouble isolation | - |

| Relevant electrical parts | - DF control board (DFCB) |
| :--- | :--- |
|  | - Dual scan image processing board (DSIPB) |
|  | - MFP board (MFPB) |

## (2) Procedure

1. Check the type of the installed DF and replace it if it is a wrong one.
2. Check the connector between DFCB CN12-relay CN47-MFPB CN24E for proper connection and correct as necessary.
3. Check the connector between DSIPB CN1-MFPB CN24 for proper connection and correct as necessary.
4. Replace DFCB.
5. Replace DSIPB.
6. Replace MFPB.

### 3.18.3 C6002 (bizhub C658/C558/C458/C368/C308/C258)

## (1) Contents

| Trouble type | C6002: DF related configuration error 2 |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | Inconsistency in the configuration with the installed DF is detected on the main body. |
| Trouble isolation | - |
| Relevant electrical parts | • DF control board (DFCB) |

## (2) Procedure

1. Check the type of the installed DF and replace it if it is a wrong one.
2. Correct the harness connection between DFCB and DSIPB if faulty.
3. Check the connectors of the dual scan image processing board (DSIPB) for proper connection, and correct as necessary. (Direction of the point of contact and connection state of the flat cable in particular)

### 3.18.4 C6102, C6103 (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | - C6102: Drive system home sensor malfunction <br> - C6103: Slider over running |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | C6102: <br> - The scanner home sensor (PS201) is unable to detect the scanner located at its home position. <br> - The scanner home sensor (PS201) is unable to detect a scanner even when the scanner motor (M201) has <br> been driven to move the scanner over the maximum travelling distance. |
|  | The scanner home sensor (PS201) detects the scanner when the scanner has moved the maximum <br> travelling distance from the position, at which it blocks the scanner home sensor (PS201). |
|  | C6103: The scanner home sensor (PS201) detects the scanner at its home position during a period of time that <br> begins with the time when a prescan command and a scan preparation command are executed and ends when <br> a home return command is executed. |
| Trouble isolation | Scanner |
| Relevant electrical parts | - Scanner home sensor (PS201) <br> - Scanner motor (M201) <br> - Scanner drive board (SCDB) <br> - MFP board (MFPB) |

## (2) Procedure

1. Correct or change the scanner drive (pulley, gear, belt) if it is faulty.
2. Correct the scanner motor set screw if loose.
3. Adjust [Image Position: Leading Edge] and [Sub Scan Zoom Adj.].
4. Check the connector between M201-SCDB CN4 for proper connection and correct as necessary.
5. Check the connector between PS201-SCDB CN6 for proper connection and correct as necessary.
6. Check the connector between SCDB CN2-MFPB CN12E for proper connection and correct as necessary. (bizhub C368/C308/C258)
7. Check the connector between SCDB CN2-MFPB CN6E for proper connection and correct as necessary. (bizhub C658/C558/C458)
8. PS201 I/O check, sensor check

- Control signal: SCDB CN6-3 (ON)
- Location of electrical component: C368/C308/C258 25-P, C658/C558/C458 22-P

9. M201 operation check

- Control signal: SCDB CN4-1 to 4
- Location of electrical component: C368/C308/C258 25-P, C658/C558/C458 22-P

10. Replace SCDB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
11. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

## (1) Contents

| Trouble type | - C6104: Back side cleaning home sensor abnormality (initial) (When DF-704 is installed) <br> - C6105: Back side cleaning home sensor abnormality (normal) (When DF-704 is installed) |
| :---: | :---: |
| Rank | B |
| Trouble detection condition | C6104: <br> - The CIS cleaning sensor (PS7) does not change from H to L even after the lapse of a given period of time after the home position detecting operation is started at the initial operation. <br> - The CIS cleaning sensor (PS7) does not change from L to H even after the lapse of a given period of time after the home position detecting operation is started at the initial operation. |
|  | C6105: At the time of operation other than the initial operation, the CIS cleaning sensor (PS7) error is detected. |
| Trouble isolation | Scanner |
| Relevant electrical parts | - CIS cleaning sensor (PS7) <br> - CIS cleaning motor (M5) <br> - DF control board (DFCB) |

## (2) Procedure

1. Check if the opening and closing guide is firmly closed.
2. Check the connector between M5-DFCB J9 for proper connection and correct as necessary.
3. Check the connector of M 5 for proper drive coupling and correct as necessary.
4. Check the connector between PS7-DFCB J13 for proper connection and correct as necessary.
5. PS7 I/O check, sensor check

- Control signal: DFCB J13-3 (ON)
- Location of electrical component: DF-704 1-G

6. M5 operation check

- Control signal: DFCB J9-1 to 4
- Location of electrical component: DF-704 6-G

7. Replace M5.
8. Replace DFCB.

NOTICE

### 3.18.6 C6104, C6105 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | - C6104: Back side cleaning home sensor abnormality (initial) <br> - C6105: Back side cleaning home sensor abnormality (normal) |
| :---: | :---: |
| Rank | B |
| Trouble detection condition | C6104: <br> - The back side cleaning home sensor (PS9) does not change from H to L even after the lapse of a given period of time after the home position detecting operation is started at the initial operation. <br> - The back side cleaning home sensor (PS9) does not change from H to L even after the lapse of a given period of time after the home position detecting operation is started at the initial operation. |
|  | C6105: At the time of operation other than the initial operation, the back side cleaning home sensor (PS9) error is detected. |
| Trouble isolation | Scanner |
| Relevant electrical parts | - Back side cleaning home sensor (PS9) <br> - Back side cleaning motor (M7) <br> - DF control board (DFCB) |

## (2) Procedure

1. Check the connector between M7-DFCB CN14 for proper connection and correct as necessary.
2. Check the connector of $M 7$ for proper drive coupling and correct as necessary.
3. Check the connector between PS9-relay CN121-DFCB CN18 for proper connection and correct as necessary.
4. PS9 I/O check, sensor check

- Control signal: DFCB CN18-6 (ON)
- Location of electrical component: 3 to $4-\mathrm{C}$

5. M7 operation check

- Control signal: DFCB CN14-6 to 9
- Location of electrical component: 6-C

6. Replace M7
7. DFCB ICP4 or ICP8 conduction check.
8. Replace DFCB.

## (2) Procedure

(a) When DF-629 is installed

1. Check the connector between M5-DFCB J18 for proper connection and correct as necessary.
2. Check the connector of M5 for proper drive coupling and correct as necessary.
3. Check the connector between PS4-DFCB J10 for proper connection and correct as necessary.
4. PS4 I/O check, sensor check

- Control signal: DFCB J10-3 (ON)
- Location of electrical component: DF-629 2-G

5. M5 operation check

- Control signal: DFCB J18-4 to 5
- Location of electrical component: DF-629 2-G

6. Replace M5.
7. Replace DFCB.

NOTICE

- Link to the wiring diagram ( N.4.1 DF-629)
(b) When DF-704 is installed

1. Check the connector between M4-DFCB J18 for proper connection and correct as necessary.
2. Check the connector of M4 for proper drive coupling and correct as necessary.
3. Check the connector between PS6-DFCB J10 for proper connection and correct as necessary.
4. PS6 I/O check, sensor check

- Control signal: DFCB J10-3 (ON)
- Location of electrical component: DF-704 2-G

5. M4 operation check

- Control signal: DFCB J18-4 to 5
- Location of electrical component: DF-704 1-G

6. Replace M4.
7. Replace DFCB.

NOTICE

- Link to the wiring diagram ( N.4.2 DF-704)

### 3.19.2 C8107 (bizhub C368/C308/C258)

## (1) Contents

| Trouble type | C8107: Glass cleaning mechanism trouble (When DF-629 or DF-704 is installed) |
| :---: | :---: |
| Rank | B |
| Trouble detection condition | <When DF-629 is installed> <br> The document reading glass cleaning sensor (PS12) is not turned ON after the set period of time has elapsed after the glass cleaning motor (M4) is turned ON. |
|  | <When DF-704 is installed> <br> The document reading glass cleaning sensor (PS13) is not turned ON after the set period of time has elapsed after the document reading glass cleaning motor (M6) is turned ON. |
| Trouble isolation | - |
| Relevant electrical parts | <When DF-629 is installed> <br> - Glass cleaning motor (M4) <br> - Document reading glass cleaning sensor (PS12) <br> - DF control board (DFCB) |
|  | <When DF-704 is installed> <br> - Document reading glass cleaning motor (M6) <br> - Document reading glass cleaning sensor (PS13) <br> - DF control board (DFCB) |

## (2) Procedure

## (a) When DF-629 is installed

1. Check the connector between M4-DFCB J8 for proper connection and correct as necessary.
2. Check the connector of M4 for proper drive coupling and correct as necessary.
3. Check the connector between PS12-DFCB J15 for proper connection and correct as necessary.
4. PS12 I/O check, sensor check

- Control signal: DFCB J15-5 (ON)
- Location of electrical component: DF-629 3-G

5. M4 operation check

- Control signal: DFCB J8-1 to 4
- Location of electrical component: DF-629 1 to 2-B

6. Replace M4.
7. Replace DFCB.

## NOTICE

- Link to the wiring diagram ( N.4.1 DF-629)
(b) When DF-704 is installed

1. Check the connector between M6-DFCB J8 for proper connection and correct as necessary.
. Check the connector of M6 for proper drive coupling and correct as necessary.
. Check the connector between PS13-DFCB J15 for proper connection and correct as necessary.
2. PS13 I/O check, sensor check

- Control signal: DFCB J15-5 (ON)
- Location of electrical component: DF-704 3-G

5. M6 operation check

- Control signal: DFCB J8-1 to 4
- Location of electrical component: DF-704 1-B

6. Replace M6.

## 7. Replace DFCB

- Link to the wiring diagram ( N.4.2 DF-704)

### 3.19.3 C8302 (bizhub C368/C308/C258)

## (1) Contents

| Trouble type | C8302: Cooling fan trouble (When DF-629 or DF-704 is installed) |
| :---: | :---: |
| Rank | B |
| Trouble detection condition | <When DF-629 is installed> <br> - The lock signal continues to detect H during a given time while the DF cooling fan motor (FM1) is spinning. <br> - The lock signal continues to detect $L$ during a given time while the DF cooling fan motor (FM1) is during halts. |
|  | <When DF-704 is installed> <br> - The lock signal continues to detect H during a given time while the DF cooling fan motor (FM1) is spinning. <br> - The lock signal continues to detect $L$ during a given time while the DF cooling fan motor (FM1) is during halts. |
| Trouble isolation | - |
| Relevant electrical parts | <When DF-629 is installed> <br> - DF cooling fan motor (FM1) <br> - DF control board (DFCB) |
|  | <When DF-704 is installed> <br> - DF cooling fan motor (FM1) <br> - DF control board (DFCB) |

## (2) Procedure

(a) When DF-629 is installed
. Check the connector between FM1-DFCB J16 for proper connection and correct as necessary.
. Check the fan for possible overload and correct as necessary.
3. FM1 operation check

- Control signal: DFCB J16-3 (ON)
- Location of electrical component: DF-629 3-B

4. Replace FM1.
5. Replace DFCB.

NOTICE

- Link to the wiring diagram ( N.4.1 DF-629)
(b) When DF-704 is installed

1. Check the connector between FM1-DFCB J16 for proper connection and correct as necessary.
2. Check the fan for possible overload and correct as necessary.
3. FM1 operation check

- Control signal: DFCB J16-3 (ON)
- Location of electrical component: DF-704 7-G

4. Replace FM1.
5. Replace DFCB.

NOTICE

- Link to the wiring diagram ( N.4.2 DF-704)
3.19.4 C8401 (bizhub C368/C308/C258)
(1) Contents

| Trouble type | C8401: Data flash failure |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | Data flash does not access normally. |
| Trouble isolation | - |
| Relevant electrical parts | DF control board (DFCB) |

## (2) Procedure

1. Turn OFF the main power switch, disconnect and then connect the power cord. Wait for 10 sec. or more after connect the power cord, and turn ON the main power switch.
2. Check the DFCB connector for proper connection and correct as necessary.
3. Rewrite the firmware.
4. Replace DFCB. (DF-704 / DF-629)

### 3.20 C8\#\#\# (bizhub C658/C558/C458)

### 3.20.1 C8101 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | C8101: Before reading pressure welding alienation mechanism trouble |

### 3.20.3 C8106 (bizhub C658/C558/C458)

## (1) Contents

| Trouble type | C8106: Lift up mechanism failure (Downward movement) |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | The lift up lower sensor (PS3) is not turned ON (unblocked) after a lapse of a given time after the lift-up motor <br> (M5) goes down (is turned backward). |
| Trouble isolation | DF |
| Relevant electrical parts | • Lift-up motor (M5) <br>  <br>  <br> • Lift up lower sensor (PS3) <br> • DF control board (DFCB) |

## (2) Procedure

1. Check the connector between M5-DFCB CN9 for proper connection and correct as necessary.
2. Check the connector of M5 for proper drive coupling and correct as necessary.
3. Check the connector between PS3-DFCB CN10 for proper connection and correct as necessary
4. PS3 I/O check, sensor check

- Control signal: DFCB CN10-3 (ON)
- Location of electrical component: DF 10-C

5. M5 operation check

- Control signal: DFCB CN9-1 to 5
- Location of electrical component: DF 5-C

6. Replace M5.
7. Replace DFCB.

## NOTICE

- Link to the wiring diagram ( N. 3 Dual scan document feeder)

### 3.20.4 C8107 (bizhub C658/C558/C458)

## (1) Contents

| Trouble type | C8107: Glass cleaning mechanism trouble |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | The front side cleaning home sensor (PS18) is not turned ON (unblocked) even after the set period of time has <br> elapsed after the front side cleaning motor (M8) turned ON. |
| Trouble isolation | DF |
| Relevant electrical parts | • Front side cleaning motor (M8) <br> • Front side cleaning home sensor (PS18) <br> • DF control board (DFCB) |

## (2) Procedure

1. Check the connector between M8-DFCB CN14 for proper connection and correct as necessary.
2. Check the connector between PS18-DFCB CN18 for proper connection and correct as necessary.
3. Check the connector of M8 for proper drive coupling and correct as necessary.
4. PS18 I/O check, sensor check

- Control signal: DFCB CN18-3 (ON)
- Location of electrical component: DF 3-C

5. M8 operation check

- Control signal: DFCB CN14-1 to 4
- Location of electrical component: DF 6-C

6. Replace M8.
7. DFCB ICP8 conduction check.
8. Replace DFCB.

NOTICE

- Link to the wiring diagram ( N. 3 Dual scan document feeder)

### 3.20.5 C8302 (bizhub C658/C558/C458)

## (1) Contents

| Trouble type | C8302: Cooling fan motor's failure |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | The motor lock signal remains HIGH for a predetermined continuous period of time while the motor is turning. |
| Trouble isolation | DF |
| Relevant electrical parts | • Cooling fan motor (FM) <br>  |

## (2) Procedure

1. Check the connector between FM-relay CN115-DFCB CN19 for proper connection and correct as necessary.
2. Check the fan for possible overload and correct as necessary.
3. FM operation check

- Control signal: DFCB CN19-3 (LOCK)
- Location of electrical component: DF 4-C

4. Replace FM.
5. DFCB ICP10 conduction check.
6. Replace DFCB.

NOTICE

- Link to the wiring diagram ( N. 3 Dual scan document feeder)

### 3.20.6 C8401 (bizhub C658/C558/C458)

## (1) Contents

| Trouble type | C8401: Nonvolatile memory error |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | The EEPROM writing is disabled. |
| Trouble isolation | DF |
| Relevant electrical parts | DF control board (DFCB) |

## (2) Procedure

1. Turn OFF the main power switch, disconnect and then connect the power cord. Wait for 10 sec. or more after connect the power cord, and turn ON the main power switch.
2. Check the DFCB connector for proper connection and correct as necessary.
3. Rewrite the firmware.
4. Replace DFCB.

### 3.20.7 C8402 (bizhub C658/C558/C458)

## (1) Contents

| Trouble type | C8402: Multi feed detection board failure (When UK-501 is installed) |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | - The AD value went below the predetermined the HI side threshold for two consecutive times. <br> - The AD value went above the predetermined the LOW side threshold for two consecutive times. |
| Trouble isolation | DF |
| Relevant electrical parts | - Multi feed detection board/1 (transmitter) (MFDB/1) <br>  <br>  <br>  <br>  <br> - Multi feed detection board/2 (receiver) (MFDB/2) <br> - DF control board (DFCB) |

## (2) Procedure

1. Remove the film stuck on the window of the lower guide assembly.
2. Use the adjustment sheet for double feed detection kit (UK-501), and select [ADF] -> [Multi-Feed DetectionAdj.].
3. Use the misdetected paper, and select [ADF] -> [Multi-Feed DetectionAdj.].
4. Check the connector between MFDB/1-SCB CN104 for proper connection and correct as necessary.
5. Check the connector between MFDB/2-SCB CN103 for proper connection and correct as necessary.
6. Check the connector between SCB CN101-DFCB CN8 for proper connection and correct as necessary.
7. MFDB/1 operation check

- Control signal: SCB CN104
- Location of electrical component: DF 11-L

8. MFDB/2 operation check

- Control signal: SCB CN103
- Location of electrical component: DF 10-J

9. Replace SCB.
10. Replace DFCB.

NOTICE

### 3.21 C9\#\#\#

### 3.21.1 C9401, C9402 (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | - C9401: Exposure LED lighting failure <br> - C9402: Exposure LED lighting abnormally |
| :---: | :---: |
| Rank | B |
| Trouble detection condition | - C9401: The output from the CCD sensor is a predetermined value or less during CCD sensor gain adjustment. <br> - C9402: The average output value of the CCD sensor with the scanner at its standby position is a predetermined value or more at the end of a scan job. |
| Trouble isolation | Scanner |
| Relevant electrical parts | - LED exposure unit <br> - Flat cable (LED exposure unit) <br> - CCD board (CCDB) <br> - Scanner drive board (SCDB) <br> - MFP board (MFPB) |

## (2) Procedure

1. Correct the harness connection between SCDB CN3-LU201 if faulty.
2. Check the connector between SCDB CN2-MFPB CN12E for proper connection and correct as necessary. (bizhub C368/C308/C258)
3. Check the connector between SCDB CN2-MFPB CN6E for proper connection and correct as necessary. (bizhub C658/C558/C458)
4. Check the connector between CCDB CN3-MFPB CN1 for proper connection and correct as necessary. (bizhub C368/C308/C258)
5. Check the connector between CCDB PJ3-MFPB CN9 for proper connection and correct as necessary. (bizhub C658/C558/C458)
6. Replace the LED exposure unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
7. Replace CCDB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
8. Replace SCDB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
9. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

### 3.21.2 C9403, C9404 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | - C9403: CIS LED lighting failure (When DF-704 is installed) <br> - C9404: CIS LED lighting abnormally (When DF-704 is installed) |
| :--- | :--- | :--- |
| Rank | B |
| Trouble detection condition | - C9403: At the CIS gain adjustment, the machine detected that the output of the CIS LED is lower than the <br> specified value. |
|  | C9404: After a scan job is completed, the machine detected that the average output of the CIS LED is <br> greater than the specified value. |

| Trouble isolation | Scanner |
| :--- | :--- |
| Relevant electrical parts | • CIS module (CIS) |
|  | - CIS power supply (CISPU) |
|  | - Dual scan image processing board (DSIPB) |
|  | • MFP board (MFPB) |
|  | CIS cable |

## (2) Procedure

1. Check the back side scanning shading shaft for any stain, and clean up it as necessary.
2. Check that the bearing of the back side glass cleaning roller unit is on the standby position.
3. Correct the harness connection between CIS and DSIPB if faulty.
4. Correct the harness connection between CIS J222-CISPU J2 if faulty.
5. Measure the voltage of CISPU J1-1.

- Control signal: CISPU J1-1 (DC12V)
- Location of electrical component: DF-704 5-B

6. Measure the voltage of CIS J222-1, J222-2 and J222-5.

- Control signal: CIS J222-1 (DC5V), CIS J222-2 (DC5V), CIS J222-5 (DC12V)
- Location of electrical component: DF-704 4-B

7. For any abnormality in the measurement result, replace the CIS cable.
8. Replace CIS.
9. Replace CISPU.
10. Replace DSIPB.
11. Replace MFPB.

NOTICE

- Link to the wiring diagram ( N.4.2 DF-704)

### 3.21.3 C9403, C9404 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | - C9403: CIS LED lighting failure <br> - C9404: CIS LED lighting abnormally |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | - C9403: At the CIS gain adjustment, the machine detected that the output of the CIS LED is lower than the <br> -specified value. <br> C9404: After a scan job is completed, the machine detected that the average output of the CIS LED is <br> greater than the specified value. <br> Trouble isolation <br> Relevant electrical parts <br> Scanner <br> - CIS module (CIS) <br> - DF power supply (DFPU) <br> - Dual scan image processing board (DSIPB) <br> - MFP board (MFPB) |

## (2) Procedure

1. Correct the harness connection between CIS J101-DSIPB CN2 if faulty.
2. Correct the harness connection between CIS J102-DFPU CN2 if faulty.
3. Replace CIS.
4. DFPU ICP1 conduction check.
5. Replace DFPU.
6. Replace DSIPB.
7. Replace MFPB.

### 3.22 CA\#\#\#

### 3.22.1 CA051, CA052, CA053 (bizhub C658/C558/C458/C368/C308/C258)

## (1) Contents

| Trouble type | - CA051: Standard controller configuration failure <br> - CA052: Controller hardware error <br> - CA053: Controller start failure |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | - CA051: The controller of the MFP board (MFPB) is faulty. <br> - CA052: A controller hardware error is detected in the network interface. <br> - CA053: A controller start failure is detected in the controller interface. |
| Trouble isolation | - |
| Relevant electrical parts | MFP board (MFPB) |

## (2) Procedure

1. Check to see if the following setting has been correctly made: [Service Mode] -> [System 2] -> [Image Controller Setting]. If changing the setting, turn OFF the main power switch and turn it ON again after 10 seconds or more.
2. Check the connectors of the MFPB for proper connection and correct as necessary.
3. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

### 3.23 CC\#\#\#

### 3.23.1 CC140 (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | CC140: Trouble related to security |
| :--- | :--- |

| Trouble isolation | - |
| Relevant electrical parts | - |

(2) Procedure

NOTE

- Contact the responsible people of KM before taking some countermeasures.

### 3.23.2 CC151, CC152 (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | • CC151: ROM contents error upon startup (MSC) <br>  <br> •CC152: ROM contents error upon startup (IR) |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | A fault is detected in a sequence of ROM contents check of the MFPB during starting. |
| Trouble isolation | - |
| Relevant electrical parts | MFP board (MFPB) |

(2) Procedure

1. Check the ROM version.
2. Rewrite the firmware.
3. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

### 3.23.3 CC155 (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | CC155: Finisher ROM error (When FS-533, FS-534, FS-534SD, FS-536, FS-536SD, FS-537, FS-537SD, or <br> JS-506 is installed) |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | Data of flash ROM of the finishing options is determined to be faulty when the main power switch is turned ON. |
| Trouble isolation | - |
| Relevant electrical parts | <When FS-533, FS-534, FS-534SD, FS-536, FS-536SD, FS-537, or FS-537SD is installed> <br> • FS control board (FSCB) |
| <When JS-506 is installed> <br> • JS control board (JSCB) |  |

## (2) Procedure

(a) When FS-533, FS-534, FS-534SD, FS-536, FS-536SD, FS-537, or FS-537SD is installed

1. Turn OFF the main power switch, disconnect and then connect the power cord. Wait for 10 sec . or more after connect the power cord, and turn ON the main power switch.
2. Rewrite the firmware.
3. Replace FSCB. (FS-533 / FS-534/FS-534SD / FS-536/FS-536SD / FS-537/FS-537SD)
(b) When JS-506 is installed
4. Turn OFF the main power switch, disconnect and then connect the power cord. Wait for 10 sec . or more after connect the power cord, and turn ON the main power switch.
5. Rewrite the firmware.
6. Replace JSCB.

### 3.23.4 CC156 (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | CC156: DF ROM error (bizhub C368/C308/C258 When DF-704 is installed, bizhub C658/C558/C458) |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | Upgrade of the firmware has not been successful. |
| Trouble isolation | - |
| Relevant electrical parts | DF control board (DFCB) |

## (2) Procedure

1. Turn OFF the main power switch, disconnect and then connect the power cord. Wait for 10 sec. or more after connect the power cord, and turn ON the main power switch.
2. Rewrite the firmware.
3. Replace DFCB. (DF-629 / DF-704 / Dual scan document feeder)

### 3.23.5 CC159, CC15A (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | • CC159: ROM contents error upon startup (DSC1) <br> • CC15A: ROM contents error upon startup (DSC2) |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | A fault is detected in a sequence of ROM contents check of the DSC board during starting. |
| Trouble isolation | - |
| Relevant electrical parts | - DSC board/1 (DSCB/1; SC-508) |

## (2) Procedure

1. Check DSCB/1 or DSCB/2 connector for proper connection and correct as necessary.
2. Turn OFF the main power switch, disconnect and then connect the power cord. Wait for 10 sec. or more after connect the power cord, and turn ON the main power switch.
3. Rewrite the firmware.
4. Replace DSCB/1 or DSCB/2.

### 3.23.6 CC15B (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | CC15B: Flash ROM error (saddle) (When FS-534SD, FS-536SD, or FS-537SD is installed) |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | Data of flash ROM of the saddle is determined to be faulty when the main power switch is turned ON. |
| Trouble isolation | - |
| Relevant electrical parts | • FS-534SD: SD drive board (SDDB) |

## (2) Procedure

1. Turn OFF the main power switch, disconnect and then connect the power cord. Wait for 10 sec. or more after connect the power cord, and turn ON the main power switch.
2. Rewrite the firmware.
3. Replace SDDB. (FS-534SD only)
4. Replace SDCB. (FS-536SD / FS-537SD) (FS-536SD, FS-537SD only)

### 3.23.7 CC15C (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | CC15C: Engine Flash ROM writing error |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | Data of flash ROM of the engine is determined to be faulty. |
| Trouble isolation | - |
| Relevant electrical parts | MFP board (MFPB) |

## (2) Procedure

1. Turn OFF the main power switch, disconnect and then connect the power cord. Wait for 10 sec. or more after connect the power cord, and turn ON the main power switch.
2. Rewrite the firmware.
3. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

### 3.23.8 CC163 (bizhub C658/C558/C458/C368/C308/C258)

## (1) Contents

| Trouble type | CC163: ROM contents error (PRT) |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | The wrong model of firmware is detected in the engine during the initial connection to the engine is being <br> checked. |
| Trouble isolation | - |
| Relevant electrical parts | • EEPROM $/ 1$ <br>  <br>  <br>  <br>  • EEPROM/2 |

## (2) Procedure

1. Rewrite the firmware.
2. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

NOTE

- When taking the above steps, check whether MFPB is defective or not without replacing the EEPROM.

1. Turn OFF the main power switch and replace the current MFPB with a new one.
2. Update the firmware.
3. After completing the firmware update, turn OFF and ON the main power switch and check to see that warm-up is started.
4. When the trouble cannot be solved, reinstall the removed MFPB to the original board.
5. If the above actions do not solve the problem, contact KM.

### 3.23.9 CC164 (bizhub C658/C558/C458/C368/C308/C258)

## (1) Contents

| Trouble type | CC164: ROM contents error (MSC) |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | • The wrong model of firmware is detected in the MFP board when the main power switch is turned ON. <br> • The machine type information (Machine, Type) registered to the machine differs from the actual machine <br> type. |
| Trouble isolation | $-\quad$. |
| Relevant electrical parts | • MFP board (MFPB) <br> • eMMC board (eMMC) |

## (2) Procedure

1. Check the ROM version.
2. Check the machine type information registered and reenter as necessary.

For details the machine information, see "Entering the machine type information (bizhub C368/C308/C258)" or "Entering the machine type information (bizhub C658/C558/C458)".
3. Rewrite the firmware.
4. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
5. Replace eMMC
6. If the above actions do not solve the problem, contact KM.
3.23.10 CC170, CC171, CC172, CC173, CC174, CC180, CC181, CC182, CC183, CC184, CC185, CC186 (bizhub C658/ C558/C458/C368/C308/C258)

## (1) Contents

| Trouble type | - CC170: Dynamic link error during starting (APO) |
| :--- | :--- |
|  | - CC171: Dynamic link error during starting (AP1) |
|  | - CC172: Dynamic link error during starting (AP2) |
| - CC173: Dynamic link error during starting (AP3) |  |
| - CC174: Dynamic link error during starting (AP4) |  |
|  | - CC180: Dynamic link error during starting (LDR) <br> - CC181: Dynamic link error during starting (IBR) <br> - CC182: Dynamic link error during starting (IID) <br> - CC183: Dynamic link error during starting (IPF) |
|  | - CC184: Dynamic link error during starting (IMY) <br> - CC185: Dynamic link error during starting (SPF) <br> - CC186: Dynamic link error during starting (OAP) |
| Rank | C |
| Trouble detection condition | A dynamic link error occurs in the program on the MFP board due to an insufficient memory space available, a <br>  <br> ROM fault, or other reason when the main power switch is turned ON. |
| Trouble isolation | - |
| Relevant electrical parts | MFP board (MFPB) |

## (2) Procedure

1. If the malfunction code "C-C172" has occurred, access [Service Mode] -> [System 2] -> [Image Controller Setting] and check to see if "Others" is set for image controller.
If any of these is set, according to the kind of controller, select "Controller 0" or "Controller 1."
2. If the malfunction code "C-C180" has occurred, check to install the appropriate loadable device driver for an authentication unit which is installed to the MFP.
When the appropriate loadable device driver is not installed, reinstall the appropriate loadable device driver.
3. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
4. If the above actions do not solve the problem, contact KM.

### 3.23.11 CC190 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | CC190: Outline font load error |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | An error occurred while loading the outline font. |
| Trouble isolation | - |
| Relevant electrical parts | - MFP board (MFPB) <br>  <br> - Hard disk (A) (HDD (A)) |

## (2) Procedure

1. Check the connector between hard disk (A)-MFPB CN20, CN26 for proper connection and correct as necessary.
2. Check the connector between hard disk (B)-MFPB CN7, CN27 for proper connection and correct as necessary.
3. Format the hard disk.
4. Replace the hard disk. (HDD (A) / HDD (B))
5. Replace MFPB.

### 3.23.12 CC190 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | CC190: Outline font load error |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | An error occurred while loading the outline font. |
| Trouble isolation | - |
| Relevant electrical parts | - MFP board (MFPB) <br>  <br>  <br>  <br>  <br>  <br> •Hard disk (A) (HDD (A)) |

## (2) Procedure

1. Check the connector between hard disk(A)-MFPB CN8, CN10 for proper connection and correct as necessary.
2. Check the connector between hard disk(B)-MFPB CN7, CN11 for proper connection and correct as necessary.
3. Format the hard disk.
4. Replace the hard disk. (HDD (A) / HDD (B))
5. Replace MFPB.

### 3.23.13 CC191 (bizhub C658/C558/C458/C368/C308/C258)

## (1) Contents

| Trouble type | CC191: Setting parameter load error (LDR) |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | Upon startup, the processing of the loadable device driver setting data file failed. <br>  <br>  <br> • RAM disk file creation failed. <br> Reading from the flash ROM failed. |
| An error occurred in API of the authentication module. |  |
| Trouble isolation | - |
| Relevant electrical parts | MFP board (MFPB) |

## (2) Procedure

1. Turn OFF the main power switch, wait for 10 sec., then turn the switch ON.
2. Reinstall the loadable device driver.
3. Rewrite the firmware.
4. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
3.23.14 CC211 (bizhub C658/C558/C458/C368/C308/C258)
(1) Contents

| Trouble type | CC211: Authentication device general error |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | When using the authentication device, authentication data is not to meet the specifications. |
| Trouble isolation | - |
| Relevant electrical parts | - MFP board (MFPB) |

## (2) Procedure

1. Check the USB cable for proper connection. Reconnect the USB cable as necessary.
2. Turn OFF the main power switch, wait for 10 sec . or more, and turn ON the main power switch.

### 3.23.15 CC212 (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | CC212: User validation error |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | • An error occurred while validating the user authentication information. <br>  <br> • The loadable device driver is not successfully installed. |
| Trouble isolation | - |
| Relevant electrical parts | • MFP board (MFPB) |

## (2) Procedure

1. When this trouble code is generated after installing the loadable device driver, check to see if there is any file other than loadable device driver in USB memory used. If there is any file, reinstall the loadable device driver.
2. Check the USB cable for proper connection. Reconnect the USB cable as necessary.
3. Turn OFF the main power switch, wait for 10 sec. or more, and turn ON the main power switch.
4. Re-register the user authentication information.
5. Replace authentication device.

### 3.23.16 CC213 (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | CC213: User registration error/Card information setting error |
| :---: | :---: |
| Rank | C |
| Trouble detection condition | - IC card advanced settings data is not correct when starting-up the authentication device. <br> - Authentication information data is not correct when starting-up the authentication device. <br> - IC card advanced settings data is not correct when setting the IC card advanced settings. <br> - Authentication information data is not correct when setting the IC card advanced settings. <br> - IC card advanced settings data is not correct when registering the authentication information. <br> - Authentication information data is not correct when registering the authentication information. <br> - IC card advanced settings data is not correct when editing the authentication information. <br> - Authentication information data is not correct when editing the authentication information. |
| Trouble isolation | - |
| Relevant electrical parts | - MFP board (MFPB) <br> - Authentication device |

## (2) Procedure

1. Check the USB cable for proper connection. Reconnect the USB cable as necessary.
2. Turn OFF the main power switch, wait for 10 sec . or more, and turn ON the main power switch.
3. Reset the authentication settings. (card type, IC card advanced settings, and etc.)
4. Re-register the user authentication information.

### 3.23.17 CC214 (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | CC214: User information deletion error |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | The deletion of the user information is uncompleted. |
| Trouble isolation | - |
| Relevant electrical parts | • MFP board (MFPB) |

## (2) Procedure

1. Check the USB cable for proper connection. Reconnect the USB cable as necessary
2. Turn OFF the main power switch, wait for 10 sec . or more, and turn ON the main power switch.

### 3.23.18 CC216 (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | CC216: Acquisition failure of the number of trials/Initialize error of number of authentication |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | An error occurred during user authentication using optional authentication unit AU-102. |
| Trouble isolation | - |
| Relevant electrical parts | - MFP board (MFPB) |

## (2) Procedure

1. Check the USB cable for proper connection. Reconnect the USB cable as necessary
2. Turn OFF the main power switch, wait for 10 sec . or more, and turn ON the main power switch.
3. Reset the number of authentication trials.

### 3.23.19 CC301 (bizhub C658/C558/C458/C368/C308/C258)

## (1) Contents

| Trouble type | CC301: Authentication customize data error |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | • The master authentication customize data is corrupted upon startup. <br> • Registration of authentication customize data in the main body has failed upon startup. |
| Trouble isolation | - |
| Relevant electrical parts | MFP board (MFPB) |

## (2) Procedure

1. Reinstall the authentication customize data.
2. Rewrite the firmware.
3. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

### 3.23.20 CC302 (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | CC302: Authentication customize data version mismatch error |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | The authentication customize data version is later than the firmware version of the machine. |
| Trouble isolation | - |
| Relevant electrical parts | MFP board (MFPB) |

## (2) Procedure

1. Rewrite the main body firmware with the latest one and reinstall the authentication customize data.
2. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

### 3.23.21 CCC00 (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | CCC00: Public user account track information error |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | At the first time of startup, the nonvolatile status is reset incompletely due to any trouble (such as a shut off of <br> the main power). |
| Trouble isolation | - |
| Relevant electrical parts | eMMC board (eMMC) |

## (2) Procedure

1. Replace eMMC. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

NOTE

- Contact Konica Minolta technical support if the eMMC board needs to be replaced.

### 3.24 CD\#\#\#

### 3.24.1 CD002 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | CD002: JOB RAM save error |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | The error in save of job data to the memory/ hard disk and its read error are detected. |
| Trouble isolation | - |
| Relevant electrical parts | • MFP board (MFPB) <br>  <br>  <br>  <br>  <br> $\quad$- Hard disk (A) (HDD (A)) |

## (2) Procedure

1. Check the connector between hard disk (A)-MFPB CN20, CN26 for proper connection and correct as necessary.
2. Check the connector between hard disk (B)-MFPB CN7, CN27 for proper connection and correct as necessary.
3. Format the hard disk.
4. Replace the hard disk. (HDD (A) / HDD (B))
5. Replace MFPB.

### 3.24.2 CD002 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | CD002: JOB RAM save error |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | The error in save of job data to the memory/ hard disk and its read error are detected. |
| Trouble isolation | - |
| Relevant electrical parts | - MFP board (MFPB) <br>  <br>  <br>  <br> - Hard disk (A) (HDD (A)) <br>  |

## (2) Procedure

1. Check the connector between hard disk(A)-MFPB CN8, CN10 for proper connection and correct as necessary.
2. Check the connector between hard disk(B)-MFPB CN7, CN11 for proper connection and correct as necessary.
3. Format the hard disk.
4. Replace the hard disk. (HDD (A) / HDD (B))
5. Replace MFPB.

### 3.24.3 CD004, CD00F, CD020 (bizhub C368/C308/C258)

## (1) Contents

| Trouble type | - CD004: Hard disk access error (connection failure) <br> - CD00F: Hard disk data transfer error <br> - CD020: Hard disk verify error |
| :---: | :---: |
| Rank | C |
| Trouble detection condition | - CD004: Unable to communicate between the hard disk and MFP board (MFPB). <br> - CD00F: Data transfer from the hard disk is faulty. <br> - CD020: The data abnormality is detected by the hard disk verify check. |
| Trouble isolation | - |
| Relevant electrical parts | - MFP board (MFPB) <br> - Hard disk (A) (HDD (A)) <br> - Hard disk (B) (HDD (B): HD-524) |

## (2) Procedure

1. Check the connector between hard disk (A)-MFPB CN20, CN26 for proper connection and correct as necessary.
2. Check the connector between hard disk (B)-MFPB CN7, CN27 for proper connection and correct as necessary.
3. Reinstall the hard disk.
4. Replace the hard disk. (HDD (A) / HDD (B))
5. Replace MFPB.

### 3.24.4 CD004, CD00F, CD020 (bizhub C658/C558/C458)

## (1) Contents

| Trouble type | - CD004: Hard disk access error (connection failure) <br> - CD00F: Hard disk data transfer error <br> - CD020: Hard disk verify error |
| :---: | :---: |
| Rank | C |
| Trouble detection condition | - CD004: Unable to communicate between the hard disk and MFP board (MFPB). <br> - CD00F: Data transfer from the hard disk is faulty. <br> - CD020: The data abnormality is detected by the hard disk verify check. |
| Trouble isolation | - |
| Relevant electrical parts | - MFP board (MFPB) <br> - Hard disk (A) (HDD (A)) <br> - Hard disk (B) (HDD (B): HD-524) |

## (2) Procedure

1. Check the connector between hard $\operatorname{disk}(\mathrm{A})$-MFPB CN8, CN10 for proper connection and correct as necessary.
2. Check the connector between hard disk(B)-MFPB CN7, CN11 for proper connection and correct as necessary.
3. Reinstall the hard disk.
4. Replace the hard disk. (HDD (A) / HDD (B))
5. Replace MFPB.

### 3.24.5 CD010 (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | CD010: Hard disk unformat |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | Unformatted hard disk is connected. |
| Trouble isolation | - |
| Relevant electrical parts | - MFP board (MFPB) <br>  <br>  <br>  <br>  <br> •Hard disk (A) (HDD (A)) |

## (2) Procedure

1. Format the hard disk.
2. Replace the hard disk. (HDD (A) (bizhub C368/C308/C258) / HDD (A) (bizhub C658/C558/C458) / HDD (B) (bizhub C368/C308/C258) / HDD (B) (bizhub C658/C558/C458))
3. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

### 3.24.6 CD011 (bizhub C658/C558/C458/C368/C308/C258)

## (1) Contents

| Trouble type | CD011: Hard disk out of specifications mounted |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | A hard disk that falls outside the specifications is connected. |
| Trouble isolation | - |
| Relevant electrical parts | - Hard disk (A) (HDD (A)) |

## (2) Procedure

1. Check the hard disk specifications.
2. Replace the hard disk. (HDD (A) (bizhub C368/C308/C258) / HDD (A) (bizhub C658/C558/C458) / HDD (B) (bizhub C368/C308/C258) / HDD (B) (bizhub C658/C558/C458))

### 3.24.7 CD012 (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | CD012: Mount error due to hard disk being unformatted |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | • The hard disk is not logically formatted after the whole data in the hard disk has been deleted by <br> overwriting. |
|  | • The hard disk that has replaced an old one is not logically formatted. |

## (2) Procedure

1. Logically format the hard disk and then upgrade the firmware.
2. Replace the hard disk. (HDD (A) (bizhub C368/C308/C258) / HDD (A) (bizhub C658/C558/C458) / HDD (B) (bizhub C368/C308/C258) / HDD (B) (bizhub C658/C558/C458))

### 3.24.8 CD013, CD014 (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | CD013: HDD mirroring error master <br> CD014: HDD mirroring error slave |
| :--- | :--- |
| Rank | A |
| Trouble detection condition | CD013: A R/W error occurs in the master drive during mirroring. <br> CD014: A R/W error occurs in the slave drive during mirroring. |
| Trouble isolation | - |
| Relevant electrical parts | - Hard disk (A) (HDD (A)) <br> - Hard disk (B) (HDD (B): HD-524) |

## (2) Procedure

1. Turn OFF the main power switch, wait for 10 sec ., then turn the switch ON .
2. Select [Service Mode] -> [State Confirmation] -> [Memory/Storage Status] and identify the specific hard disk that has developed the error. If an error occurs, "Error" appears in the status column.
3. Replace the hard disk that has developed the error with a new one. (HDD (A) (bizhub C368/C308/C258) / HDD (A) (bizhub C658/C558/ C458) / HDD (B) (bizhub C368/C308/C258) / HDD (B) (bizhub C658/C558/C458))
4. Select [Service Mode] -> [State Confirmation] -> [Memory/Storage Adjustment] -> [HDD Mirroring Rebuild] and perform the function.

### 3.24.9 CD015 (bizhub C658/C558/C458/C368/C308/C258)

## (1) Contents

| Trouble type | CD015: HDD mirroring error master slave |
| :--- | :--- |
| Rank | A |
| Trouble detection condition | A R/W error occurs in both drives during mirroring. |
| Trouble isolation | - |
| Relevant electrical parts | • Hard disk (A) (HDD (A)) <br>  |

## (2) Procedure

1. Turn OFF the main power switch, wait for 10 sec ., then turn the switch $O N$.
2. Replace both hard disk (A) and hard disk (B) with new ones. (HDD (A) (bizhub C368/C308/C258) / HDD (A) (bizhub C658/C558/C458) / HDD (B) (bizhub C368/C308/C258) / HDD (B) (bizhub C658/C558/C458))
3. Select [Service Mode] -> [State Confirmation] -> [Memory/Storage Adjustment] -> [Format] and perform physical format.
4. Select [Service Mode] -> [State Confirmation] -> [Memory/Storage Adjustment] -> [Format] and perform logical format.
5. If HDD Data Backup has previously been performed, select [Service Mode] -> [Enhanced Security] -> [HDD Data Backup] -> [Restore] and perform the function.
6. If HDD Data Backup has not been performed previously, install voice data, etc.

### 3.24.10 CD016 (bizhub C658/C558/C458/C368/C308/C258)

## (1) Contents

| Trouble type | CD016: HDD mirroring error master (rebuild) |
| :--- | :--- |
| Rank | A |
| Trouble detection condition | A R/W error occurs in the master drive during HDD Mirroring Rebuild. |
| Trouble isolation | - |
| Relevant electrical parts | • Hard disk (A) (HDD (A)) |

## (2) Procedure

1. Turn OFF the main power switch, wait for 10 sec., then turn the switch ON. If no problems are encountered, HDD Mirroring Rebuild is automatically performed.
2. Select [Service Mode] -> [State Confirmation] -> [Memory/Storage Status] and identify the specific hard disk that has developed the error. If an error occurs, "Error" appears in the status column.
3. Replace the hard disk that has developed the error with a new one. (HDD (A) (bizhub C368/C308/C258) / HDD (A) (bizhub C658/C558/ C458) / HDD (B) (bizhub C368/C308/C258) / HDD (B) (bizhub C658/C558/C458))
4. Select [Service Mode] $->$ [State Confirmation] $->$ [Memory/Storage Adjustment] $->$ [Format] and perform physical format.
5. Select [Service Mode] -> [State Confirmation] -> [Memory/Storage Adjustment] -> [Format] and perform logical format.
6. If HDD Data Backup has previously been performed, select [Service Mode] -> [Enhanced Security] -> [HDD Data Backup] -> [Restore] and perform the function.
7. If HDD Data Backup has not been performed previously, install voice data, etc.

### 3.24.11 CD017 (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | CD017: HDD mirroring error slave (rebuild) |
| :--- | :--- |
| Rank | A |
| Trouble detection condition | A R/W error occurs in the slave drive during HDD Mirroring Rebuild. |
| Trouble isolation | - |
| Relevant electrical parts | - Hard disk (A) (HDD (A)) <br>  |

## (2) Procedure

1. Turn OFF the main power switch, wait for 10 sec ., then turn the switch ON. If no problems are encountered, HDD Mirroring Rebuild is automatically performed.
2. Select [Service Mode] -> [State Confirmation] -> [Memory/Storage Status] and identify the specific hard disk that has developed the error. If an error occurs, "Error" appears in the status column.
3. Replace the hard disk that has developed the error with a new one. (HDD (A) (bizhub C368/C308/C258) / HDD (A) (bizhub C658/C558/ C458) / HDD (B) (bizhub C368/C308/C258) / HDD (B) (bizhub C658/C558/C458))
4. Select [Service Mode] -> [State Confirmation] -> [Memory/Storage Adjustment] -> [HDD Mirroring Rebuild] and perform the function.

### 3.24.12 CD030 (bizhub C658/C558/C458/C368/C308/C258)

## (1) Contents

| Trouble type | CD030: Hard disk management information reading error |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | The machine fails to read administrative information data saved in the hard disk. |
| Trouble isolation | - |
| Relevant electrical parts | - Hard disk (A) (HDD (A)) <br>  |

3.24.13 CD041, CD042, CD043, CD044, CD045, CD046 (bizhub C658/C558/C458/C368/C308/C258)
(1) Contents

| Trouble type | CD041, CD042, CD043, CD044, CD045, CD046: HDD command execution error |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | The error occurred inside the hard disk. |
| Trouble isolation | - |
| Relevant electrical parts | - Hard disk (A) (HDD (A)) <br>  |

## (2) Procedure

1. Check the hard disk specifications.
2. Format the hard disk.
3. Replace the hard disk. (HDD (A) (bizhub C368/C308/C258) / HDD (A) (bizhub C658/C558/C458) / HDD (B) (bizhub C368/C308/C258) / HDD (B) (bizhub C658/C558/C458))

### 3.24.14 CD047, CD048, CD049, CD04A, CD04B (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | CD047, CD048, CD049, CD04A, CD04B: HDD SCSI library error |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | The error occurred inside the hard disk. |
| Trouble isolation | - |
| Relevant electrical parts | • Hard disk (A) (HDD (A)) <br>  |

## (2) Procedure

1. Check the hard disk specifications.
2. Format the hard disk.
3. Replace the hard disk. (HDD (A) (bizhub C368/C308/C258) / HDD (A) (bizhub C658/C558/C458) / HDD (B) (bizhub C368/C308/C258) / HDD (B) (bizhub C658/C558/C458))

### 3.24.15 CD050 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | CD050: Hard disk recovery timeout |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | The hard disk fails to recover from the power save mode within the predetermined period of time. |
| Trouble isolation | - |
| Relevant electrical parts | - MFP board (MFPB) <br>  <br>  <br>  <br>  <br> - Hard disk (A) (HDD (A)) <br> - Hard disk (B) (HDD (B): HD-524) |

## (2) Procedure

1. Check the connector between hard disk (A)-MFPB CN20, CN26 for proper connection and correct as necessary.
2. Check the connector between hard disk (B)-MFPB CN7, CN27 for proper connection and correct as necessary.
3. Reinstall the hard disk.
4. Format the hard disk
5. Replace the hard disk. (HDD (A) / HDD (B))

### 3.24.16 CD050 (bizhub C658/C558/C458)

(1) Contents

| Trouble type | CD050: Hard disk recovery timeout |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | The hard disk fails to recover from the power save mode within the predetermined period of time. |
| Trouble isolation | - |
| Relevant electrical parts | - MFP board (MFPB) <br>  <br>  <br>  <br> - Hard disk (A) (HDD (A)) <br> - Hard disk (B) (HDD (B): HD-524) |

## (2) Procedure

1. Check the connector between hard disk(A)-MFPB CN8, CN10 for proper connection and correct as necessary.
2. Check the connector between hard disk(B)-MFPB CN7, CN11 for proper connection and correct as necessary.
3. Reinstall the hard disk.
4. Format the hard disk.
5. Replace the hard disk. (HDD (A) / HDD (B))

### 3.24.17 CD110 (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | CD110: Wireless LAN destination initialization error |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | When an initialization error occurred on the settings of the wireless LAN in the upgrade kit (UK-212/UK-215). |
| Trouble isolation | - |
| Relevant electrical parts | - |

## (2) Procedure

1. Check the UK-212 or UK-215 connector for proper connection and correct as necessary.
2. Rewrite the firmware.
3. bizhub C368/C308/C258: Reinstall UK-212 or UK-215.
bizhub C658/C558/C458: Reinstall UK-212 or UK-215.

### 3.24.18 CD201, CD202, CD203 (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | - CD201: File memory mounting error <br> - CD202: Memory capacity discrepancy <br> - CD203: Memory capacity discrepancy 2 |
| :---: | :---: |
| Rank | C |
| Trouble detection condition | CD201: <br> - The file memory is not mounted. <br> - The file has any abnormality. |
|  | CD202: <br> - File memory capacity on the MFP board (MFPB) is not enough. <br> - File memory capacity necessary for duplex printing is not enough. |

|  | CD203: File memory capacity on the MFP board (MFPB) is not enough. |
| :--- | :--- |
| Trouble isolation | - |
| Relevant electrical parts | - MFP board (MFPB) <br>  |

## (2) Procedure

1. Check to see if MEMB on MFPB is installed correctly. (bizhub C368/C308/C258 only)
2. Replace MEMB on MFPB. (bizhub C368/C308/C258 only)
3. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

### 3.24.19 CD211, CD212 (bizhub C658/C558/C458/C368/C308/C258)

## (1) Contents

| Trouble type | $\bullet$ CD211: PCI-SDRAM DMA operation failure <br> $\bullet$ <br> CD212: Compression/extraction timeout detection |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | •CD211: Hardware related to the transfer of memory image of the MFP board (MFPB) fails to respond. |
| Trouble isolation | - |
| Relevant electrical parts | MFP board (MFPB) |

## (2) Procedure

1. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

### 3.24.20 CD241, CD242 (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | CD241: Encryption ASIC setting error <br> CD242: Encryption ASIC mounting error |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | CD241: Initialization error of the encrypted ASIC is detected during the machine is starting. <br> CD242: The faulty of the installation of encrypted ASIC is detected during the machine is starting. |
| Trouble isolation | - |
| Relevant electrical parts | MFP board (MFPB) |

## (2) Procedure

1. Check the MFP board connector for proper connection and correct as necessary.
2. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

### 3.24.21 CD252 (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | CD252: No relay board for IC-416 mounting at IC-416 mount setting |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | EFI relay circuit boards (VI-508 or VI-510) are not mounted when the IC-416 is set to mount setting at Service <br> Mode. |
| Trouble isolation | - |
| Relevant electrical parts | - MFP board (MFPB) <br>  |

## (2) Procedure

1. If the IC-416 is not mounted, access [Service Mode] -> [System 2] -> [Image Controller Setting] and check to see if "Controller 0" is set for image controller.
2. Check the EFI relay board (VI-508 or VI-510) connector for proper connection and correct as necessary
3. Replace EFI relay board (VI-508 or VI-510).
4. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

### 3.24.22 CD261 (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | CD261: USB host board failure |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | • When a failure is detected in USB host board included in the local interface kit. <br> • Non-standard USB device is connected. |
| Trouble isolation | - |
| Relevant electrical parts | • MFP board (MFPB) <br> • USB host board (EK-608) <br> • USB host board (EK-609) |

## (2) Procedure

1. Check the operation with another USB device.
2. Check the USB host board connector for proper connection and correct as necessary.
3. Replace the USB host board.
4. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

### 3.24.23 CD262 (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | CD262: Extension network adapter installation error |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | - When the 2nd network card settings is set to "Set" but the upgrade kit (UK-212/UK-215) is not installed. <br>  <br> • Upgrade Kit (UK-212/UK-215) is faulty. |
| Trouble isolation | - |
| Relevant electrical parts | - |

## (2) Procedure

1. Check the settings of [Service Mode] -> [Network Settings] -> [2nd Network Setting] -> [2nd network card settings].
2. Check the UK-212 or UK-215 connector for proper connection and correct as necessary.
3. Rewrite the firmware.
4. bizhub C368/C308/C258: Reinstall UK-212 or UK-215.
bizhub C658/C558/C458: Reinstall UK-212 or UK-215.

### 3.24.24 CD271 (bizhub C368/C308/C258)

(1) Contents

| Trouble type | CD271: i-Option activated and additional memory not installed |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | While the i-Option is activated, the additional memory included in UK-211 is not installed. |
| Trouble isolation | - |
| Relevant electrical parts | • MFP board (MFPB) <br>  |

(2) Procedure

1. Check MEMB for proper connection and correct as necessary.
2. Replace MEMB
3. Replace MFPB.

### 3.24.25 CD271 (bizhub C658/C558/C458)

## (1) Contents

| Trouble type | CD271: The memory cannot be recognized with the i-Option activated |

| Rank | C |
| Trouble detection condition | While the i-Option is activated, the memory on an MFPB cannot be recognized. |
| Trouble isolation | - |
| Relevant electrical parts | MFP board (MFPB) |

(2) Procedure

1. Check MFPB for proper connection and correct as necessary.
2. Replace MFPB.

### 3.24.26 CD272 (bizhub C368/C308/C258)

## (1) Contents

| Trouble type | CD272: i-Option activated and additional memory and HDD not installed |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | While the i-Option is activated, the additional memory included in UK-211 and the HDD are not installed. |
| Trouble isolation | - |
| Relevant electrical parts | - MFP board (MFPB) <br>  <br>  <br> - Mard disk (A) (HDD (A)) |

## (2) Procedure

1. Check MEMB for proper connection and correct as necessary.
2. Access [Service Mode] -> [System 2] -> [HDD] and check to see if "Installed" is selected.
3. Replace MEMB.
4. Replace the hard disk (A).
5. Replace MFPB.

### 3.24.27 CD272 (bizhub C658/C558/C458)

## (1) Contents

| Trouble type | CD272: i-Option activated and HDD not installed |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | While the i-Option is activated, the hard disk is not installed. |
| Trouble isolation | - |
| Relevant electrical parts | • MFP board (MFPB) <br>  |

## (2) Procedure

1. Access [Service Mode] -> [System 2] -> [HDD] and check to see if "Installed" is selected.
2. Replace the hard disk (A).
3. Replace MFPB.

### 3.24.28 CD2D1

(1) Contents

| Trouble type | CD2D1: VLAN setting configuration error |
| :--- | :--- |
| Rank | B |
| Trouble detection condition | At start up of the MFP, the reception condition of VLAN setting activation is not satisfied. |
| Trouble isolation | - |
| Relevant electrical parts | • Hard disk (A) (HDD (A)) <br> eMMC board (eMMCB) |

## (2) Procedure

1. Check if all VLAN setting reception conditions are satisfied.

- A 4GB memory has been installed.
- An HDD has been installed
- If the IC card reader is connected, the LDD of AU-201S has been installed.
- The software SW12 (bit1) has been set to "PKI unsupported" ( $0 \times 00$ ). (PKI mode setting unavailable)
- Service Mode -> [Billing Setting] -> [Management Function Choice] is set to "Not installed".
- Utility -> [Administrator Settings] -> [Network Settings] -> [TCP/IP Settings] is set to "ON".
- Utility -> [Administrator Settings] -> [Network Settings] -> [Network I/F Configuration] is set to "Wireless Only".

### 3.24.29 CD3\#\# (bizhub C658/C558/C458/C368/C308/C258)

## (1) Contents

| Trouble type | CD3\#\#: Nonvolatile data error |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | CD3\#\#: Abnormality is detected by the abnormal check of each nonvolatile data. |
| Trouble isolation | - |

(2) Action

1. Touch [Recover Data] displayed at the lower right portion on the trouble screen.
2. A screen confirming whether to recover data appears

3. Select [Yes].
4. The screen will be shifted to the data restoration screen to perform data restoration.

## NOTE

- When the restoration is performed in a short time, data restoration screen may not be displayed.

5. Check the message which indicates that the data restoration was successfully conducted. Turn OFF the main power switch and turn it

ON again more than 10 seconds after
NOTE

- In case it failed to restore data, return to the trouble code screen.

## NOTE

- Nonvolatile data backup will be automatically performed every hour. Backup can also be performed manually with the following setting. [Service Mode] -> [Enhanced Security] -> [Memory Data Backup]

### 3.24.30 CD313 (bizhub C658/C558/C458/C368/C308/C258)

## (1) Contents

| Trouble type | CD313: TPM key data error |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | A fault occurs in the TPM key data. |
| Trouble isolation | - |
| Relevant electrical parts | - |

## (2) Procedure

1. Touch [Recover Data] displayed at the lower right portion on the trouble screen.
2. A screen confirming whether to recover data appears.

3. Select [Yes].
4. The screen will be shifted to the data restoration screen to perform data restoration.

NOTE

- When the restoration is performed in a short time, data restoration screen may not be displayed.

5. Check the message which indicates that the data restoration was successfully conducted. Turn OFF the main power switch and turn it ON again more than 10 seconds after.
NOTE

- In case it failed to restore data, return to the trouble code screen.

6. Replace the current MFPB with a new one. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

NOTE

- Nonvolatile data backup will be automatically performed every hour. Backup can also be performed manually with the following setting. [Service Mode] -> [Enhanced Security] -> [Memory Data Backup]

### 3.24.31 CD38E (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | CD38E: Nonvolatile data save error (SPI-Flash) |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | The "ISW download flag" saved in the SPI-Flash has an illegal value. |
| Trouble isolation | - |
| Relevant electrical parts | MFP board (MFPB) |

## (2) Procedure

1. Rewrite the firmware.
2. Turn OFF the main power switch, disconnect and then connect the power cord. Wait for 10 sec . or more after connect the power cord, and turn ON the main power switch.

### 3.24.32 CD390 (bizhub C658/C558/C458/C368/C308/C258)

## (1) Contents

| Trouble type | CD390: Nonvolatile data checksum error |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | C-D390 code is normally shown when the MFP board is replaced with a new one. |
| Trouble isolation | - |
| Relevant electrical parts | - |

(2) Procedure

1. Wait until "Recover Data" appears. (MFP will reboot maximum 2 times by itself, it may take 5 minutes.) Touch the "Recover Data" button and follow the instructions that appear on the control panel to restore (backup) data.

### 3.24.33 CD391 (bizhub C658/C558/C458/C368/C308/C258)

## (1) Contents

| Trouble type | CD391: Nonvolatile data save error (eMMC) |
| :--- | :--- |
| Rank | - |
| Trouble detection condition | - |
| Trouble isolation | - |
| Relevant electrical parts | - |

## (2) Procedure

## NOTE

- Contact the responsible people of KM before taking some countermeasures.

### 3.24.34 CD392 (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | CD392: Nonvolatile data save error (EEPROM) |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | The EEPROM is replaced with a new one. |
| Trouble isolation | - |
| Relevant electrical parts | • EEPROM $/ 1$ |

## (2) Procedure

1. Replace the following components with new ones.

When the transfer belt unit and the fusing unit have been replaced with new ones, perform [New Release] in the service mode. When the transfer roller has been replaced with a new one, perform [Counter clear].

- Developing unit/Y,M,C,K
- Drum unit/Y,M,C,K
- Toner cartridge/Y,M,C,K
- Transfer belt unit
- Fusing unit
- Transfer roller
- Feed roller, pick-up roller, separation roller (including options)

2. Turn OFF the main power switch, disconnect and then connect the power cord. Wait for 10 sec . or more after connect the power cord, and turn ON the main power switch.
3. Set the various setting values in the service mode again.

### 3.24.35 CD3A0 (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | CD3A0: Counter error |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | The total counter values provided by the MFP board and the eMMC board are different. |
| Trouble isolation | - |
| Relevant electrical parts | • MFP board (MFPB) <br> eMMC board (eMMC) |

## (2) Procedure

1. If this error occurs temporarily due to the use of the board removed from another machine, reinstall the original board.
2. Replace the current MFPB with a new one.
3. Replace the current eMMC with a new one.

### 3.24.36 CD3C0 (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | CD3C0: New board detection |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | The board is replaced with a new one. |
| Trouble isolation | - |
| Relevant electrical parts | - |

## (2) Procedure

1. Wait until "Recover Data" appears. (MFP will reboot maximum 2 times by itself, it may take 5 minutes.) Touch the "Recover Data" button and follow the instructions that appear on the control panel to restore (backup) data.
3.24.37 CD401, CD402, CD403, CD404, CD405, CD406, CD407, CD411, CD412, CD413 (bizhub C658/C558/C458/C368/ C308/C258)
(1) Contents

| Trouble type | - CD401: NACK command incorrect |
| :--- | :--- |
|  | - CD402: ACK command incorrect |
|  | - CD403: Checksum error |
|  | - CD404: Receiving packet incorrect |
|  | - CD405: Receiving packet analysis error |
|  | - CD407: Retransmission timeout |
|  | - CD411: Touch panel board error |
|  | - CD412: Touch panel type mismatch |
|  | - CD413: Electrostatic touch panel operation mode error |

| Rank | C |
| :--- | :--- |
| Trouble detection condition | When abnormality is found in the communication of controller. |
| Trouble isolation | - |
| Relevant electrical parts | MFP board (MFPB) |

## (2) Procedure

1. Check whether there is a strong electromagnetic noise source near the main body.
2. Check the connectors on MFPB for proper connection and correct as necessary.
3. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

### 3.24.38 CD601, CD602, CD603 (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | CD601, CD602, CD603: Trouble related to security |
| :--- | :--- |
| Rank | - |
| Trouble detection condition | - |
| Trouble isolation | - |

(2) Procedure

1. Turn OFF the main power switch, wait for 10 sec . or more, and turn ON the main power switch. If the above actions do not solve the problem, contact KM.

### 3.24.39 CD701, CD702, CD703 (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | - CD701: Mechanical controller flash ROM writing error <br> - CD702: Mechanical controller flash ROM device error <br> - CD703: FW download communication fault |
| :---: | :---: |
| Rank | C |
| Trouble detection condition | CD701: A mechanical controller flash ROM writing sequence is interrupted in its mid-operation due to, for example, power being shut off. |
|  | CD702: An erase error or other device fault occurs during mechanical controller flash ROM writing. |
|  | CD703: <br> Irregular data is received during FW downloading. <br> - Places are changed in the order of write completion pulses. <br> - A write completion pulse is received for a memory for which binary writing is not permitted. <br> - Final checksum mismatch in FW download <br> - Two-minute timeout (no response from CTL, the number of transfer data items less than the specified) |
| Trouble isolation | - |
| Relevant electrical parts | MFP board (MFPB) |

(2) Procedure

1. Turn OFF the main power switch, disconnect and then connect the power cord. Wait for 10 sec . or more after connect the power cord, and turn ON the main power switch.
2. Rewrite the firmware.
3. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

### 3.24.40 CD704 (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | CD704: Finisher Flash ROM device error (When FS-533, FS-534, FS-534SD, FS-536, FS-536SD, FS-537, <br> FS-537SD, or JS-506 is installed) |
| :--- | :--- |
| Rank | C |
| Trouble detection condition | An erase error or other device fault occurs during the finisher flash ROM writing. |
| Trouble isolation | - |
| Relevant electrical parts | <When FS-533, FS-534, FS-534SD, FS-536, FS-536SD, FS-537, or FS-537SD is installed> <br> • FS control board (FSCB) |
| <When JS-506 is installed> <br> • JS control board (JSCB) |  |

## (2) Procedure

(a) When FS-533, FS-534, FS-534SD, FS-536, FS-536SD, FS-537, or FS-537SD is installed

1. Turn OFF the main power switch, disconnect and then connect the power cord. Wait for 10 sec . or more after connect the power cord, and turn ON the main power switch.
2. Rewrite the firmware.
3. Replace FSCB. (FS-533 / FS-534/FS-534SD / FS-536/FS-536SD / FS-537/FS-537SD)
(b) When JS-506 is installed
4. Turn OFF the main power switch, disconnect and then connect the power cord. Wait for 10 sec . or more after connect the power cord, and turn ON the main power switch.
5. Rewrite the firmware.
6. Replace JSCB.

| Relevant electrical parts | - eMMC board (eMMC) <br> - Hard disk (A) (HDD (A)) <br> - Hard disk (B) (HDD (B): HD-524) |

## (2) Procedure

1. Turn OFF and ON the main power switch.
2. Check the connector from MFPB to hard disk for proper connection and correct as necessary.
3. Check the connector from eMMC to MFPB for proper connection and correct as necessary.
4. Logically format the hard disk.
5. Replace the hard disk. (HDD (A) (bizhub C368/C308/C258) / HDD (A) (bizhub C658/C558/C458) / HDD (B) (bizhub C368/C308/C258) / HDD (B) (bizhub C658/C558/C458))
6. If the above actions do not solve the problem, contact KM.

### 3.25.7 CEEE1, CEEE3 (bizhub C658/C558/C458/C368/C308/C258)

(1) Contents

| Trouble type | • CEEE1: MFP board (MSC) malfunction |
| :--- | :--- |
|  | • CEEE3: MFP board (ENG) malfunction |

| Trouble detection condition | MFP board (MFPB) is faulty. |
| :--- | :--- |
| Trouble isolation | - |
| Relevant electrical parts | MFP board (MFPB) |

## (2) Procedure

1. Check the connectors on MFPB for proper connection and correct as necessary.
2. Replace MFPB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

### 3.25.8 CEEE2 (bizhub C658/C558/C458/C368/C308/C258)

## (1) Contents

| Trouble type | CEEE2: Scanner section malfunction |
| :--- | :--- |
| Rank | A |
| Trouble detection condition | A scanner part is faulty. |
| Trouble isolation | - |
| Relevant electrical parts | • LED exposure unit <br> • CCD board (CCDB) <br> • Scanner drive board (SCDB) |

## (2) Procedure

1. Correct the connector connection between CCDB and SCDB if faulty.
2. Replace SCDB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
3. Replace CCDB. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

## 4. Troubleshooting using Self-diag. (Full)

### 4.1 Overview of Self-diag. (Full) function

- If a trouble code occurs or the machine cannot operate normally due to defects of the control system hardware parts, by executing the "Self-diag. (Full)", the defective areas on the control system hardware parts can be identified.
- The reason for troubles is broadly divided into the control system hardware trouble and the firmware trouble, and it is difficult to identify where the trouble occurs with the trouble code.
In the "Self-diag. (Full)", two functions are provided, the one diagnoses if troubles occur on the control system hardware, and the other one detects defective parts and displays the "error code" corresponding to the defective parts on the control panel.

## NOTE

- Before replacing the control system hardware parts like the MFP board, make sure to execute the "Self-diag. (Full)".

Self-diag. (Full) flow for a trouble code

### 4.2 Self-diag. (Full) Procedure

1. When a trouble code is displayed, turn OFF the main power switch after the MFP is stopped.
2. Execute the Self-diag. (Full). For details of the method for executing the Self-diag. (Full), refer to I.5.19.12 (4) Procedure (from main power switch ON).
3. After completing the Self-diag. (Full), the diagnosis result will be displayed for each item. (OK/NG)
4. If $[\mathrm{OK}]$ is displayed for all items, turn OFF the main power switch.
5. If [NG] is included in the diagnosis result, after completing the diagnosis for all items, the [Error Code] key is displayed.
6. Touch the [Error Code] key to display the [Error Code].
7. Check the displayed [Error Code], then turn OFF the main power switch, and disconnect power cord from the outlet.
8. Refer to the Service Manual [Error Code List], and perform the troubleshooting against each error code.

NOTE

- Perform the troubleshooting in the sequence from step 1 of "Corrective action procedure" against each item while checking that if each trouble has been resolved. Do not perform the troubleshooting against all troubles at once.
- If no error code is displayed, perform the troubleshooting against each trouble code in "Trouble Code" displayed in step 1.

9. Even if no [NG] is displayed (no trouble is reproduced) after executing the troubleshooting against each error code or the Self-diag. (Full), execute the "Self-diag. (Full)" again, and make sure that all troubles on each device have been resolved.

### 4.2.1 Auto Execution of Self-diag. (Full)

- Set the [Switch NO.163] to [00000010] at [Bit assignment] and [02] at [HEX assignment] in [Service Mode] -> [System 2] -> [Software Switch Setting], so that the "Self-diag. (Full)" can be executed automatically when an "trouble code" occurred. Refer to [Service Mode] -> [System 2] -> [State Confirmation] -> [Self-diag. (Full)]

### 4.2.2 Error code resetting procedures

1. Stop the machine with the Error Code screen being displayed.
2. Turn OFF the main power switch. After waiting 10 seconds, turn ON the main power switch again.
3. Reboot the machine.

## NOTE

- If the error has not been resolved, the trouble code will reappear after rebooting the machine.

### 4.3 Error Code List

| Error code | Target device | Diagnosis item | Reason of error | Relevant parts |
| :---: | :---: | :---: | :---: | :---: |
| E1-1 | Prog. device | R/W Check | Engagement/mounting failure | eMMC board (eMMC) MFP board (MFPB) |
| E1-2 |  | MFP FW checksum | eMMC error (data failure) | MFP Firmware eMMC board (eMMC) |
| E1-3 |  | Partition check | eMMC error (data failure) | eMMC board (eMMC) |
| E2-1 | SPI | R/W Check | Mounting failure | MFP board (MFPB) |
| E3-1 | HDD | SATA ID verification | MFP board SPI for SATA (data failure) | MFP board (MFPB) |
| E3-2 |  | I/F Test | HDD error | Connection cable <br> Hard disk (HDD) <br> MFP board (MFPB) |
| E3-3 |  | Memory Check R/W Check S.M.A.R.T diag. | HDD error | Hard disk (HDD) |
| E3-4 |  | Partition check | HDD error | Hard disk (HDD) |
| E4-1 | System/image memory | WORK0 <br> FILE0 <br> FILE1 | Engagement failure Mounting failure DRAM failure | MFP board (MFPB) |
| E4-2 |  | WORK1 | Engagement failure Mounting failure DRAM failure | DIMM(DIMM) MFP board (MFPB) |
| E4-3 |  | $\begin{array}{\|l\|l\|} \hline \text { FILE2 } \\ \text { FILE3 } \end{array}$ | Engagement failure Mounting failure DRAM failure | DS image processing board (DSIPB) <br> Fiery IF board MFP board (MFPB) |
| E4-4 |  | $\begin{array}{\|l\|l\|} \hline \text { FILE4 } \\ \text { FILE5 } \end{array}$ | Engagement failure Mounting failure DRAM failure | DS image processing board (DSIPB) <br> MFP board (MFPB) |
| E5-1 | Various USB devices | USB3.0Host \#0 USB3.0Host \#1 USB2.0Host | Connection failure Parts defect | MFP board (MFPB) |
| E5-2 |  | HUB chip (MFP board on-board) | Connection failure Parts defect | MFP board (MFPB) |
| E5-3 |  | RAID controller | Connection failure Parts defect | MFP board (MFPB) |
| E5-4 |  | HUB chip (USB board on-board) | Connection failure Parts defect | USB board (USBB) MFP board (MFPB) |
| E5-6 |  | DAC-IC | Connection failure Parts defect | USB board (USBB) |
| E5-7 |  | HUB chip (FAX expansion board on-board) | Connection failure Parts defect | Connection cable FAX expansion board |
| E5-8 |  | FAX board (line 1) | Connection failure Parts defect | Connection cable FAX board/1 (FAXB/1) FAX expansion board |
| E5-9 |  | FAX board (line 2) | Connection failure Parts defect | Connection cable FAX board/2 (FAXB/2) FAX expansion board |
| E5-10 |  | FAX board (line 3) | Connection failure Parts defect | Connection cable FAX board/3 (FAXB/3) FAX expansion board |
| E5-11 |  | FAX board (line 4) | Connection failure Parts defect | Connection cable FAX board/4 (FAXB/4) FAX expansion board |
| E5-12 |  | Upgrade kit (UK-212/UK-215) | Connection failure Parts defect | Connection cable <br> Wireless LAN board (PWB-WLAN) <br> Wireless LAN module (WLAN) <br> MFP board (MFPB) |
| E5-13 |  | Authentication unit | Connection failure Parts defect | Authentication unit MFP board (MFPB) |
| E6-1 | CCD board | I/P Image Bus Check | Image bus failure | Connection cable CCD board (CCDB) MFP board (MFPB) |
| E6-2 |  | Line RAM Comparison | CCD sensor failure | Connection cable CCD board (CCDB) MFP board (MFPB) |

| Error code | Target device | Diagnosis item | Reason of error | Relevant parts |
| :---: | :--- | :--- | :--- | :--- |
| E7-1 | CIS Module | I/P Image Bus Check | Image bus failure | CIS cable <br> CIS module (CIS) <br> DS image processing board <br> (DSIPB) |
| E7-2 |  |  |  | CIS module (CIS) |

Troubleshooting against multiple error codes

| Error code |  |
| :--- | :--- |
| E3-2, E5-3 | Execute E3-2 |
| E7-1, E9-1, E11-1, E14-1 | Execute E14-1 |
| E7-1, E9-1, E14-2 | Execute E14-2 |
| E11-1, E14-3 | Execute E14-3 |

### 4.4 E1-1

## Description

| Error code | E1-1 |
| :---: | :--- |
| Target device | Prog. device |
| Diagnosis item | R/W Check |
| Reason of error | Engagement failure <br> Mounting failure |
| Relevant parts | eMMC board (eMMC) <br> MFP board (MFPB) |

## Corrective action procedure

1. Turn OFF the main power switch, disconnect power cord from the outlet.
2. Correct the mounting of the eMMC board if faulty.
3. Correct the mounting of the MFP board and the connection of connectors if faulty.
4. Replace the eMMC board.
5. Replace the MFP board.

### 4.5 E1-2

## Description

| Error code | E1-2 |
| :---: | :--- |
| Target device | Prog. device |
| Diagnosis item | MFP FW checksum |
| Reason of error | eMMC error (data failure) |
| Relevant parts | eMMC board (eMMC) |

## Corrective action procedure

1. Turn OFF the main power switch, disconnect power cord from the outlet.
2. Correct the mounting of the eMMC board if faulty.
3. Rewrite the firmware.
4. Perform re-installation of the firmware.

### 4.6 E1-3

## Description

| Error code | E1-3 |
| :---: | :--- |
| Target device | Prog. device |
| Diagnosis item | Partition check |
| Reason of error | eMMC error (data failure) |
| Relevant parts | eMMC board (eMMC) |

## Corrective action procedure

1. Turn OFF the main power switch, disconnect power cord from the outlet.
2. Correct the mounting of the eMMC board if faulty.
3. Correct the mounting of the MFP board or the connection of connectors if faulty.
4. Replace the eMMC board.

### 4.7 E2-1

## Description

| Error code | E2-1 |
| :---: | :--- |
| Target device | SPI |
| Diagnosis item | R/W Check |
| Reason of error | Mounting failure |
| Relevant parts | MFP board (MFPB) |

## Corrective action procedure

1. Turn OFF the main power switch, disconnect power cord from the outlet.
2. Correct the mounting of the MFP board or the connection of connectors if faulty
3. Replace the MFP board

### 4.8 E3-1

## Description

| Error code | E3-1 |
| :---: | :--- |
| Target device | HDD |
| Diagnosis item | SATA ID verification |
| Reason of error | MFP board SPI for SATA (data failure) |
| Relevant parts | MFP board (MFPB) |

## Corrective action procedure

1. Turn OFF the main power switch, disconnect power cord from the outlet.
2. Correct the mounting of the MFP board or the connection of connectors if faulty
3. Replace the MFP board

### 4.9 E3-2, E3-3, E3-4

## Description

| Error code | E3-2, E3-3 |  |
| :---: | :--- | :--- |
| Target device | HDD |  |
| Diagnosis item | E3-2 | I/F Test |
|  | E3-3 | Memory Check <br> R/W Check <br> S.M.A.R.T diag. |
|  | HDD error |  |
|  | Connection cable <br> Hard disk (HDD) <br> MFP board (MFPB) |  |

## Corrective action procedure

1. Turn OFF the main power switch, disconnect power cord from the outlet.
2. Correct the mounting of the hard disk and the connection cable if faulty.
3. Correct the mounting of the MFP board or the connection of connectors if faulty
4. Execute Logically format of the hard disk
5. Replace the connection cable of the hard disk.
6. Replace the hard disk
7. Replace the MFP board

### 4.10 E4-1, E4-2, E4-3, E4-4

## NOTE

- When executing the Self-diag. (Full) after the trouble code (CE301, CE304) is displayed, the self diagnosis may not complete. In that case, finish the Self-diag. (Full) forcibly, and perform the troubleshooting against the trouble code.
- Turning OFF the main power switch will finish the Self-diag. (Full) forcibly.
" "E4-2" will also be displayed if no DIMM is mounted. If an additional DIMM is not used, no error occurs even if "E4-2" is displayed with the self diagnosis function, and no troubleshooting is required.

## Description

| Error code | E4-1, E4-2, E4-3, E4-4 |  |
| :---: | :---: | :---: |
| Target device | System/image memory |  |
| Diagnosis item | E4-1 | WORKO <br> FILEO <br> FILE1 |
|  | E4-2 | WORK1 |
|  | E4-3 | $\begin{array}{\|l\|l\|} \hline \text { FILE2 } \\ \text { FILE3 } \end{array}$ |
|  | E4-4 | FILE4 FILE5 |
| Reason of error | Engagement failure Mounting failure DRAM failure |  |
| Relevant parts | E4-1 | MFP board (MFPB) |
|  | E4-2 | DIMM(DIMM) MFP board (MFPB) |
|  | E4-3 | DS image processing board (DSIPB) <br> Fiery IF board <br> MFP board (MFPB) |
|  | E4-4 | DS image processing board (DSIPB) MFP board (MFPB) |

## Corrective action procedure

1. Turn OFF the main power switch, disconnect power cord from the outlet.
2. Correct the mounting of the DIMM if faulty.
3. Correct the mounting of the DS image processing board (DSIPB) or the connection of connectors if faulty.
4. Correct the mounting of the Fiery IF board or the connection of connectors if faulty.
5. Correct the mounting of the MFP board or the connection of connectors if faulty.
6. Replace the DIMM.
7. Replace the DS image processing board (DSIPB).
8. Replace the Fiery IF board.
9. Replace the MFP board.

### 4.11 E5-1, E5-2, E5-3

## Description

| Error code | E5-1, E5-2, E5-3 |  |
| :---: | :--- | :--- |
| Target device | Various USB devices |  |
| Diagnosis item | E5-1 | USB3.0Host \#0 <br> USB3.0Host \#1 <br> USB2.0Host |
|  | E5-2 | HUB chip (MFP board on-board) |
|  | E5-3 | RAID controller |
| Reason of error | Connection failure <br> Parts defect |  |
| Relevant parts | MFP board (MFPB) |  |

## Corrective action procedure

1. Turn OFF the main power switch, disconnect power cord from the outlet.
2. Correct the mounting of the MFP board or the connection of connectors if faulty.
3. Replace the MFP board.

### 4.12 E5-4

## Description

| Error code | E5-4 |
| :---: | :--- |
| Target device | Various USB devices |
| Diagnosis item | HUB chip (USB board on-board) |
| Reason of error | Connection failure <br> Parts defect |

| Relevant parts | USB board (USBB) <br> MFP board (MFPB) |
| :---: | :--- |

## Corrective action procedure

1. Turn OFF the main power switch, disconnect power cord from the outlet.
2. Correct the mounting of the USB board or the connection of connectors if faulty.
3. Correct the mounting of the MFP board or the connection of connectors if faulty.
4. Replace the USB board.
5. Replace the MFP board.

### 4.13 E5-6

## Description

| Error code | E-5-6 |
| :---: | :--- |
| Target device | Various USB devices |
| Diagnosis item | DAC-IC |
| Reason of error | Connection failure <br> Parts defect |
| Relevant parts | USB board (USBB) |

## Corrective action procedure

1. Turn OFF the main power switch, disconnect power cord from the outlet.
2. Correct the mounting of the USB board or the connection of connectors if faulty
3. Replace the USB board.

### 4.14 E5-7, E5-8, E5-9, E5-10, E5-11

## Description

| Error code | E5-7, E5-8, E5-9, E5-10, E5-11 |  |
| :---: | :---: | :---: |
| Target device | Various USB devices |  |
| Diagnosis item | E5-7 | HUB chip |
|  | E5-8 | FAX board |
|  | E5-9 | FAX board |
|  | E5-10 | FAX board |
|  | E5-11 | FAX board |
| Reason of error | Connection failure Parts defect |  |
| Relevant parts | Connection cable <br> FAX board/1 (FAXB/1) <br> FAX board/2 (FAXB/2) <br> FAX board/3 (FAXB/3) <br> FAX board/4 (FAXB/4) <br> FAX expansion board |  |

## Corrective action procedure

1. Turn OFF the main power switch, disconnect power cord from the outlet.
2. Correct the mounting of the FAX board or the connection of connectors if faulty.
3. Correct the mounting of the FAX expansion board or the connection of connectors if faulty.
4. Correct the mounting of the connection cable if faulty.
5. Replace the connection cable.
6. Replace the FAX board.
7. Replace the FAX expansion board.

### 4.15 E5-12

## Description

| Error code | E5-12 |
| :---: | :--- |
| Target device | Various USB devices |
| Diagnosis item | Upgrade kit (UK-212) <br> Upgrade kit (UK-215) |
| Reason of error | Connection failure <br> Parts defect |
| Relevant parts | Connection cable <br> Wireless LAN board (PWB-WLAN) <br> Wireless LAN module (WLAN) <br> MFP board (MFPB) |

## Corrective action procedure

1. Turn OFF the main power switch, disconnect power cord from the outlet.
2. Correct the mounting of the upgrade kit (UK-212/UK-215) or the connection of connectors if faulty.
3. Correct the mounting of the MFP board or the connection of connectors if faulty.
4. Correct the mounting of the connection cable if faulty.
5. Replace the connection cable.
6. Replace the wireless LAN board.
7. Replace the Wireless LAN module.
8. Replace the MFP board.

### 4.16 E5-13

## Description

| Error code | E5-13 |
| :---: | :--- |
| Target device | Various USB devices |
| Diagnosis item | Authentication unit |
| Reason of error | Connection failure <br> Parts defect |
| Relevant parts | Authentication unit <br> MFP board (MFPB) |

## Corrective action procedure

1. Turn OFF the main power switch, disconnect power cord from the outlet.
2. Correct the mounting and connection of the authentication unit if faulty.
3. Correct the mounting of the MFP board or the connection of connectors if faulty.
4. Replace the authentication unit.
5. Replace the MFP board.

### 4.17 E6-1, E6-2

## Description

NOTE

- When executing the Self-diag. (Full) after the trouble code (C6\#\#\#, C91\#\#) is displayed, the self diagnosis may not complete. In that case, finish the Self-diag. (Full) forcibly, and perform the troubleshooting against the trouble code.
- Turning OFF the main power switch will finish the Self-diag. (Full) forcibly.

| Error code | E6-1, E6-2 |  |
| :---: | :--- | :--- |
| Target device | CCD board |  |
| Diagnosis item | E6-1 | O/P Image Bus Check |
|  | E6-2 | Line RAM Comparison |
| Reason of error | E6-1 | Image bus failure |
|  | E6-2 | CCD sensor failure |
| Relevant parts | Connection cable <br> CCD board (CCDB) <br> MFP board (MFPB) |  |

## Corrective action procedure

1. Turn OFF the main power switch, disconnect power cord from the outlet.
2. Correct the mounting of the CCD board and the connection cable if faulty.
3. Correct the mounting of the MFP board or the connection of connectors if faulty.
4. Replace the connection cable.
5. Replace the CCD unit.
6. Replace the MFP board.

### 4.18 E7-1, E7-2

## Description

NOTE

- When executing the Self-diag. (Full) after the trouble code (C6\#\#\#, C91\#\#) is displayed, the self diagnosis may not complete. In that case, finish the Self-diag. (Full) forcibly, and perform the troubleshooting against the trouble code.
- Turning OFF the main power switch will finish the Self-diag. (Full) forcibly.

| Error code | E7-1, E7-2 |  |
| :---: | :--- | :--- |
| Target device | CCD board |  |
| Diagnosis item | E7-1 | O/P Image Bus Check |
|  | E7-2 | Line RAM Comparison |
| Reason of error | E7-1 | Image bus failure |
|  | E7-2 | CIS sensor failure |
| Relevant parts | CIS cable <br> CIS module (CIS) <br> DS image processing board (DSIPB) |  |

## Corrective action procedure

1. Turn OFF the main power switch, disconnect power cord from the outlet.
2. Correct the mounting of the CIS module and the CIS cable if faulty.
3. Correct the mounting of the DS image processing board or the connection of connectors if faulty.
4. Replace the CIS cable.
5. Replace the CIS module.
6. Replace the DS image processing board.

### 4.19 E8-1

## Description

| Error code | E8-1 |
| :---: | :--- |
| Target device | DF control board |
| Diagnosis item | MINET communication check |
| Reason of error | ADF microcomputer communication failure |
| Relevant parts | Connection cable <br> DF control board (DFCB) <br> MFP board (MFPB) |

## Corrective action procedure

1. Turn OFF the main power switch, disconnect power cord from the outlet.
2. Correct the mounting of the DF control board and the connection of connectors if faulty.
3. Correct the mounting of the MFP board or the connection of connectors if faulty.
4. Correct the mounting of the connection cable if faulty.
5. Replace the connection cable.
6. Replace the DF control board.
7. Replace the MFP board.

### 4.20 E9-1

## Description

| Error code | E9-1 |
| :---: | :--- |
| Target device | DS image processing board (DSIPB) |
| Diagnosis item | Compress/exp check |
|  | Memory path check |
| Reason of error | ASIC image error |
|  | Image memory error |
| Relevant parts | DS image processing board (DSIPB) |

## Corrective action procedure

1. Turn OFF the main power switch, disconnect power cord from the outlet.
2. Correct the mounting of the DS image processing board and the connection of connectors if faulty.
3. Replace the DS image processing board.

### 4.21 E10-1, E10-2

## Description

| Error code | E10-1, E10-2 |  |
| :---: | :--- | :--- |
| Target device | System/image memory |  |
| Diagnosis item | E10-1 | Image Bus Check (Front Side) |
|  | E10-2 | Image Bus Check (Back Side) |
| Reason of error | Engagement failure <br> Mounting failure |  |
| Relevant parts | E10-1 | DSC board1 (DSCB/1) <br> MFP board (MFPB) |
|  | E10-2 | DSC board2 (DSCB/2) <br> MFP board (MFPB) |

## Corrective action procedure

1. Turn OFF the main power switch, disconnect power cord from the outlet.
2. Correct the mounting of the DSC board1 if faulty.
3. Correct the mounting of the DSC board2 if faulty.
4. Correct the mounting of the MFP board or the connection of connectors if faulty.
5. Replace the DSC board1. (E10-1 only)
6. Replace the DSC board2. (E10-2 only)
7. Replace the MFP board.

### 4.22 E11-1

## Description

| Error code | E11-1 |
| :---: | :--- |
| Target device | Fiery IF board |
| Diagnosis item | Compress/exp check |
| Reason of error | Image bus failure |

## Relevant parts $\quad$ DS image processing board (DSIPB) Fiery IF board

## Corrective action procedure

1. Turn OFF the main power switch, disconnect power cord from the outlet.
2. Correct the mounting of the DS image processing board (DSIPB) or the connection of connectors if faulty.
3. Correct the mounting of the Fiery IF board and the connection of connectors if faulty.
4. Replace the DS image processing board (DSIPB).
5. Replace the Fiery IF board.

### 4.23 E13-1

## Description

| Error code | E13-1 |
| :---: | :--- |
| Target device | MFP Board |
| Diagnosis item | Compress/exp check <br> O/P Image Bus Check |
|  | Memory path check |
| Reason of error | ASIC image error |
|  | Image memory error |
| Relevant parts | MFP board (MFPB) |

## Corrective action procedure

1. Turn OFF the main power switch, disconnect power cord from the outlet.
2. Correct the mounting of the MFP board or the connection of connectors if faulty.
3. Replace the MFP board.

### 4.24 E14-1, E14-2, E14-3

## Description

| Error code | E14-1, E14-2, E14-3 |  |
| :---: | :---: | :---: |
| Target device | PCle |  |
| Diagnosis item | PCle device check |  |
| Reason of error | PCle device error |  |
| Relevant parts | E14-1 | MFP board (MFPB) |
|  | E14-2 | DS image processing board (DSIPB) MFP board (MFPB) |
|  | E14-3 | Fiery IF board MFP board (MFPB) |

## Corrective action procedure

1. Turn OFF the main power switch, disconnect power cord from the outlet.
2. Correct the mounting of the DS image processing board or the connection of connectors if faulty
3. Correct the mounting of the Fiery IF board or the connection of connectors if faulty.
4. Correct the mounting of the MFP board or the connection of connectors if faulty.
5. Replace the DS image processing board
6. Replace the Fiery IF board.
7. Replace the MFP board.
8. Troubleshooting when NG is displayed on the Self-diag. (Individual)

### 5.1 Various USB Check

### 5.1.1 Troubleshooting when NG is displayed for Keyboard

1. Turn OFF the main power switch, disconnect power cord from the outlet.
2. Correct the mounting of the keyboard if faulty.
3. Correct the mounting of the USB board if faulty.
4. Replace the keyboard.
5. Replace the USB board

### 5.1.2 Troubleshooting when NG is displayed for USB Memory

1. Turn OFF the main power switch, disconnect power cord from the outlet.
2. Correct the mounting of the USB memory if faulty.
3. Correct the mounting of the USB board if faulty.
4. Replace the USB memory.
5. Replace the USB board.

### 5.2 MFP Board Check

### 5.2.1 Troubleshooting when NG is displayed for Ping Test

1. Turn OFF the main power switch, disconnect power cord from the outlet.
2. Check, and correct the MFP network settings if faulty.
3. Correct the mounting of the LAN cable if faulty.
4. Correct the mounting of the MFP board if faulty.
5. Replace the LAN cable.
6. Replace the MFP board

## 6. ABORT CODE

### 6.1 Troubleshooting of the abort code (bizhub C368/C308/C258)

- The machine displays an abort code (CF\#\#\#) on the control panel as it becomes unable to process tasks properly through its software control.
- When the system program is aborted, check the electrical component, unit, option, and connection relating to the specific type of the abort condition.

### 6.1.1 Contents

| Trouble type | Abort code |
| :---: | :---: |
| Trouble code | CF001 to CFFE0 |
| Rank | C |
| Trouble detection condition | - |
| Trouble isolation | - |
| Relevant electrical parts | - MFP board (MFPB) <br> - Memory board (MEMB: UK-211) <br> - EFI relay board (VI-508) <br> - Dual scan image processing board (DSIPB: DF-704) <br> - Hard disk (A) (HDD (A)) <br> - Hard disk (B) (HDD (B): HD-524) |

### 6.1.2 Procedure

- When an abort code occurs, take a check and action in the following procedure.

| Step | Section | Check Item | $\begin{gathered} \text { Resul } \\ t \end{gathered}$ | Action |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Main power switch | Turn OFF and ON the main power switch, and check if the Abort code appears again. | NO | When not reappearing, continuous use is carried out, and it is checked whether an abort code occurs. |
| 2 | Connector connection | Check the connector for proper connection and correct as necessary. <br> - MFP board (MFPB) <br> - Memory board (MEMB: UK-211, Expansion memory) <br> - EFI relay board (VI-508) <br> - Dual scan image processing board (DSIPB: DF-704) <br> - Hard disk (A) (HDD (A)) <br> - Hard disk (B) (HDD (B): HD-524) | NO | It will correct, if connector connection has abnormalities. |
| 3 | Firmware | Update the firmware to the latest version, and check if the Abort code appears again. | NO | Select [Service Mode] -> [Firmware Version] and make sure that the firmware has been updated to the correct version. |
| 4 | Memory Check | Execute [Service Mode] -> [State Confirmation] -> [Memory/Storage Adjustment] -> [Memory Check] -> [Rough Check], and check that no abnormalities. | NO | When "NG" is displayed, replace the appropriate memory or PWB. <br> - WORKO: Standard memory (MFPB) <br> - WORK1: Memory board (MEMB: UK-211) <br> - FILE0,1: MFP board (MFPB) <br> - FILE2,3: EFI relay board (VI-508) <br> - FILE4,5: Dual scan image processing board (DSIPB: DF-704) |
| 5 | Storage R/W Check | Execute [Service Mode] -> [State Confirmation] -> [Memory/Storage Adjustment] -> [Storage R/W Check], and check that no abnormalities. | NO | When "NG" is displayed, replace the hard disk (HDD). |
| 6 | MFP board | Replace the MFP board (MFPB), and then check the MFPB. | NO | Other electric parts indicated to Component of abort code list are replaced. |

### 6.2 Troubleshooting of the abort code (bizhub C658/C558/C458)

- The machine displays an abort code (CF\#\#\#) on the control panel as it becomes unable to process tasks properly through its software control.
- When the system program is aborted, check the electrical component, unit, option, and connection relating to the specific type of the abort condition.

### 6.2.1 Contents

| Trouble type | Abort code |
| :--- | :--- |
| Trouble code | CF001 to CFFB5 |
| Rank | C |
| Trouble detection condition | - |
| Trouble isolation | - |
| Relevant electrical parts | • MFP board (MFPB) |

- EFI relay board (VI-510)
- Dual scan image processing board (DSIPB)
- Hard disk (A) (HDD (A))
- Hard disk (B) (HDD (B): HD-524)

### 6.2.2 Procedure

- When an abort code occurs, take a check and action in the following procedure.

| Step | Section | Check Item | Resul <br> t | Action |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Main power switch | Turn OFF and ON the main power switch, and check if the Abort code appears again. | NO | When not reappearing, continuous use is carried out, and it is checked whether an abort code occurs. |
| 2 | Connector connection | Check the connector for proper connection and correct as necessary. <br> - MFP board (MFPB) <br> - EFI relay board (VI-510) <br> - Dual scan image processing board (DSIPB) <br> - Hard disk (A) (HDD (A)) <br> - Hard disk (B) (HDD (B): HD-524) | NO | It will correct, if connector connection has abnormalities. |
| 3 | Firmware | Update the firmware to the latest version, and check if the Abort code appears again. | NO | Select [Service Mode] -> [Firmware Version] and make sure that the firmware has been updated to the correct version. |
| 4 | Memory Check | Execute [Service Mode] -> [State Confirmation] -> [Memory/Storage Adjustment] -> [Memory Check] -> [Rough Check], and check that no abnormalities. | NO | When "NG" is displayed, replace the appropriate memory or PWB. <br> - WORKO: Standard memory (MFPB) <br> - WORK1: Expansion memory <br> - FILE0,1: MFP board (MFPB) <br> - FILE2,3: EFI relay board (VI-510) <br> - FILE4,5: Dual scan image processing board (DSIPB) |
| 5 | Storage R/W Check | Execute [Service Mode] -> [State Confirmation] -> [Memory/Storage Adjustment] -> [Storage R/W Check], and check that no abnormalities. | NO | When "NG" is displayed, replace the hard disk (HDD). |
| 6 | MFP board | Replace the MFP board (MFPB), and then check the MFPB. | NO | Other electric parts indicated to Component of abort code list are replaced. |

### 6.3 CFO\#\#

| Error code | Item |  | Component | Rank |
| :---: | :---: | :---: | :---: | :---: |
| CF001 | CT_singleList table abnormal | An exceptional instance occurred due to the unexpected parameter in the system F/W. | MFP board (MFPB) | C |
| CF004 | CT_queue full abnormal |  |  |  |
| CF011 | Array link abnormal |  |  |  |
| CF012 | FAT link abnormal |  |  |  |
| CF013 | File size abnormal |  |  |  |
| CF021 | setDelayMessage Table OverFlow |  |  |  |
| CF023 | MsgQue OverFlow |  |  |  |
| CF033 | setDivTbl() limitation over |  |  |  |
| CF061 | IdeCommand_Set() status Abnormal |  |  |  |
| CF062 | IdeCommand_Set() parameter Abnormal |  |  |  |

### 6.4 CF1\#\#

## 7. ERROR CODE FOR THE INTERNET ISW

### 7.1 Error code list for the Internet ISW

- When a trouble occurred while conducting the Internet ISW and it was not normally connected, the message on the status and the error code will be displayed on the control panel.
Internet ISW

$\quad$| Failed to connect to the Firmware Server. |
| :--- |
| Turn main switch OFF and ON. |
| Please do not turn Sub-Power Off ! |

$\quad$| Code:00003200 |
| :--- |

## NOTE

- When a code other than the error code list is displayed, contact and inform the error code.

### 7.2 0x0\#

| Error code | Description | Countermeasure |
| :---: | :---: | :---: |
| 0x00000001 | Illegal error on the control | - Check if [Service Mode] -> [Machine Update Setting] -> [Internet ISW] -> [Internet ISW Set] is set to "ON". <br> - Check the status of [Service Mode] -> [Machine Update Setting] -> [Internet ISW] -> [Forwarding Access Setting]. <br> - If the above process does not solve the problem, inform the corresponding error code to the KONICA MINOLTA. |
| 0x00000010 | Parameter error | - Check if [Service Mode] -> [Machine Update Setting] -> [Internet ISW] -> [Internet ISW Set] is set to "ON". <br> - If the above process does not solve the problem, inform the corresponding error code to the KONICA MINOLTA. |
| 0x00111000 | Error concerning the network <br> - Connection has been completed. | - Check the User's network environment. | 0x00007\#\#\# | FTP error <br> - Error reply code for the RETR command. | - Check to see if the FTP server operates normally. <br> - Wait for about 30 minutes and try it again. |

### 7.3 0x1\#

| Error code | Description | Countermeasure |
| :---: | :---: | :---: |
| 0x10000100 | - It cannot be accepted because of the job currently being executed. <br> - ISW being executed by other method. | Wait for the current job to be completed and try it again. |
| 0x10000101 | It cannot be accepted because the power key is OFF. | Turn power key ON and try it again. |
| 0x10000102 | The Internet ISW is already being executed. | Wait for the current Internet ISW to be completed. |
| 0x10000103 | It failed to prohibit the job. (It failed to lock the operation.) <br> -> It failed to lock the job because the operation is already locked with PSWC, etc. | - Check if [Service Mode] -> [Machine Update Setting] -> [Internet ISW] -> [Internet ISW Set] is set to "ON". <br> - If the above process does not solve the problem, inform the corresponding error code to the KONICA MINOLTA. |
| 0x10000104 | There is no space for firmware data to be downloaded. |  |
| 0x10000106 | Check sum error |  |
| 0x10000107 | File access error <br> - The file downloaded has an error. <br> - The header of the file which has been read has an error. <br> - The size of the file to be downloaded is too large. <br> - When it is identified to be the different type of firmware. | Check to see if the downloaded firmware is of the correct type. |
| 0x10000108 | The area firmware is stored is destroyed, and another ISW is necessary. | Wait until ISW is automatically executed on MFP side. |

### 7.4 0x2\#

| Error code | Description | Countermeasure |
| :---: | :--- | :--- |
| $0 \times 20000000$ | The temporary error when running the <br> subset <br> - When starting the Internet ISW in a <br> normal program, the rebooting will <br> start and the Internet ISW will be <br> executed with the subset program. <br> During the process by the subset <br> program, it has to be in the "Failed" <br> status unless the Internet ISW is <br> successfully conducted. This code is <br> used temporarily to make it in error <br> status. |  |

## 8. CS Remote Care ERROR CODE

### 8.1 Troubleshooting for CS Remote Care

If communication is not done properly, check the condition by following the procedures shown below.

1. Shift the screen in the order of [Service Mode] -> [CS Remote Care] -> [Detail Setting].

At this time, in the cases of initial transmitting / administrator transmitting / maintenance start transmitting / maintenance finish transmitting, the communication result will be displayed at the top of the screen.

## NOTE

- For the communication result, the following message will be displayed based on its success or failure.

| Display of communication result | Cause | Solution |
| :--- | :--- | :--- |
| Communicating | - | - |
| Communication trouble with the center | Although the machine tries to communicate <br> with the center, there is any trouble and the <br> communication completes unsuccessfully. | See the list of error message and confirm the <br> corresponding point. |
| Complete successfully | - | - |
| Modem trouble | Although the machine tries to communicate <br> with the center, there is any trouble in the <br> modem. | • Check if the power of modem in ON. <br> - Check if there is any problem in <br> connection between the modem and the <br> main body. |
| Busy line | Although the machine tries to communicate <br> with the center, the line to the center is busy. | Communicate with the center again. <br> No responseAlthough the machine tries to communicate <br> with the center, there is no response from the <br> center. |
| Communicate with the center again. <br> Check the communication environment of <br> the center side. |  |  |

### 8.2 CS Remote Care Operation under Enhanced Security Mode

CS Remote Care can be used even when "ON" is selected in [Administrator Settings] -> [Security Settings] -> [Enhanced Security Mode]. However, to keep the enhanced security level, the following restrictions are accompanied.

- Only SSL communication is available.
- Error occurs if the Center tries to send the following commands.
- Firmware update command
- Command of reading and updating account track information
- Machine settings update command
- Command of reading and updating Internet ISW setting information

### 8.3 List of the CS Remote Care error code

### 8.3.1 When connecting by modem

## NOTE

- When a code other than the ones listed below is displayed, contact KM and inform the error code.

| Error code | Contents | Solution |
| :---: | :---: | :---: |
| 0001 | The line is busy <br> - Busy detection | Transmit again manually. |
| 0002 | Failure of the Modem default setting at transmitting <br> - When the transmission completes with modem initial setting failed | - Check if the power of the modem is ON. <br> - Check the connecting condition between the modem and the main body. |
| 0003 | Timeout of CONNECT at transmitting <br> - No response to ATD | - Transmit again manually. <br> - Check if the power of the modem is ON. <br> - Check the connecting condition between the modem and the main body. |
| 0004 | Timeout of response to receiving request <br> - No response to receiving (start) request MSG | - Check if the power of the modem is ON. <br> - Check the connecting condition between the modem and the main body. |
| 0005 | Timeout of CONNECT at receiving <br> - No response to ATA | - Check if the power of the modem is ON. <br> - Check the connecting condition between the modem and the main body. |
| 0006 | Shut down of the data modem line (Host) <br> - Carrier OFF is detected | No solution, because the line is shut down at the host side. |
| 0007 | Forced line disconnection of data modem (main body) <br> - The line is forcibly disconnected from the event | - Check if the power of the modem is ON. <br> - Check the connecting condition between the modem and the main body. |
| 0008 | Timeout of start request telegram delivery <br> - Start request telegram is not delivered after line connection | Transmit again manually. |
| 0009 | Timeout of finish request telegram delivery <br> - Finish request telegram is not delivered (Start of shut down) | Transmit again manually. |
| 000A | Receiving rejection <br> - Receiving is made when the main body is set to reject receiving. | - Check the setting condition of the host side. <br> - Check the setting condition of the main body side. |

| Error code | Contents | Solution |
| :---: | :---: | :---: |
| 000E | Receiving ring buffer full <br> - When receiving ring buffer is full | If the same error is detected several times, turn the modem power OFF and ON. |
| 000F | Transmission ring buffer full <br> - When transmission ring buffer is full | If the same error is detected several times, turn the modem power OFF and ON. |
| 0014 | Incorrect transmission data length <br> - When transmission of a data with the length longer than the transmission ring buffer size is requested | If the same error is detected several times, turn the modem power OFF and ON. |
| 0015 | Status error (upon modem operation check) | Transmit again manually. |
| 0016 | Status error (upon data arrival) | Transmit again manually. |
| 0017 | Status error (upon line disconnection) | Transmit again manually. |
| 0019 | Center ID error <br> - Center ID of the host is not identical with the one of start request telegram. | - Check center ID setting of the main body side. <br> - Check the setting condition of the host side. |
| 001A | Device ID inconsistency <br> - Device ID of the host is not identical with the one of start request telegram. | - Check device ID setting of the main body side. <br> - Check the setting condition of the host side. |
| 001B | Device ID unregistered <br> - Request telegram 2 (Constant data transmitting, emergency call) comes from the main body that has not registered device ID yet. | - Check device ID setting of the main body side. <br> - Check the setting condition of the host side. |
| 001C | Grammar error <br> - The specified format is not used in the received reply telegram. | Check the settings for CSRC application. |
| 001D | Change unavailable (Item where change is prohibited) <br> - Host inquires change of the setting of the item not allowed to be changed. | Check the settings for CSRC application. |
| 001E | Impossible to change (during printing) <br> - Setting cannot be changed because the setting change is made during the machine is printing or starts printing. | Try again when the machine is not printing. |
| 001F | Change unavailable (Item where change is prohibited) <br> - Host attempts to write data to the item of which current value has not been read. | Check the settings for CSRC application. |
| 0020 | Timeout of telegram delivery <br> - At waiting mode of telegram delivery the machine fails to receive the telegram in a given time. | Try communication again. |
| 0021 | Telegram longer than the specified length. <br> - A telegram longer than the specified length is received. | Check the settings for CSRC application. |
| 0022 | Transmission phase response NG | Try communication again. |
| 0023 | Timeout of transmission phase response MSG | Try communication again. |
| 0024 | Incorrect acquisition function of event data | Try communication again. |
| 0025 | Timeout of driver transmission check MSG | Try communication again. |
| 0026 | An internal inconsistence is detected | Try communication again. |
| 0027 | Transmission / receiving collision <br> - Receiving is detecting during transmitting processing | Try communication again. |

### 8.3.2 When connecting by e-mails

NOTE

- When a code other than the ones listed below is displayed, contact KM and inform the error code.
(1) 0\#\#\#

| Error code | Contents | Solution |
| :--- | :--- | :--- |
| 0\#\#\# | Transmission error <br> $\# \# \#:$ SMTP responding code (hexadecimal) <br> For SMTP responding code, see RFC issued by IETF after converting <br> hexadecimal number into decimal one. | Check the user's SMTP server system settings. <br> • Authentication setting <br> • Authentication ID <br> • Authentication password <br> - Address of the destination where the server is <br> connected |

## (2) 1\#\#\#

| Error code | Contents | Solution |
| :--- | :--- | :--- |
| 1030 | Machine ID mismatching <br> • Received an e-mail which tells that machine ID mismatches. | • Check the machine ID setting. <br> • Check the machine ID setting on host side. |
| 1050 | Grammar error <br> • Received mail did not define the CS Remote Care command (2 <br> digits). <br> The Type of Subject and the command of attached file are not <br> consistent. | Ask the host to send another mail. |

| Error code | Contents | Solution |
| :---: | :---: | :---: |
| 1061 | Modifying not allowed <br> - The host sent a command mail that asked modifying data of item where setting change is not allowed. | Ask the host to send another instruction mail for modifying. |
| 1062 | Modifying not available due to the copy job currently performing <br> - When informing the host that it cannot be modified due to the copy job currently performing. | Ask the host to send another instruction mail for modifying. |
| 1080 | Data length problem <br> - LEN value of TEXT data and actual data length are not consistent. | Ask the host to send another instruction mail for modifying. |
| 1081 | Frame No. error <br> - The last frame has not been received. <br> - There are missing frame No. | Check the status of the machine registration on host side, and perform initial transmission as necessary. |
| 1082 | Subject Type problem <br> - Received code did not define the Type of Subject. | Ask the host to send another instruction mail for modifying. |
| 1084 | Date expired <br> - Expiration date for data modification command has passed. | Ask the host to send another instruction mail for modifying. |
| 1091 | Oversized command <br> - Received attached file exceeds the machine's receive buffer size. | Ask the host to send another instruction mail for modifying. |
| 1092 | Received an error mail when center setup is not complete | Check the status of the machine registration on host side. |
| 1099 | Illegal request <br> - Status not predicted in design is detected. | Check the status of the machine registration on host side, and perform initial transmission as necessary. |

(3) 2\#\#\#

| Error code | Contents | Solution |
| :--- | :--- | :--- |
| 2064 | Network is down <br> L LAN cable on main body side is detached. | • Check the connection between main body on <br> the user's side and the network connector. <br> Check the network environment on the user's <br> side. |
| 206 B | Communication from an MFP to the server is disabled due to <br> problems on the server side <br> $\bullet \quad$ LAN cable on the copier side is detached. | • Check the connection between main body on <br> the user's side and the network connector. <br> Check the network environment on the user's <br> side. |
| 203 E | Connection timeout | Check timeout setting. |

## (4) 3\#\#\#

| Error code | Contents | Solution |
| :---: | :---: | :---: |
| 3001 | POP3_AUTHORIZATION_ERR | Check the user's POP3 server system settings. <br> - Authentication setting <br> - Connection ID <br> - Password <br> - Address of the destination where the server is connected |
| 3002 | POP3_TRANSACTION_ERR |  |
| 3003 | POP3_CONNECT_ERR |  |
| 3004 | POP3_TIMEOUT_ERR |  |
| 3005 | POP3_FORMAT_ERR |  |
| 3006 | POP3_MEMORY_ERR |  |
| 3007 | POP3_JOBID_ERR |  |
| 3008 | POP3_NO_DATA_ERR |  |
| 3009 | POP3_DELETE_FAIL_ERR |  |
| 3010 | POP3_MAILBOX_FULL |  |

## (5) 4\#\#\#

| Error code | Contents | Solution |
| :--- | :--- | :--- |
| 4103 | During polling from main body, MIO is not active and MFP cannot <br> start communication. | Wait for a while and try transmitting again. |
| 4104 | During e-mail transmission from main body to the center, the SMTP <br> channel is not in the "Ready" status and main body cannot send e- <br> mail. | Wait for a while and try transmitting again. |
| 4105 | During polling from main body, the POP3 channel is not in the <br> "Ready" status and main body cannot receive e-mail. | Wait for a while and try transmitting again. |
| 4106 | During e-mail transmission from main body to the center, MIO is not <br> active and MFP cannot start communication. | Wait for a while and try transmitting again. |
| $41 F 9$ | Control error <br> - In the CS Remote Care's internal sequence, message transfer <br> failed. | Turn the main power switch OFF and then ON. |
| $41 F A$ | Control error | Turn the main power switch OFF and then ON. |

| Error code | Contents | Solution |
| :---: | :---: | :---: |
|  | - MIO response timed out. |  |
| 41FB | Control error <br> - As the file descriptor of the e-mail that MFP receives from MIO is invalid, MFP cannot receive the e-mail. | Turn the main power switch OFF and then ON. |
| 41FC | Control error <br> - During the creation of data to be sent by e-mail, the CS Remote Care's internal status error occurs or the data that need to be sent has not been created. | Turn the main power switch OFF and then ON. |
| 41FD | Control error <br> - During e-mail reception, the parameter sent from MIO to the CS Remote Care is invalid and MFP cannot receive the e-mail. | Turn the main power switch OFF and then ON. |
| 41FE | Control error <br> - After the completion of e-mail transmission, MFP received the transmission completion message from MIO. However, the CS Remote Care's internal status was not the status of transmission completion. | Turn the main power switch OFF and then ON. |
| 41FF | Control error <br> - During e-mail reception, MIO became inactive. | Turn the main power switch OFF and then ON. |
| 4210 | Control error <br> - E-mail sent from MIO could not be properly handled in the CS Remote Care. | Turn the main power switch OFF and then ON. |
| (6) 5\#\#\# |  |  |
| Error code | Contents | Solution |
| 5\#\#\# | MIO detects error when sending an attached file. | Check the SMTP server and POP3 server on user side. |
| (7) 6\#\#\# |  |  |
| Error code | Contents | Solution |
| 6\#\#\# | MIO detects error during a sending sequence. | Check the SMTP server and POP3 server on user side. |

### 8.3.3 When connecting by http

## NOTE

- When a code other than the ones listed below is displayed, contact KM and inform the error code.

## (1) 0\#\#\#

| Error code | Contents | Solution |
| :--- | :--- | :--- |
| O\#\#\# | Transmission error <br> $\# \# \#: ~ h t t p ~ r e s p o n d i n g ~ c o d e ~(h e x a d e c i m a l) ~$ <br> For http responding code, see RFC issued by IETF after converting <br> hexadecimal number into decimal one. | Check the user's http server system settings. <br> • Authentication setting for address of the <br> destination where the server is connected <br> • Location indicated for a folder |
| • Connection ID |  |  |

(2) 1\#\#\#

| Error code | Contents | Solution |
| :---: | :---: | :---: |
| 1030 | Machine ID mismatching <br> - Received file which tells that machine ID mismatches. | - Check the machine ID setting. <br> - Check the machine ID setting on host side. |
| 1050 | Grammar error <br> - Received file did not define the CS Remote Care command (2 digits). <br> - The Type of Subject and the command of file are not consistent. | Check file content. |
| 1061 | Modifying not allowed <br> - The host sent a command file that asked modifying data of item where setting change is not allowed. | Ask the host to send another instruction file for modifying. |
| 1062 | Modifying not available due to the copy job currently performing <br> - When informing the host that it cannot be modified due to the copy job currently performing. | Ask the host to send another instruction file for modifying. |
| 1080 | Data length problem <br> - LEN value of TEXT data and actual data length are not consistent. | Ask the host to send another instruction file for modifying. |
| 1081 | Frame No. error <br> - The last frame has not been received. <br> - There are missing frame No. | Check the status of the machine registration on host side. |

| Error code | Contents | Solution |
| :---: | :---: | :---: |
| 1082 | Subject Type problem <br> - Received code did not define the Type of Subject. | Ask the host to send another instruction file for modifying. |
| 1084 | Date expired <br> - Expiration date for data modification command has passed. | Ask the host to send another instruction file for modifying. |
| 1091 | Oversized command <br> - Received file exceeds the machine's receive buffer size. | Ask the host to send another instruction file for modifying. |
| 1099 | Illegal request <br> - Status not predicted in design is detected. | Contact KM and inform the error code. |

## (3) 2\#\#\#

| Error code | Contents | Solution |
| :---: | :---: | :---: |
| 2001 | http request result problem <br> - Internal status error | Check the user's http server system settings. <br> - Authentication setting for address of the destination where the server is connected <br> - Location indicated for a folder <br> - Connection ID <br> - Password |
| 2002 | http request result problem <br> - File list acquisition result problem |  |
| 2003 | http request result problem <br> - Request header transmission failure |  |
| 2004 | http request result problem <br> - Request body transmission failure |  |
| 2005 | http request result problem <br> - Response header receive response failure |  |
| 2006 | http request result problem <br> - Response body receive response failure |  |
| 2007 | http request result problem <br> - Session ID inconsistent |  |

8.3.4 When connecting by Fax modem

| Error code | Contents | Solution |
| :--- | :--- | :--- |
| T50 | Host terminal ID not correct | Check the telephone number set for host. |
| R80 | Serial number received from the host not correct. | Check the status of the machine registration on host <br> side. |
| R81 | Disconnection of writing instruction from host during machine is <br> running. | Wait for a while and try transmitting again. |
| R82 | Disconnection of FAX-CSRC instruction when FAX-CSRC is not <br> allowed. | Check the status of the machine registration on host <br> side. |
| R83 | Host command error. | Contact KM and inform the error code. |
| R84 | NVRAM writing error. | Contact KM and inform the error code. |

## 9. FAX TROUBLE CODE

### 9.1 The error in the transmission/reception system

- The error in the Txx/Rxx system may be caused under the effect of line noise, etc. even in usual operating condition.
- If the error occurs frequently, output the activity report, fax setting list, protocol trace list, service parameter list, address book list, group list and program list, and acquire detailed information of error status and error conditions from users. After acquiring required information, reports or lists, contact the KM support desk.

## NOTE

- Extending the timer, the transmission time will get longer, which will affect on the telephone bill to be paid by users. Additionally, for users who use fax frequently, waiting jobs are to be generated.
- Timer extension as an action to be taken for line matters must be kept to a minimum. Because there is a risk that defects will occur on other destination users.

### 9.20 T8\#

| Error code | Catego ry | Contents of error | How to correct | Installation position (Service Mode -> [FAX] -> [Line \#]) |
| :---: | :---: | :---: | :---: | :---: |
| T80 | Sendin g (Ph.A) | Telephone line connection error <br> 1. The telephone line is not connected. <br> (Disconnected due to breakage) <br> 2. The telephone line is connected to a digital line. <br> 3. The telephone line is shared with other devices. When it is being | 1. Check it again for proper connection. |  |
|  |  |  | 2. Check if the port of the telephone line is exclusively used for analog lines. <br> If it is connected to a digital line, the Dial Tone cannot be heard even when the hand set is in an off-hook state. | - |
|  |  |  | 3 . If it is shared with other devices, set to T81 and redial. | $\begin{aligned} & \text { [Function Parameter]: 000E00EE(L1), } \\ & \text { 000E01FE(L2), 000E030E(L3), } \\ & \text { 000E041E(L4) bit0: } 0->1 \end{aligned}$ |

| Error code | Catego ry | Contents of error | How to correct | Installation position (Service Mode -> [FAX] -> [Line \#]) |
| :---: | :---: | :---: | :---: | :---: |
|  |  | used by other devices, the line is detected as disconnection. |  |  |
| T81 |  | At the time of offhook, unable to detect the correct Dial Tone within the specified time <br> - The Dial Tone from the PBX or TA/ router is mismatched with the fax destination to be used. <br> - It is too late that the PBX or TA/router sends the Dial Tone. | 1. Extend the inter-station timer. (There is a PBX requiring a certain waiting time from the end of the last communication) | [Function Parameter]: 000B0010 |
|  |  |  | 2. If it requires an external transmission, conduct PBX connection settings properly. For intermittent sound, it is most likely in the PBX environment. | - |
|  |  |  | 3. Extend the Dial Tone waiting time by +2 seconds. There is a PBX from which the Dial Tone is sent too late. For backup, it is desired to record and check. | ```Function Parameter PBX DT Wait Time: 000E00AF(L1), 000E01BF(L2), 000E02CF(L3), 000E03DF(L4) >1s 1st DT Wait Time: 000E00B6(L1), 000E01C6(L2), 000E02D6(L3), 000E03E6(L4) ×1s``` |
|  |  |  | 4. Ask the carrier to change the Dial Tone frequency and pattern, or to configure settings in [Function Parameter]. | For setting method, see Function Parameter |
|  |  |  | 5. Verify the frequency of Dial Tone. Play each type of sound, search for the close one, then change the detection frequency settings. <br> (The hand set is more useful for check than the MFP monitor speaker.) | - |
|  |  |  | 6. Check the length of the Dial Tone. (For intermittent sound, check of the length regulation with the record is more effective.) (you can also check with the record which is made by the monitor speaker) | - |
| T82 |  | After dialing, unable to receive fax signal (ANSam/CED) from the remote station | 1. Check the destination. (There is a possibility that the remote station is not a fax device.) | - |
|  |  |  | 2. Extend the response waiting time by +10 ms . * If no effect is obtained, return the setting. | [Network] -> [Network Setting 2] -> [Response Waiting Time] |
|  |  |  | 3. Turn ON the monitor speaker, and check if the signal from the remote station can be heard. | - |
|  |  |  | 4. Change the lowest reception sensitivity to -43 dBm . Change the signal transmission level to -15 dBm . | - [Modem/NCU] -> [Level] -> [CD/ SED ON Level] <br> - [Modem/NCU] -> [TxATT] -> PIX TxATT, TONE/Procedure Signal TxATT, CED/ANSam TxATT |
| T83 |  | Detected Busy Tone at calling | 1. Since the remote station may be on the phone, place a time interval and redial. | - |
|  |  |  | 2. Check if the input telephone number is correct. | - |
|  |  |  | 3. Check if the telephone number is valid when being dialed from a telephone. | - |
|  |  |  | 4. Increase the number of times or the intervals of redial to make a redial soon after the end of busy state. | - |
| T84 |  | Dial error | 1. Input the destination telephone number only continuously to the external button. (Number input error is detected at PBX connection setting.) | - |
|  |  |  | 2. Turn OFF and ON the main power switch. | - |
|  |  |  | 3. Replace the fax board. | - |
| T85 |  | Detected short disconnection (line disconnection) before dialing | Check for any telephone line connection error. A breakage on underfloor wiring may be a possible cause. | - |
| T86 |  | Dial Tone continued even after dialing | See Function Parameter for setting method, and check the details of settings. <br> Details can be checked with the record which is made by the monitor speaker or telephone line. | For setting method, see Function Parameter |
|  |  |  | 2. Possibility of line defect | - |
| T89 | $\begin{aligned} & \text { Sendin } \\ & \text { g } \\ & \text { (control } \\ & \text { unit) } \end{aligned}$ | When the control unit is connected, a capacity shortage occurs during communication (To be determined before start of communication when using a coin vendor) | Check the remaining capacity of the control unit. | - |

| R60 | NonEC <br> M <br> recepti on | Amount of error lines in image data exceeded specific value (detected from MFP) | 1. Enable communication with ECM. If ECM has been already set to ON on your machine, request the sending end to do it. | [Communication] -> [Others] -> [ECM Function] |
|  |  |  | 2. Possibility of line defect (example: packet loss, distortion) | - |
| R63 | Recepti on | Received request for V. 21 signal retransmission (CRP) three times continuously Example: The remote station cannot detect retransmission signal. | 1. Change the lowest reception sensitivity to -43 dBm . Change the signal transmission level to -15 dBm . | - [Modem/NCU] -> [Level] -> [CD/ SED ON Level] <br> - [Modem/NCU] -> [TxATT] -> PIX TxATT, TONE/Procedure Signal TxATT, CED/ANSam TxATT |
|  |  |  | 2. Possibility of line defect (example: packet loss, echo, distortion, wrong control of signal conversion by exchanger) | - |
|  |  |  | 3. Acquire a log. <br> - Protocol trace list for errors <br> - Line information for both fax machine and remote station <br> - Machine management list (CSV save), activity report <br> - SysLogALL | - |
| R67 | F code recepti on (Ph.B) | Although, it has been declared with DIS that there is no SUB reception ability, but a SUB instruction is received. | It cannot be dissolved by settings, so acquire a log. <br> - Protocol trace list for errors <br> - Machine management list (CSV save), activity report | - |
| R69 | Recepti on | Received an end-ofretransmission (EOR) command from fax machine | 1. It cannot be dissolved by settings, so acquire a log. <br> - Protocol trace list for errors <br> - Line information for both fax machine and remote station <br> - Machine management list (CSV save), activity report | - |
|  |  |  | 2. Possibility of line defect (example: packet loss, echo, distortion) | - |

### 9.29 R7\#

| Error code | $\begin{gathered} \text { Catego } \\ \text { ry } \end{gathered}$ | Contents of error | How to correct | Installation position (Service Mode -> [FAX] -> [Line \#]) |
| :---: | :---: | :---: | :---: | :---: |
| R70 | Recepti on (Ph.C) | Error occurred when decoded a JBIG image data | 1. Set the coding method to $\mathrm{MH} / \mathrm{MR} / \mathrm{MMR}$. | [Communication] -> [Others] -> [Coding Ability] |
|  |  |  | 2. It cannot be dissolved by settings, so acquire a log. <br> - Original (on fax machine if possible) <br> - Protocol trace list for errors <br> - Machine management list (CSV save), activity report | - |
| R71 | NonEC M recepti on (Ph.C) | Amount of edge marks of the image data less that setting value Example: Low account of EOL regarded as RTC | 1. Enable communication with ECM. If ECM has been already set to ON on your machine, request the sending end to do it. | [Communication] -> [Others] -> [ECM Function] |
|  |  |  | 2. Set the account of EOL regarded as RTC lower. | [Function Parameter]: 000E001B bit2-0: 001 -> 000 |
| R72 | Recepti on | The reception length for a long-sized original exceeded 1000 mm . | 1. Ask the fax machine to check that no multiple pages have been read together, and to send it again. | - |
|  |  |  | 2. Request the fax machine to resend with TTI information while keeping the length within 1000 mm . | - |
| R73 |  | Fax soft error (modem control) | 1. Set the coding method to MH/MR/MMR. | [Communication] -> [Others] -> [Coding Ability] |
|  |  |  | 2. Turn OFF V.34. | [Communication] -> [Protocol] -> [V8/ V34 Protocol] |
| R74 |  | Detected HDLC frame error during image data receiving | 1. It cannot be dissolved by settings, so acquire a log. <br> - Protocol trace list for errors <br> - Machine management list (CSV save), activity report <br> - SysLogALL | - |
|  |  |  | 2. Possibility of line defect (example: packet loss, echo, distortion) | - |
| R75 |  | V. 34 communication disabled due to line noise | Turn OFF V. 34. | [Communication] -> [Protocol] -> [V8/ V34 Protocol] |
| R76 |  | V. 34 communication disabled due to line noise | Turn OFF V. 34. | [Communication] -> [Protocol] -> [V8/ V34 Protocol] |

| Error code | $\begin{gathered} \text { Catego } \\ \text { ry } \end{gathered}$ | Contents of error | How to correct | Installation position (Service Mode -> [FAX] -> [Line \#]) |
| :---: | :---: | :---: | :---: | :---: |
| R77 | Recepti on (Ph.C) | Fax soft error (image processing) | 1. Set the coding method to MH/MR/MMR. | [Communication] -> [Others] -> [Coding Ability] |
|  |  |  | 2. It cannot be dissolved by settings, so acquire a log. <br> - Original (on fax machine if possible) <br> - Protocol trace list for errors <br> - Machine management list (CSV save), activity report | - |
| R78 |  | Fax soft error (image processing control) | 1. Set the coding method to MH/MR/MMR. | [Communication] -> [Others] -> [Coding Ability] |
|  |  |  | 2. It cannot be dissolved by settings, so acquire a log. <br> - Original (on fax machine if possible) <br> - Protocol trace list for errors <br> - Machine management list (CSV save), activity report | - |
| R79 | Recepti on | Fax soft error (job control) | It cannot be dissolved by settings, so acquire a log. <br> - Original (on fax machine if possible) <br> - Protocol trace list for errors <br> - Machine management list (CSV save), activity report | - |

### 9.30 R8\#

| Error code | Catego ry | Contents of error | How to correct | Installation position (Service Mode -> [FAX] -> [Line \#]) |
| :---: | :---: | :---: | :---: | :---: |
| R80 | CSRC | Mismatched serial number from the CSRC host | Reset it from the initial transmission. | - |
| R81 |  | Received an writing instruction from the CSRC host during machine running | Acquire SysLogALL. | - |
| R82 |  | Received a FAX-CSRC instruction when FAXCSRC is not allowed | 1. Make line 1 receive the fax. | - |
|  |  |  | 2. Acquire SysLogALL. | - |
| R83 |  | Command error from the CSRC host | Acquire SysLogALL. | - |
| R84 |  | NVRAM writing error | Acquire SysLogALL. | - |

### 9.31 R9\#

| Error code | Catego ry | Contents of error | How to correct | Installation position (Service Mode -> [FAX] -> [Line \#]) |
| :---: | :---: | :---: | :---: | :---: |
| R93 | Recepti on | Mismatched password for confidential reception box | Inform the fax machine of the correct password, and ask it to rend again. | - |
| R94 |  | Mismatched relay box password Or, no relay destination found | 1. Check the relay destinations (group) in the relay box, and ask the fax machine to send again. | - |
|  |  |  | 2. Inform the fax machine of the correct password, and ask it to send again. | - |
| R96 |  | No box specified by SUB for confidential $R X$, relay RX or PC-FAX RX Or, the relay RX function disabled | 1. Check if the box for confidential RX, relay RX or PC-FAX RX has been created. | - |
|  |  |  | 2. Check if the relay function is disabled. <br> [Administrator] - [Fax Settings] - [Function Setting] - <br> [Function ON/OFF Setting] - [Relay RX] | - |
|  |  |  | 3. Contact the fax machine, and ask it to send again with the correct box number. | - |
| R97 |  | Received an PC-FAX RX indication, but the password mismatched | 1. Check the communication password for PC-FAX RX settings. | - |
|  |  |  | 2. Inform the fax machine of the correct password, and ask it to send again. | - |
| R99 | Others | The machine has issued a reception instruction command before a reception notification is sent from the fax board to the machine. | 1. Set the Receive Signal Detection Mode to No. of Times. | [Network] -> [Network Setting 1] -> [Receive Signal Detection Mode] |
|  |  |  | 2. Distribute and reduce other options of the MFP. | - |

### 9.32 Other

| Error code | Category | Contents of error | How to correct |
| :---: | :---: | :---: | :---: |
| - | Others | Despite the FAX board is installed in line 2, FAX (line 2) of [Service Mode] -> [System 2] -> [Option Board Status] is "Unset", if it is set to When the main body is in the sleep mode, line 1 can not receive faxes. | - When using the line 2 , make sure that the FAX (system) for line 2 is set up correctly. <br> - When not using the line 2 , remove all wirings of the FAX board for line 2. |
| - |  | When the main body recovers from the sleep mode while receiving a fax, the ring tone is generated more than the set number of times. (2 to 3 times) | This error is avoidable with any one of the following settings. <br> - Set [Administrator Settings] -> [System Settings] -> [Power Supply/Power Save Settings] -> [Power Consumption in Sleep Mode] to "Disabled". <br> - Set [Administrator Settings] -> [Fax Settings] -> [Line Parameter Setting] -> [Number of RX Call Rings] to "0 x". |

## 10. DIAGNOSTIC CODES

### 10.1 Outline

- The diagnostic code is a 22-digit hexadecimal code indicating a communication conditions and status.
- The diagnostic code is printed on the activity report.
- The purpose of the diagnostic code is to obtain detailed information of communication results and conditions so as to analyze communication troubles.

### 10.2 Explanation

10.2.1 The diagnostic code

| XX | XX | XX | XX | XX | XX | XX | XX | XX | XX | XX | XX | XX | XX | XX | XX | XX | XX | XX | XX | XX | XX |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $(1)$ | $(2)$ | $(3)$ | $(4)$ | $(5)$ | $(6)$ | $(7)$ | $(8)$ | $(9)$ | $(10)$ | $(11)$ | $(12)$ | $(13)$ | $(14)$ | $(15)$ | $(16)$ | $(17)$ | $(18)$ | $(19)$ | $(20)$ | $(21)$ | $(22)$ |

10.2.2 Information of communication results and conditions

| Items | Description |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | bit7 | bit6 | bit5 | bit4 | bit3 | bit2 | bit1 | bit0 |
| (1) Types of call out / called | F network (Japan) | PSTN | Dial-in (Japan) | Telephone | Group | One-touch dialing | Abbreviated dialing | Key pad dialing |
| (2) Communication mode | Sending | Error page resending | Forwarding transmission | Polled transmission | Receiving | Recovery transmission | Called turnaround | Polling RX |
| (3) Applied function specification | Mixed size transmission All pages/ cover | Frame erasure transmission | Book mode transmission | 2in1 transmission | Original size appointing TX | Upside down | Special scanning non standard/ Zfold/Long | (Not used) |
| (4) One-time communication parameter specification | Timer TX | (Not used) | CSRC | PC-Fax transmission (RX/V2) | V. 34 appoint transmission | F-code transmission | $\begin{aligned} & \text { ECM } \\ & \text { specification } \\ & \text { TX } \end{aligned}$ | International mode transmission |
| (5) Communication type | Relay | Confidential | Manual transmission | Bulletin | Line used (line 1 to 4) |  |  |  |
| (6) H_RES specification 1 (HR) | 400 dpi | 300 dpi | 200 dpi | (Not used) | 16 pels/mm | (Not used) | 8 pels/mm | (Not used) |
| (7) H_RES specification 2 (HR) | (Not used) | (Not used) | (Not used) | (Not used) | (Not used) | (Not used) | (Not used) | 600 dpi |
| (8) V_RES specification 1 | 400 dpi | 300 dpi | 200 dpi | 100 dpi | 15.4 I/mm | (Not used) | $7.7 \mathrm{I} / \mathrm{mm}$ | 3.85 I/mm |
| (9) V_RES specification 2 | (Not used) | (Not used) | (Not used) | (Not used) | (Not used) | (Not used) | (Not used) | 600 dpi |
| (10) Coding specification | (Not used) | (Not used) | (JPEG) | (JBIG) | MMR | MR | MH | THRU |
| (11) Original length specification | (Not used) | (Not used) | (Legal) | (Letter) | A3 | B4 | A4 | (Not used) |
| (12) Original length specification | (Not used) | No limits | (Legal) | (Letter) | (Not used) | B4 | A4 | (Not used) |
| (13) Speed specification 0 | (Not used) | (Not used) | (Not used) | V.29-96 | V.29-72 | (Not used) | V.27-48 | V.27-24 |
| (14) Speed specification 1 | V.17-144 | V.17-120 | V.17-96 | V.17-72 | (V.33-144) | (V.33-120) | (V.33-96) | (V.33-72) |
| (15) Speed specification 2 | V.34-192 | V.34-168 | V.34-144 | V.34-120 | V.34-96 | V.34-72 | V.34-48 | V.34-24 |
| (16) Speed specification 3 | (Not used) | (Not used) | V.34-336 | V.34-312 | V.34-288 | V.34-264 | V.34-240 | V.34-216 |
| (17) MSLT specification | (Not used) | (Not used) | (Not used) | (Not used) | (Not used) | MSLT of resolution shown as vertical RES |  |  |
| (18) Communication parameter specification | ECM frame size 0: 256 / 1: 64 | ECM | DIAG (CSRC) | (BFT) | (BTM) | PWD | SEP | SUB |
| (19) Remote station coding specification | (Not used) | (Not used) | (JPEG) | (JBIG) | MMR | MR | MH | THRU |
| (20) Remote station length specification | (Not used) | (Not used) | (Legal) | (Letter) | A3 | B4 | A4 | (Not used) |
| (21) Remote station length specification | (Not used) | No limits | (Legal) | (Letter) | (Not used) | B4 | A4 | (Not used) |
| (22) Remote station communication | (Not used) | ECM | DIAG (CSRC) | (BFT) | (BTM) | PWD | SEP | SUB |

- (Not used): bit is set to 0 .

## 11. NETWORK FAX ERROR CODE

- When there occurs any trouble with this machine, the error screen is displayed. And on this error screen, the following error message is shown. Take a necessary step referring to the table given below.

### 11.1 Error code list of the transmission system

| Error code | Category | Contents of error | Redial | Corrective action |
| :---: | :---: | :---: | :---: | :---: |
| N10 | Connection error | Server connection error | No | - Check the condition of the other party machine. <br> - Check the network setting of local machine. <br> - Ask the network administrator if the network is operating normally. |
| N11 | Connection error | Connection declined by the other party machine | No | Reception is declined. Check the condition of the other party machine. |
| N12 | Connection error | Disconnection of the line | Yes | Check to see if there occurs any abnormal condition with the network, such as the disconnection of a cable. |
| N13 | Connection error | No response received from the network | No | - Check the condition of the other party machine. <br> - Check the network setting of local machine. <br> - Ask the network administrator if the network is operating normally. |
| N14 | Connection error | Mail delivery error | No | Check the condition of the other party machine. Send it again after waiting for a while. |
| N15 | Remote reset | Connection reset by the other party machine | Yes | Check the condition of the other party machine. Send it again after waiting for a while. |
| N16 | Remote busy | Remote machine is busy | Yes | Check the condition of the other party machine. Send it again after waiting for a while. |
| N17 | LAN access | Communication time out | Yes | Check the condition of the other party machine. Send it again after waiting for a while. |
| N18 | Network error | Network error | No | - Check the each settings. <br> - Check to see if there occurs any abnormal condition with the network, such as the disconnection of a cable. <br> - After turning off and on the main power switch, send it again. |
| N20 | Memory error | Memory overflow | No | - The memory is full. <br> - Check to see if there is any other job being handled. <br> - With the number of transmission sheets reduced or the resolution for read reduced, send it again. |
| N21 | HDD error | HDD error | No | - HDD is full. <br> - Delete unnecessary files. <br> - With the number of transmission sheets reduced or the resolution for read reduced, send it again. |
| N22 | Conversion error | Conversion error | No | After turning off and on the main power switch, send it again. |
| N25 | Memory overflow | Memory overflow | No | - The memory is full. <br> - Check to see if there is any other job being handled. <br> - With the number of transmission sheets reduced or the resolution for read reduced, send it again. |
| N35 | Forward TX | A request for transmission has been received with the NetFAX with the Function Settings OFF. (A request for transfer of the IP address FAX while the IP Address FAX function is being OFF in the service mode.) | No | - |
| N36 |  | A request has been received for transmission of images that cannot be sent. | No | - |

### 11.2 Error code list of the reception system

| Error code | Category | Contents of error | Corrective action |
| :--- | :--- | :--- | :--- |
| N50 | SMTP <br> reception | SMTP reception error | When the SMTP reception does not start in 60 minutes after <br> connection for an incoming call, this error may be resulted. Ask the <br> sender to send it again. |
| N51 | Decode | In excess of the length specified for <br> reception | Ask the sender to send it again after the length of the text being <br> reduced. |

| Error code | Category | Contents of error | Corrective action |
| :--- | :--- | :--- | :--- |
| N52 | Decode | In excess of the number of pages <br> specified for reception | Ask the sender to send it again after the number of text sheets <br> being reduced. |
| N53 | Decode | File error | Ask the sender to send it again in a correct file format as shown <br> below. <br> $-\quad$ Internet Fax: TIFF <br> $-\quad$ IP Address Fax: PDF or TIFF |
| N54 | Decode | Decode error | The data has been received in an incorrect format. Ask the sender <br> to send it again in a correct format. |

## 12. Open API RELATED TROUBLE

### 12.1 Outline

- Through the Certification Management System provided by OpenAPI, if error is found in communication between the machine and interacting applications developed by company other than KM, an error message is displayed.

### 12.2 Types of Trouble

- The Certification Management System provided by OpenAPI certificates and manages communication between main body and non-KM applications that run on the computer connected to the machine. If trouble is detected, the trouble message is displayed on the control panel of the machine or the screen of the computer on which the applications run. Trouble messages displayed on the control panel of the main body and actions are described below.

## NOTE

- A message that appears on the computer screen may be different depending on the application being used for communication. The corresponding action may be different, so contact the application vendor for an appropriate action.
<Examples of trouble messages>

### 12.3 Solution

- The below describes the OpenAPI certification related trouble messages displayed on the control panel of the main body and actions, dividing them by possible situation.

### 12.3.1 When using an application

| No. | Symptom and message | Action |
| :---: | :---: | :---: |
| 1 | When starting an application, the following message is displayed: Application has expired. Failed to start the registered application. | 1. In [Administrator Settings] -> [System Settings] -> [Date/ Time Settings], check that the date and time that is set is same as the actual date and time. If a wrong date and time is set, correct it. <br> 2. Contact the application vendor and obtain a new Solution Key (or the application software itself). Using it, perform the steps below. <br> 1) Delete the application. <br> 2) Using the Solution Key (or the application software itself), register the application again. |
|  | When starting the machine, the following message is displayed: The Enhanced Server Authentication application has expired. Change the User Authentication method to one other than Enhanced Server Authentication. |  |
| 2 | When starting an application, the following message is displayed: Failed to start the registered application. Please contact your service representative. | In [Service Mode] -> [System1] -> [Marketing Area], change the marketing area of the machine to the one that was selected when the application was registered. |
|  | When starting the machine, the following message is displayed: The enhanced server authentication application cannot be used. Please contact your service representative. |  |
| 3 | In the screen saver application, after a time set, the screen saver does not work. | 1. In [Administrator Settings] -> [System Settings] -> [Date/ Time Settings], check that the date and time that is set is same as the actual date and time. If a wrong date and time is set, correct it. <br> 2. Contact the application vendor and obtain a new Solution Key (or the application software itself). Using it, perform the steps below. <br> 1) Delete the application. <br> 2) Using the Solution Key (or the application software itself), register the application again. |

| No. | Symptom and message | 3. In [Service Mode] -> [System1] -> [Marketing Area], <br> change the marketing area of the machine to the one that <br> was selected when the application was registered. |
| :---: | :---: | :---: |

### 12.3.2 After rewriting the firmware of the machine

| No. | Symptom and message | Action |
| :---: | :--- | :--- |
| 1 | When starting an application, the following message is <br> displayed: Failed to start the registered application. Please <br> contact your service representative. | After deleting the application in question, register the <br> application again. |
|  | When starting the machine, the following message is displayed: <br> The enhanced server authentication application cannot be <br> used. Please contact your service representative. |  |
|  | In the screen saver application, after a time set, the screen <br> saver does not work. |  |

## 13. TROUBLES THAT DO NOT DISPLAY THE TROUBLE CODE

13.1 Machine is not energized at all (DCPU operation check) (bizhub C658/C558/C458/C368/C308/C258)

### 13.1.1 Contents

| Trouble type | Machine is not energized at all |
| :--- | :--- |
| Rank | - |
| Trouble detection condition | - |
| Trouble isolation | - |
| Relevant electrical parts | - Main power switch (SW1) <br>  <br>  <br>  <br>  •MFP board (MFPB) |

### 13.1.2 Procedure

| Step | Check item | Location of electrical component | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Is a power voltage supplied across CN1-1 and 2 on DCPU? | $\begin{gathered} \mathrm{C} 368 / \mathrm{C} 308 / \mathrm{C} 258 \\ \text { 19-T } \\ \text { C658/C558/C458 } \\ \text { 15-S } \end{gathered}$ | NO | Check the WIRING from the wall outlet to SW1 to CN1. |
| 2 | Are the fuses on DCPU conducting? | - | NO | Replace DCPU. (bizhub C368/C308/ C258 / bizhub C658/C558/C458) |
| 3 | Is DC5 V being output from CN6-5 on DCPU? | $\begin{gathered} \mathrm{C} 368 / \mathrm{C} 308 / \mathrm{C} 258 \\ \text { 19-R } \\ \text { C658/C558/C458 } \\ \text { 17-S } \end{gathered}$ | NO | Replace DCPU. (bizhub C368/C308/ C258 / bizhub C658/C558/C458) |
| 4 | Is DC24 V being output to CN7-3 on DCPU? | $\begin{gathered} \mathrm{C} 368 / \mathrm{C} 308 / \mathrm{C} 258 \\ \text { 19-R } \\ \text { C658/C558/C458 } \\ \text { 18-S } \end{gathered}$ | NO | - Check the WIRING from the wall MFPB to DCPU. <br> - Replace DCPU. (bizhub C368/C308/ C258 / bizhub C658/C558/C458) <br> - Replace MFPB. (bizhub C368/C308/ C258 / bizhub C658/C558/C458) |
| 5 | The LED on MFPB is blinking? | - | NO | Replace MFPB. (bizhub C368/C308/ C258 / bizhub C658/C558/C458) |
| 6 | Is DC24 V being output to CN7-1 on DCPU? | $\begin{gathered} \text { C368/C308/C258 } \\ \text { 19-R } \\ \text { C658/C558/C458 } \\ \text { 18-S } \end{gathered}$ | NO | Replace DCPU. (bizhub C368/C308/ C258 / bizhub C658/C558/C458) |

- N. 1 bizhub C368/C308/C258
- N. 2 bizhub C658/C558/C458

### 13.2 Fusing heaters do not operate (bizhub C658/C558/C458/C368/C308/C258)

### 13.2.1 Contents

| Trouble type | Fusing heaters do not operate |
| :--- | :--- |
| Rank | - |
| Trouble detection condition | - |
| Trouble isolation | - |
| Relevant electrical parts | - Main power switch (SW1) |
|  | - Right door switch (SW3) |
|  | •DC power supply (DCPU) |
|  | - MFP board (MFPB) |
|  | • Fusing unit |

### 13.2.2 Procedure

| Step | Check item | Location of electrical <br> component | Result | Action |
| :---: | :--- | :---: | :---: | :--- |
| 1 | Is a power voltage supplied across CN8-5 on <br> DCPU? <br> During this time, the right door should be closed. | C368/C308/C258 <br> 17-R <br> C658/C558/C458 15 <br> to 16-Q | NO | Check wiring from power outlet to SW1 to <br> CN8 to SW3. |
| 2 | Is the power source voltage applied across <br> MFPB CN13E-6, 9? (bizhub C368/C308/C258) | C368/C308/C258 <br> $11-E$ | YES | Replace the fusing unit. |
|  |  | NO | Replace DCPU. <br> Replace MFPB. |  |
| 3 | Is the power source voltage applied across <br> MFPB CN13E-4, 6 (bizhub C658/C558), MFPB <br> CN12E-6, 9 (bizhub C458)? (bizhub C658/C558/ <br> C458) | C658/C558/C458 23 <br> to 24-C | YES | Replace the fusing unit. (bizhub C658/ <br> C558 / bizhub C458) |
|  |  | NO | Replace DCPU. <br> Replace MFPB. |  |

- N. 1 bizhub C368/C308/C258
- N. 2 bizhub C658/C558/C458

### 13.3 Power is not supplied to DF (bizhub C658/C558/C458)

### 13.3.1 Procedure

| Step | Check item | Location of electrical <br> component | Result | Action |
| :---: | :--- | :---: | :---: | :--- |
| 1 | Is DC24 V being output from CN1 on DF? | $13-1$ | YES | Malfunction in DF. |
| 2 | Is DC24 V being output from CN004-1 on <br> DCPU? | $17-Q$ | NO | Check wiring from DCPU to DF. |
| 3 | Is the fuse on DCPU conducting? | - | YES | Replace DCPU. |
|  |  |  | NO | Malfunction in DF. |

- N. 3 Dual scan document feeder

### 13.4 Power is not supplied to option

### 13.4.1 DF-704/DF-629

(1) Procedure

| Step | Check item | Location of <br> electrical <br> component | Result | Action |
| :---: | :--- | :---: | :---: | :--- |
| 1 | Is DC24 V being output from CN1DF-1 on DF? | $15-I$ | YES | Malfunction in DF-704/DF-629. |
| 2 | Is DC24 V being output to CN4-1 on DCPU? | $18-R$ | NO | Check wiring from DCPU to DF-704/ <br> DF-629. |
| 3 | Is the fuse on DCPU conducting? | - | YES | Replace DCPU. |
|  |  |  | NO | Malfunction in DF-704/DF-629. |

- N.4.16 FS-537/FS-537SD

## 14. OTHER TROUBLE

### 14.1 Firmware error warning

- Warning message: A firmware error occurred.
- While the enhanced security mode is enabled, if MFP is restarted by turning the main power switch OFF and ON or other operations, selftesting is performed internally. If the self-testing detects firmware error, this warning appears.

### 14.1.1 Action

1. Set Enhanced Security Mode to "OFF" in Administrator Settings and touch "OK."
2. Turn OFF and ON the main power switch.
3. Check that the warning screen is not displayed.
4. Rewrite the firmware.
5. Set the Enhanced Security Mode.

### 14.2 HDD lock password error warning

### 14.2.1 Detection timing

- Warning message: Reset HDD Lock Password.
- There is a mismatch between the password registered in the HDD and that registered in the main body.
- Wrong machine type information is input.

### 14.2.2 Action

(1) Checking the machine type information

NOTE

- Perform the following steps, if this malfunction occurs when the MFP board is replaced with a new one.
- Prepare a USB flash drive in which firmware data is recorded.

1. Call the firmware update selection screen to the display. NOTICE

- USB memory

2. Touch [Machine Type Select].
3. Check the setting values of [Machine] and [Type] and enter the correct setting values. For details, see "USB memory".
4. Turn OFF and ON the main power switch. If a USB flash drive has been used, first remove the USB flash drive and then turn ON the main power switch.

## (2) Re-registering the correct HDD Lock Password

1. Touch Menu.
2. Touch [Utility].
3. Touch [Administrator Settings].
4. Enter the administrator password and touch [OK].
5. Enter the currently set HDD Lock Password twice.
6. Touch [OK].
7. When the screen that indicates the completion of setting of the HDD Lock Password appears, turn OFF and ON the main power switch.

## (3) Performing HDD Physical Format

1. Call the Service Mode to the screen.
2. Touch these keys in this order: [State Confirmation] -> [Memory/Storage Adjustment] -> [Format].
3. Touch [Physical Format].
4. Press the Start key.
5. When Physical Format is completed, turn OFF and ON the main power switch.

## 15. TROUBLESHOOTING OF i-Option

### 15.1 Structure of license management

- The functions available with i-Option can be activated by entering "License code" to the main body.
- License code is issued and controlled by License Management System (LMS).

To prevent unauthorized use of the license code, each main body is identified individually so that the license code cannot be activated unless it matches with the authorized the main body.

### 15.2 License management information

- Since license code needs to identify each main body, it is issued using the serial number of main body and "unique value" that is generated inside the main body.
- The "unique value" is stored to the memory region on the MFP board and at the same time some parts of it are memorized by eMMC board and EEPROM. The activated function cannot be used unless the both figures conform.
Since these figures are out of target of [Memory Data Backup], when any trouble occurs at either nonvolatile memory, "License Management Error" is generated due to discordance of the figures.

### 15.3 Error message

### 15.3.1 License management error

- When abnormal value is detected in the license management information that is stored to the MFP board, eMMC board or EEPROM, or some values are detected cleared, warning is issued to let the user know the abnormality.
- The abnormality is detected at the timing of start-up or restart due to any condition.
- When the abnormality is detected, the corresponding i-Option function cannot be used, other ordinal functions, however, such as copy, scanning, print or etc, can be used without interruption. (Error message is displayed on the Service Mode screen.)
(1) Example of error message

(2) Main reasons of trouble
- The following shows the possible trouble factors and their countermeasure.

| Board replacement | Countermeasure |
| :--- | :--- |
| When MFP board and eMMC board or EEPROM are replaced with <br> the new ones at the same time. | Install firmware, follow the setup procedure. |
| When mounting the MFP board of the machine whose function(s) <br> have already been activated and a new eMMC board or EEPROM. | Install firmware, then restore the data using restore procedure. |

## 16. IMAGE QUALITY PROBLEM

### 16.1 How to read element data

- As part of troubleshooting procedures, the numeric values set for "State Confirmation" available from "Service Mode" can be used to isolate the cause of the image problem.

16.1.1 Table Number

| State Confirmati |  |  |  |  |  |  |  | END |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\square$ Table No. |  |  |  |  |  |  |  |  |  |
| $1$ | LD Ligh | value | Chargingac |  | Chargingat |  |  |  |  |
|  | C | 1938 | Upp-C1 | 1693 | Upp-C2 | 0 | 1 | 2 | 3 |
|  | M 1569 |  | Upp-M1 | 1893 | Upp-M2 | 0 |  |  |  |
|  | Y | 1740 | Upp-Y1 | 1893 | Upp-Y2 | 0 | 4 | 5 | 6 |
|  |  |  | Upp-K1 |  | Upp-K2 | 0 | 7 | 8 | 9 |
|  |  |  |  |  |  |  | * | 0 | \# |
|  |  |  |  |  |  |  |  |  |  |

| Vdc-C <br> Vdc-M <br> Vdc-Y <br> Vdc-K | - Shows the developing bias value of toner when an image is produced. <br> - Standard values: around 300 V to $400 \mathrm{~V}(100 \mathrm{~V}$ to 800 V$)$ <br> - The specific numeric values vary with different developing units. (The values incorporate corrections to match the proper density after image stabilization.) <br> - If the value is high: It is decided that the image density is low by the IDC detection, and the value is corrected high. <br> - If the value is low: It is decided that the image density is high by the IDC detection, and the value is corrected low. <br> - Relevant components: Developing unit, drum unit, high voltage unit (HV) |
| :---: | :---: |
| Vg-C <br> Vg-M <br> Vg-Y <br> Vg-K | - Shows the grid voltage value of each color of toner when an image is produced. <br> - Standard values: around 450 V to $550 \mathrm{~V}(200 \mathrm{~V}$ to 1000 V$)$ <br> - The specific numeric values vary with different developing units. (The values incorporate corrections to match the proper density after image stabilization.) <br> - If the value is high: It is decided that the image density is low by the IDC detection, and the value is corrected high. <br> - If the value is low: It is decided that the image density is high by the IDC detection, and the value is corrected low. <br> - Relevant components: Developing unit, drum unit, high voltage unit (HV) |
| LD Light Value (C, M, Y, K) | - Shows the LD light value of each color of toner during print image formation. <br> - Standard values: around 1500 to 2200 (1400 to 3600) <br> - For your information, photoconductor durability tends to be aggravated and fine line width tends to be broader at higher values and characters tend to be faint at lower values. <br> - Relevant components: PH unit, drum unit |
| Charging AC Output Value1 <br> Vpp-C1 <br> Vpp-M1 <br> Vpp-Y1 <br> Vpp-K1 | - Shows the AC voltage value applied to the charging roller of each color of toner during print image formation. <br> - Standard values: around 1750 V to $1800 \mathrm{~V}(500 \mathrm{~V}$ to 2500 V ) <br> - Relevant components: Drum unit, high voltage unit (HV) |
| Charging AC Output Value2 <br> Vpp-C2 <br> Vpp-M2 <br> Vpp-Y2 <br> Vpp-K2 | - Shows the current value applied to the charging roller of each color of toner during print image formation. <br> - Standard values: around 120 to 145 (0 to 350) <br> - Relevant components: Drum unit, high voltage unit (HV) |

16.1.2 Level History 1

### 16.2 Troubleshooting procedure overview

### 16.2.1 Test pattern printing

- Following give an overview of a procedure to isolate a faulty spot of an image trouble using a test pattern.
- A faulty spot that is responsible for an image trouble is isolated by printing a test pattern to determine whether an image trouble is evident and determining which color of toner, $\mathrm{Y}, \mathrm{M}, \mathrm{C}$, or K , has the trouble.

## (1) Scanner system image trouble

- If an image trouble occurs during a copy cycle, use the image trouble that may be evident on the test pattern printed to determine whether the trouble is attributable to the scanner system or the printer system
- If no image trouble occurs on a test pattern produced following a print cycle, the image trouble is determined to be attributable to the scanner system.

| $[1]$ | Scanner system | $[2]$ | Printer system |
| :--- | :--- | :--- | :--- |
| $[3]$ | Document scan | $[4]$ | CCD board (CCDB) |
| $[5]$ | I/F cable (when DF-629 is mounted; and only for the front <br> side for bizhub C368/C308/C258 mounted with DF-704 <br> and for bizhub C658/C558/C458) | $[6]$ | MFP board (MFPB) |
| $[7]$ | PH relay board (PHRYB) | $[8]$ | Print output |
| $[9]$ | DF-629 / DF-704 / Dual scan document feeder | $[10]$ | CIS module (CIS) |
| $[11]$ | Dual scan image processing board (DSIPB) | I/F cable (only for the back side for bizhub C368/C308/ <br> C258 mounted with DF-704 and for bizhub C658/C558/ <br> C458) |  |

## (2) Printer system image trouble

- If the image trouble is attributable to the printer system, determine whether the image trouble occurs with one to three colors, or with four colors of $\mathrm{Y}, \mathrm{M}, \mathrm{C}$, and K .
- If the same image trouble occurs with four colors, the image trouble is determined to be that of the four-color system.

$\begin{array}{|l|l|l|}\hline \text { [1] Faulty spot responsible for an image trouble of the } \\ \text { single-to- three-color system }\end{array} \quad$ [2] $\left.\begin{array}{l}\text { Faulty spot responsible for an image trouble of the four- } \\ \text { color system }\end{array}\right]$

### 16.2.2 Self-diagnostic function

Following give an overview of the self-diagnostic function.

- The self-diagnostic function makes a self-diagnosis of printed-wiring boards and electrical parts to determine whether they are fully operational.
- Two methods are provided to activate the self-diagnostic function. The details are shown as follows: [Service Mode] -> [State Confirmation] -> [Self-diagnostic] -> [Check All].
- Procedure (from SERVICE MODE menu)
- Procedure (from main power switch ON)
- When the self-diagnostic procedure is completed, "OK" or "NG" appears on the display. If "NG" appears, check the corresponding printedwiring board for proper connector connection or replace a faulty board with a good one.
- After completing the self-diagnostic, "Self-diagnosis result report" can be printed out. (Only when starting the self-diagnostic from main power switch ON.)
Self-diagnostic (Check AII) screen: Example

## (1) Causes and countermeasures

| Check name | Cause of "NG" display | Corrective action |
| :--- | :--- | :--- |
| DIMM R/W Check | DIMM improperly installed, faulty DIMM, faulty CPU of MFP <br> board | Reinstall the DIMM, replace the DIMM, replace <br> the MFP board |
| On Board Memory Check | Faulty MFP board, run-down battery | Replace the MFP board |
| SSD Check | RMMC board improperly installed, faulty eMMC board, faulty <br> MFP board | Reinstall the eMMC board, replace the eMMC <br> board, replace the MFP board |

| HDD Check | Broken HDD cable, damaged HDD, faulty MFP board | Replace the HDD cable, replace the HDD, <br> replace the MFP board |
| :--- | :--- | :--- |
| Compress/Decompression <br> Check | Faulty MFP board, improperly connected dual scan image <br> processing board | Reinstall the dual scan image processing board, <br> replace the dual scan image processing board, <br> replace the MFP board |
| Memory Bus Check: <br> Output image | Improperly connected MFP board, faulty MFP board | Replace the MFP board |

### 16.3 Corrective action procedure (bizhub C658/C558/C458/C368/C308/C258)

### 16.3.1 Image trouble sample illustrations

## NOTE

- Sample illustrations schematically show exemplary image troubles that occur when the images are printed on A3-size paper.
- The arrow in the exemplary image troubles indicates the paper feeding direction.

Skewed image/Image deviation

Color line 2, Color band 2

Gradation reproduction failure

Uneven gloss, Rough gloss

ACS malfunction

Uneven density 1

Color reproducibility error

Poor fusing performance

Blurred fine lines

Abnormal image

Color line 1, Color band 1

Uneven density 2

Incorrect color image registration

Brush effect

Distorted image

### 16.3.2 Skewed image/Image deviation

## (1) Typical faulty images

The arrow in the exemplary image troubles indicates the paper feeding direction.
[1]

[2]

[1]

## (2) Troubleshooting procedure

## Flowchart for isolating the cause area

- The figure below is a flowchart for isolating the cause area of image deviation / skewed image (four main cause areas are covered).
- After isolating the cause area according to the flowchart, please perform the troubleshooting described on the next page for each cause area.

## Troubleshooting steps for each cause area

 NOTE- If the problem can not be solved after "(1) First steps of troubleshooting," check "(2) Individual adjustment items".
" In "(2) Individual adjustment item," perform adjustment and test according to the manual description procedure of each item

## < ADF >

(1) First steps of troubleshooting

| Step | Content |
| :---: | :--- |
| 1 | Check the set position of original and document width guide, and correct it if needed. |
| 2 | Check the paper path, and remove any paper pieces or foreign matters. |
| 3 | Check each roller for dirt and wear, and clean or replace it if needed. |

| Step | Content |
| :---: | :--- |
| 4 | If there is looseness in the screw of the ADF hinge part, fix it and perform the installation settings of ADF. (Mount <br> DF-629, Mount DF-704) |
| 5 | Perform test printing/scanning to check whether the problem has been resolved. <br> If it can not be resolved, confirm "(2) individual adjustment items". |

(2) Individual adjustment items

| Skewed image | 1. ADF adjusting the height <br> Adjusting the height <br> Adjusting the height (DF-629) <br> Adjusting the height (DF-704) |
| :--- | :--- |
|  | 2. Skew Measurement |
|  | 3. Registration Loop Adj. <br> (Perform this item only if the problem is not resolved by adjustment 1 and 2.) |
| Image deviation | 1. Feed Zoom |
|  | 2. FD-Mag. Adj. (B) <br> 3. Auto Stop Position Adjustment <br> (Before performing this adjustment, adjustment 1 and 2 needs to be completed.) |

## NOTE

- If the trouble can not be solved by the above adjustment, replace the CCD unit. CCD board (CCDB) (C368/C308/C258) / CCD board (CCDB) (C658/C558/C458)
- When using DF-704 (dual scan document feeder), if there is a problem only on the back side image after the above adjustment, replace the CIS module. CIS module (CIS) (dual scan document feeder)
< Scanner (IR) >
(1) First steps of troubleshooting

| Step | Content |
| :---: | :--- |
| 1 | Check the set position of original, and correct it if needed. |
| 2 | When using a thick original (like a book), check whether the user strongly presses the document cover/ADF. *The <br> scanner section may not move smoothly due to the excessive pressure, and which may cause image deviation. |
| 3 | If original glass is not installed properly, reinstall original glass. |
| 4 | Perform test printing/scanning to check whether the problem has been resolved. <br> If it can not be resolved, confirm "(2) individual adjustment items". |

(2) Individual adjustment items

| Skewed image | Mechanical adjustment: Print Head Skew Adj. (C658/C558/C458) |
| :--- | :--- |
| Image deviation | Scan Area |

## NOTE

If the trouble can not be solved by the above adjustment, replace the CCD unit. CCD board (CCDB) (C368/C308/C258) / CCD board (CCDB) (C658/C558/C458)
< Paper feed tray >
(1) First steps of troubleshooting

| Step | Content |
| :---: | :--- |
| 1 | Correct the paper settings, if the paper size/type in the tray and the paper settings selected on the machine are not <br> matched. |
| 2 | Check the set position of paper or paper length guide / paper width guide, and correct it if needed. <br> *For a paper tray that uses only a specific paper size, it is possible to fix the paper width guide to a specific paper size <br> position by attaching a screw to the screw hole on the paper width guide (back side). It is possible to prevent problems <br> due to wrong paper setting, but be careful as users will not be able to change paper sizes by themselves. |
| 3 | Check the paper path and the back side of the tray, and remove any paper pieces or foreign matters. |
| 4 | Check each roller for dirt and wear, and clean or replace it if needed. |
| 5 | Perform test printing to check whether the problem has been resolved. <br> If it can not be resolved, confirm "(2) individual adjustment items". |

(2) Individual adjustment items

| Skewed image | Printer Reg. Loop Adj. |
| :--- | :--- |
| Image deviation | Printer Area * If the image deviation in the main scan direction (side edge) can not be adjusted completely, <br> perform the mechanical adjustment on below for the affected tray. |
|  | Mechanical adjustment: Centering adjustment of the tray $1 / 2$ Centering adjustment of the tray $1 / 2$ (C368/C308/ <br> C258)/Centering adjustment of the tray $1 / 2$ (C658/C558/C458) |
|  | Mechanical adjustment: Paper reference position Paper reference position (PC-100/PC-210)/Paper reference <br> position (PC-115/CP-215)/Paper reference position (PC-410/PC-415) |

## NOTE

* If the trouble can not be solved by the above adjustment, check the Paper transport section.
< Paper transport section >
(1) First steps of troubleshooting

| Step | Content |
| :---: | :--- |
| 1 | Check the set position of paper or paper length guide / paper width guide, and correct it if needed. <br> *For a paper tray that uses only a specific paper size, it is possible to fix the paper width guide to a specific paper size <br> position by attaching a screw to the screw hole on the paper width guide (back side). It is possible to prevent problems <br> due to wrong paper setting, but be careful as users will not be able to change paper sizes by themselves. |
| 2 | If the Right door unit / Regist unit (inner door on the vertical transport section) is half-open, make it correct position. |
| 3 | Check the paper path, transport rollers, and registration section, and remove any paper pieces / foreign matters / paper <br> dust. |
| 4 | Perform test printing to check whether the problem has been resolved. <br> If it can not be resolved, confirm "(2) individual adjustment items". |

(2) Individual adjustment items

| Skewed image | Printer Reg. Loop Adj. |
| :--- | :--- |

## NOTE

* If the trouble can not be solved by the above adjustment, reinstall the Right door unit /Regist unit. Right door unit (C358/C308/C258)/Right door unit (C658/C558/C458)/Regist unit (C358/C308/C258)/Regist unit (C658/C558/C458)
16.3.3 White line 1, White band 1, Color line 1, Color band 1

## (1) Typical faulty images

The arrow in the exemplary image troubles indicates the paper feeding direction.

(2) Initial troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Paper Setting | The paper to be used for printing does not match the paper type and size of paper setting selected on the machine. | YES | Make the paper setting again on the machine. |
| 2 | Service Mode -> Stabilizer | Select [Service Mode] -> [Imaging Process Adjustment] -> [Stabilizer] -> [Stabilization Only] and the image trouble is eliminated. | NO | Go to the next step. |
| 3 | Service Mode -> Gradation Adjust | Select [Service Mode] -> [Imaging Process Adjustment] -> [Gradation Adjust] and the image trouble is eliminated. | NO | Go to the next step. |
| 4 | Image check | - Select [Service Mode] -> [Test Mode] -> [Halftone Pattern]. Select "SINGLE", "HYPER", "Gradation", "1-Sided", "CMYK", and "Full Bleed", enter "64" for Density, and load tray 2 with A3 paper. Press the start key. This runs a print cycle for $\mathrm{C}, \mathrm{M}, \mathrm{Y}$, and K in that order. <br> - Check the image after printing to determine which color causes the abnormal image. | 1 to 3 colors | Go to the 1-color troubleshooting procedure. |
|  |  |  | $\begin{array}{\|c\|} \hline 4 \\ \text { colors } \end{array}$ | Go to the 4-color troubleshooting procedure. |
|  |  |  | Not availab le | Go to scanner troubleshooting procedure. |

(3) 1-color troubleshooting procedure

| Step | Section | Check item for the faulty color | Result | Action for the faulty color |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Service Mode -> Table Number | Select [Service Mode] -> [State Confirmation] -> [Table Number]. The measured value is close to the standard value. <br> - Developing bias: Vdc-C, Vdc-M, Vdc-Y, Vdc-K: close to the standard value of 300 V to 400 V (100 V to 800 V ) <br> - Grid voltage: Vg-c, $\mathrm{Vg}-\mathrm{M}, \mathrm{Vg}-\mathrm{Y}, \mathrm{Vg}-\mathrm{K}$ : close to the standard value of 450 V to $550 \mathrm{~V}(200 \mathrm{~V}$ to 1000 V$)$ | NO | - Check the high voltage unit, developing unit, and the drum unit for wiring and connection. <br> - Replace the high voltage unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) |
| 2 | Write section | Sharp white line or colored line is blurry. | YES | Clean the PH window. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |
| 3 | Charging section | Foreign matter on charging roller. | YES | Lightly wipe the surface clean of foreign matter using hydro-wipe (65AA-99\#\#). |

| Step | Section | Check item for the faulty color | Result | Action for the faulty color |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Note: Do not apply a strong force to the surface of the charging roller, as doing so can damage the surface. |
| 4 | Photo conductor section | There is a positive contact between the electrostatic charger application terminals and the high voltage unit connection terminals. | NO | Clean or correct the terminal. |
| 5 | Developing section | There is a positive contact between the developing bias application terminals and the high voltage unit connection terminals (Y: B4; M: B3; C: B2; K: B1). | NO | Clean or correct the terminal. |
| 6 | Photo conductor section | Scratches on photo conductor. | YES | - Clean. <br> - Replace the drum unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 7 | Photo conductor section | Toner line or dirt on photo conductor. (improper cleaning) | YES | Replace the drum unit. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |
| 8 | Photo conductor section | Faint lines evident on the entire surface as if the surface were brushed off. | YES | - Select [Service Mode] -> [Counter] -> [Life] and check the counter value of the Drum Unit. <br> - Replace the drum unit having the greatest counter value with a new one. (bizhub C368/C308/C258 / bizhub C658/C558/C458) (Not the drum unit of the color that has developed the lines, but the drum unit having the greatest counter value) |
| 9 | 1st transfer section | There is a positive contact between the transfer belt application terminals and the high voltage unit connection terminals (Y: T1-4; M: T1-3; C: T1-2; K: T1-1). | NO | Clean or correct the terminal. |
| 10 | 1st transfer section | Scratches or dirt on 1st transfer roller. | YES | - Clean. <br> - Replace the transfer belt unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 11 | Developing section | Toner bristles not even on the developing roller, resulting in a line or band. | YES | Replace the developing unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
|  |  |  | NO | Replace the PH unit. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |

(4) 4-color troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Paper path | There is dirty or foreign matter on paper path. | YES | Check or clean the paper path including the duplex section. |
| 2 | Transfer belt unit | Lines that can be removed by cleaning are evident on the transfer belt. (improper cleaning) | YES | - Check or clean the cleaning blade. <br> - Replace the transfer belt unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 3 | Transfer belt unit | Dirt, scratches, or foreign matter on the transfer belt. | YES | - Clean. <br> - Replace the transfer belt unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 4 | Transfer belt unit | There is a positive contact between the transfer belt application terminals and the high voltage unit connection terminals (Y: T1-4; M: T1-3; C: T1-2; K: T1-1). | NO | Clean or correct the terminal. |
| 5 | 2nd transfer section | Dirt or foreign matter on the 2nd transfer roller. | YES | - Remove the foreign matter. <br> - Replace the transfer roller unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) |

| Step | Section | Check item | Result | Action |
| :---: | :--- | :--- | :--- | :--- |
| 6 | 2nd transfer section | There is a positive contact between the application <br> terminals of the 2nd transfer and the connection <br> terminals (T2, E) and ground terminal of the high <br> voltage unit. | NO | Clean or correct the terminal. |
| 7 | Fusing unit | There is dirty or foreign matter on paper path of fusing <br> unit. | YES | Clean. (Disassembling the fusing <br> unit is prohibited.) |
| 8 | Fusing unit | Scratches on belt and roller in fusing unit. | YES | Replace the fusing unit. (bizhub <br> C368/C308/C258 / bizhub C658/ <br> C558 / bizhub C458) |

## (5) Scanner troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Original | Original is damaged or dirty. | YES | Change the original. |
| 2 | When original glass is being used | A fault occurs in the image read through the original glass. | YES | Go to step 6. |
| 3 | When DF is being used: 1st side | A fault occurs in the image read from the 1st side while DF is being used. | YES | Go to step 12. |
| 4 | When DF-629 is being used: 2nd side | A fault occurs in the image read from the 2nd side while DF-629 is being used. | YES | Go to step 12. |
| 5 | DF-704 or dual scan document feeder is being used: 2nd side | A fault occurs in the image read from the 2nd side while DF-704 or dual scan document feeder is being used. | YES | Go to step 20. |
| Main body side_original glass |  |  |  |  |
| 6 | DF side_Original pad | Original pad of DF is dirty. | YES | Clean. |
| 7 | Original glass | Original glass is dirty. | YES | Clean. |
| 8 | Shading sheet | Shading sheet is dirty. | YES | Clean. |
| 9 | End face of original is reproduced as a line | Select [Service Mode] -> [Machine] -> [Scan Area] -> [Scanner Image Side Edge] and make the necessary adjustment, and the image trouble is eliminated. | NO | Go to the next step. |
| 10 | Line occurring due to faulty shading | Select [Service Mode] -> [Machine] -> [Scan Area] -> [Image Position: Leading Edge] and make the necessary adjustment, and the image trouble is eliminated. | NO | Go to the next step. |
| 11 | Parts along scanning | Mirror, lens, light guide or reflectors is dirty. | YES | Clean. |
|  |  |  | NO | - Replace the LED exposure unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) <br> - Replace the CCD unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| Main body side_DF original reading section |  |  |  |  |
| 12 | Main body side_reading section | Document reading glass of main body is dirty. | YES | Clean. |
| 13 | DF side_document reading glass cleaning brush | Document reading glass cleaning brush of DF is dirty. | YES | Clean. |
| 14 | Main body side_shading sheet | Shading sheet of main body is dirty. | YES | Clean. |
| 15 | When DF is being used: 2nd side: End face of original is reproduced as a line | Select [Service Mode] -> [ADF] -> [Original Stop Position] -> [Sub Scanning Direction 1-Side] and make the necessary adjustment, and the image trouble is eliminated. | NO | Go to the next step. |
| 16 | When DF-629 is being used: 2nd side: end face of original is reproduced as a line | Select [Service Mode] -> [ADF] -> [Original Stop Position] -> [Sub Scanning Direction 2-Side] and make the necessary adjustment, and the image trouble is eliminated. | NO | Go to the next step. |
| 17 | Service Mode -> Read Pos Adj | Select [Service Mode] -> [ADF] -> [Read Pos Adj] -> [Auto Adjust] and the image trouble is eliminated. | NO | Go to the next step. |

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 18 | Line occurring due to faulty shading | Select [Service Mode] -> [Machine] -> [Scan Area] -> [Image Position: Leading Edge] and make the necessary adjustment, and the image trouble is eliminated. | NO | Go to the next step. |
| 19 | Parts along scanning path | Mirror, lens, light guide or reflectors is dirty. | YES | Clean. |
|  |  |  | NO | - Replace the LED exposure unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) <br> - Replace the CCD unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| DF-704 or dual scan document feeder side_original reading section |  |  |  |  |
| 20 | CIS glass cleaning | CIS glass is dirty. | YES | Clean. |
| 21 | CIS reading section | CIS reading section is dirty. | YES | Clean. |
| 22 | CIS cleaning brush | CIS cleaning brush is dirty. | YES | Clean. |
| 23 | Shading sheet | Shading sheet is dirty. | YES | Clean. |
| 24 | When DF-704 or dual scan document feeder is being used: 2nd side: End face of original is reproduced as a line | Select [Service Mode] -> [ADF] -> [Original Stop Position] -> [Sub Scanning Direction 2-Side] and make the necessary adjustment, and the image trouble is eliminated. | NO | Go to the next step. |
| 25 | When DF-704 or dual scan document feeder is being used: 2nd side: Home Read Position | Select [Service Mode] -> [ADF] -> [Home Read Position Adjust] and the image trouble is eliminated. | NO | Go to the next step. |
| 26 | Scanning section | CIS reading section is dirty. | YES | Clean. |
|  |  |  | NO | Replace the CIS module. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |

### 16.3.4 White line 2, White band 2, Color line 2, Color band 2

## (1) Typical faulty images

The arrow in the exemplary image troubles indicates the paper feeding direction.

| 4 | Photo conductor section | There is a positive contact between the electrostatic charger application terminals and the high voltage unit connection terminals. | NO | Clean or correct the terminal. |
| 5 | Developing section | There is a positive contact between the developing bias application terminals and the high voltage unit connection terminals (Y: B4; M: B3; C: B2; K: B1). | NO | Clean or correct the terminal. |
| 6 | Photo conductor section | Scratches on photo conductor. | YES | - Clean. <br> - Replace the drum unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 7 | Photo conductor section | Toner line or dirt on photo conductor. (improper cleaning) | YES | Replace the drum unit. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |
| 8 | 1st transfer section | There is a positive contact between the transfer belt application terminals and the high voltage unit connection terminals (Y: T1-4; M: T1-3; C: T1-2; K: T1-1). | NO | Clean or correct the terminal. |
| 9 | 1st transfer section | Scratches or dirt on 1st transfer roller. | YES | - Clean. <br> - Replace the transfer belt unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 10 | Developing section | Toner bristles not even on the developing roller, resulting in a line or band. | YES | Replace developing unit. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |
|  |  |  | NO | Replace the PH unit. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |

## (4) 4-color troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :--- | :--- | :--- | :--- |
| 1 | Paper path | There is dirty or foreign matter on paper path. | YES |  |
| 2 | Transfer belt unit | Lines that can be removed by cleaning are evident on <br> the transfer belt. (improper cleaning) <br> including the duplex section. |  |  |
| 3 | Transfer belt unit | Dirt, scratches, or foreign matter on the transfer belt. | YES <br> - <br> Check or clean the cleaning <br> blade. <br> Replace the transfer belt unit. <br> (bizhub C368/C308/C258 / <br> bizhub C658/C558/C458) |  |
| 4 | Transfer belt unit | There is a positive contact between the transfer belt <br> application terminals and the high voltage unit <br> connection terminals (Y: T1-4; M: T1-3; C: T1-2; K: <br> T1-1). | Clean. <br> Replace the transfer belt unit. <br> (bizhub C368/C308/C258 / <br> bizhub C658/C558/C458) |  |
| 5 | 2nd transfer section | Dirt or foreign matter on the 2nd transfer roller. | Clean or correct the terminal. |  |

| Step | Section | Check item | Result | Action |
| :---: | :--- | :--- | :--- | :--- |
| 6 | 2nd transfer section | There is a positive contact between the application <br> terminals of the 2nd transfer and the connection <br> terminals (T2, E) and ground terminal of the high <br> voltage unit. | NO | Clean or correct the terminal. |
| 7 | Fusing unit | Dirt or foreign matter on paper path or separation claw <br> of the fusing unit. | YES | Clean. (Disassembling the fusing <br> unit is prohibited.) |
| 8 | Fusing unit | Scratches on belt and roller in fusing unit. | YES | Replace the fusing unit. (bizhub <br> C368/C308/C258 / bizhub C658/ <br> C558 / bizhub C458) |

(5) Scanner troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Original | Original is damaged or dirty. | YES | Change the original. |
| 2 | Original Type | Select [Copy setting] -> [Original Type] and change the setting, and the image trouble is eliminated. | YES | Correct the setting. |
| 3 | When original glass is being used: Service Mode -> Scan Area | Select [Service Mode] -> [Machine] -> [Scan Area] -> [Image Position: Leading Edge] and make the necessary adjustment, and the image trouble is eliminated. | NO | Go to the next step. |
| 4 | When original glass is being used | Original glass or original pad is dirty. | YES | Clean. |
|  |  |  | NO | Replace the CCD unit. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |
| 5 | When DF is being used: 2nd side: End face of original is reproduced as a line | Select [Service Mode] -> [ADF] -> [Auto Stop Position Adjustment] -> [Main Scanning (Front)] and the image trouble is eliminated. | NO | Go to the next step. |
| 6 | When DF is being used: 2nd side: End face of original is reproduced as a line | Select [Service Mode] -> [ADF] -> [Auto Stop Position Adjustment] -> [Main Scanning (Back)] and the image trouble is eliminated. | NO | Go to the next step. |
| 7 | - When DF is being used: 1st side <br> - When DF-629 is being used: 2nd side | Original reading glass or original reading glass cleaning brush is dirty. | YES | Clean. |
|  |  |  | NO | Replace the CCD unit. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |
| 8 | DF-704 or dual scan document feeder is being used: 2nd side | CIS glass or CIS cleaning brush is dirty. | YES | Clean. |
|  |  |  | NO | Replace the CIS module. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |

### 16.3.5 Uneven density 1

## (1) Typical faulty images

The arrow in the exemplary image troubles indicates the paper feeding direction.

(2) Initial troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :--- | :--- | :--- | :--- |
| 1 | Paper Setting | The paper to be used for printing does not match the <br> paper type and size of paper setting selected on the <br> machine. | YES | Make the paper setting again on <br> the machine. |
| 2 | IDC sensor | - IDC sensor is dirty. <br> - IDC sensor shutter does not operate properly. | YES | • Clean. <br> • <br> Clean or correct the IDC <br> sensor shutter. |

| Step | Section | Check item | Result | Action |
| :---: | :--- | :--- | :--- | :--- |
| 3 | Service Mode -> <br> Stabilizer | Select [Service Mode] -> [Imaging Process Adjustment] <br> $->$ [Stabilizer] -> [Stabilization Only] and the image <br> trouble is eliminated. | NO | Go to the next step. |
| 4 | Service Mode -> <br> Gradation Adjust | Select [Service Mode] -> [Imaging Process Adjustment] <br> $->$ [Gradation Adjust] and the image trouble is <br> eliminated. | NO | Go to the next step. |
| 5 | Image check | Select [Service Mode] -> [Test Mode] -> [Halftone <br> Pattern]. Select "SINGLE", "HYPER", "Gradation", <br> "1-Sided", "CMYK", and "Full Bleed", enter "64" for <br> Density, and load tray 2 with A3 paper. Press the <br> start key. This runs a print cycle for C, M, Y, and K <br> in that order. <br> Check the image after printing and the abnormal <br> image occurs only with one color. | NO | Go to the 1-color troubleshooting <br> procedure. |

(3) 1-color troubleshooting procedure

| Step | Section | Check item for the faulty color | Result | Action for the faulty color |
| :---: | :---: | :---: | :---: | :---: |
| 1 | High image density original | Uneven density in sub scan direction occurs at a pitch of 40 mm to 50 mm when a multi-copy cycle is run using an original with high image density ( $50 \%$ or more). | YES | Feed 10 to 20 blank sheets of paper with no originals placed, as the developing unit fails to keep up with a high demand for toner. |
| 2 | Service Mode -> LD 1/2 Balance Adj. | Select [Service Mode] -> [Machine] -> [LD adjustment] > [LD 1/2 Balance Adj.] and the image trouble is eliminated. | NO | Go to the next step. |
| 3 | Service Mode -> TCR Level Setting | Select [Service Mode] -> [Imaging Process Adjustment] - > [TCR Level Setting] and make the necessary adjustment, and the image trouble is eliminated. | NO | Go to the next step. |
| 4 | Write section | Dirt or foreign matter on the dust-proof glass of the PH. | YES | Clean the PH window. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |
| 5 | Charging section | Foreign matter on charging roller. | YES | Lightly wipe the surface clean of foreign matter using hydro-wipe (65AA-99\#\#). <br> Note: Do not apply a strong force to the surface of the charging roller, as doing so can damage the surface. |
| 6 | Photo conductor section | Dirt, scratches, or foreign matter on the photo conductor. | YES | - Clean. <br> - Replace the drum unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 7 | 1st transfer section | Dirt, scratches, or foreign matter on the 1st transfer roller. | YES | - Clean. <br> - Replace the transfer belt unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 8 | 1st transfer section | Faulty pressure/retraction operation of the 1st transfer roller. | YES | - Correct or replace the drive system. <br> - Replace the transfer belt unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 9 | Developing section | Toper hopper operates improperly or contains foreign matter. | YES | - Correct or remove. <br> - Replace the hopper drive unit. (bizhub C368/C308/ C258 / bizhub C658/C558 / bizhub C458) |
| 10 | Developing section | Toner bristles not even on the developing roller, resulting in a line or band. | YES | Replace the developing unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
|  |  |  | NO | - Replace the PH unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) <br> - Replace the high voltage unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) |

## (4) 4-color troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Paper path | There is dirty or foreign matter on paper path. | YES | Check and clean the paper path including the duplex section. |
| 2 | Transfer belt unit | Lines that can be removed by cleaning are evident on the transfer belt. (improper cleaning) | YES | - Check and clean the cleaning blade. <br> - Replace the transfer belt unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 3 | Transfer belt unit | Dirt, scratches, or foreign matter on the transfer belt. | YES | - Clean. <br> - Replace the transfer belt unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 4 | Transfer belt unit | There is a positive contact between the transfer belt application terminals and the high voltage unit connection terminals (Y: T1-4; M: T1-3; C: T1-2; K: T1-1). | NO | Clean or correct the terminal. |
| 5 | Transfer belt unit | Transfer belt rotates faultily. | YES | Replace the transfer belt unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 6 | 2ND TRANSFER SECTION | Dirt or foreign matter on the 2nd transfer roller. | YES | - Remove the foreign matter. <br> - Replace the transfer roller unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) |
| 7 | 2nd transfer section | Faulty pressure/retraction operation of the 2nd transfer roller. | YES | - Correct. <br> - Replace the transfer roller unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) |
| 8 | 2nd transfer section | There is a positive contact between the application terminals of the 2nd transfer and the connection terminals (T2, E) and ground terminal of the high voltage unit. | NO | Clean or correct the terminal. |
| 9 | Fusing unit | There is dirty or foreign matter on paper path of fusing unit. | YES | Clean. (Disassembling the fusing unit is prohibited.) |
| 10 | Service Mode -> Initialize <br> + Image Stabilization | Select [Service Mode] -> [Imaging Process Adjustment] -> [Stabilizer] -> [Initialize + Image Stabilization] and [Gradation Adjust], and the image trouble is eliminated. | YES | Readjust. |
|  |  |  | NO | - Replace the fusing unit. (bizhub C368/C308/C258 / bizhub C658/C558 / bizhub C458) |

- Replace the high voltage unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458)
- Replace the MFP board. (bizhub C368/C308/C258 / bizhub C658/C558/C458)

### 16.3.6 Uneven density 2

(1) Typical faulty images

The arrow in the exemplary image troubles indicates the paper feeding direction.

(2) Initial troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :--- | :--- | :--- | :--- |
| 1 | Paper Setting | The paper to be used for printing does not match the <br> paper type and size of paper setting selected on the <br> machine. | YES | Make the paper setting again on <br> the machine. |
| 2 | IDC sensor | - IDC sensor is dirty. <br> - IDC sensor shutter does not operate properly. | YES | • Clean. <br> - <br> Clean or correct the IDC <br> sensor shutter. |

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 3 | Service Mode -> Stabilizer | Select [Service Mode] -> [Imaging Process Adjustment] -> [Stabilizer] -> [Stabilization Only] and the image trouble is eliminated. | NO | Go to the next step. |
| 4 | Service Mode -> Gradation Adjust | Select [Service Mode] -> [Imaging Process Adjustment] -> [Gradation Adjust] and the image trouble is eliminated. | NO | Go to the next step. |
| 5 | Image check | - Select [Service Mode] -> [Test Mode] -> [Halftone Pattern]. Select "SINGLE", "HYPER", "Gradation", "1-Sided", "CMYK", and "Full Bleed", enter "64" for Density, and load tray 2 with A3 paper. Press the start key. This runs a print cycle for $\mathrm{C}, \mathrm{M}, \mathrm{Y}$, and K in that order. <br> - Check the image after printing and the abnormal image occurs only with one color. | YES | Go to the 1-color troubleshooting procedure. |
|  |  |  | NO | Go to the 4-color troubleshooting procedure. |

## (3) 1-color troubleshooting procedure

| Step | Section | Check item for the faulty color | Result | Action for the faulty color |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Service Mode -> LD 1/2 Balance Adj. | Select [Service Mode] -> [Machine] -> [LD adjustment] > [LD 1/2 Balance Adj.] and the image trouble is eliminated. | YES | Readjust. |
| 2 | Write section | Dirt or foreign matter on the dust-proof glass of the PH. | YES | Clean the PH window. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |
| 3 | Charging section | Foreign matter on charging roller. | YES | Lightly wipe the surface clean of foreign matter using hydro-wipe (65AA-99\#\#). <br> Note: Do not apply a strong force to the surface of the charging roller, as doing so can damage the surface. |
| 4 | Photo conductor section | Dirt, scratches, or foreign matter on the photo conductor. | YES | - Clean. <br> - Replace the drum unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 5 | Photo conductor section | Photo conductor drives faultily. | YES | - Correct. <br> - Replace the drum unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 6 | 1st transfer section | Scratches or dirt on 1st transfer roller. | YES | - Clean. <br> - Replace the transfer belt unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 7 | Developing section | Toner bristles not even on the developing roller, resulting in a line or band. | YES | Replace the developing unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
|  |  |  | NO | - Replace the PH unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) <br> - Replace the high voltage unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) |

(4) 4-color troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Paper path | There is dirty or foreign matter on paper path. | YES | Check and clean the paper path including the duplex section. |
| 2 | Transfer belt unit | Dirt, scratches, or foreign matter on the transfer belt. | YES | - Clean. <br> - Replace the transfer belt unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 3 | Transfer belt unit | There is a positive contact between the transfer belt application terminals and the high voltage unit connection terminals (Y: T1-4; M: T1-3; C: T1-2; K: T1-1). | NO | Clean or correct the terminal. |
| 4 | Transfer belt unit | Transfer belt rotates faultily. | YES | - Correct. <br> - Replace the transfer belt unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 5 | 2nd transfer section | Dirt or foreign matter on the 2nd transfer roller. | YES | - Remove the foreign matter. <br> - Replace the transfer roller unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) |
| 6 | 2nd transfer section | Faulty pressure/retraction operation of the 2nd transfer roller. | YES | - Correct. <br> - Replace the transfer roller unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) |
| 7 | 2nd transfer section | There is a positive contact between the application terminals of the 2nd transfer and the connection terminals (T2, E) and ground terminal of the high voltage unit. | NO | Clean or correct the terminal. |
| 8 | Fusing unit | There is dirty or foreign matter on paper path of fusing unit. | YES | Clean. (Disassembling the fusing unit is prohibited.) |
| 9 | Service Mode -> Initialize + Image Stabilization | Select [Service Mode] -> [Imaging Process Adjustment] -> [Stabilizer] -> [Initialize + Image Stabilization] and [Gradation Adjust], and the image trouble is eliminated. | YES | Readjust. |
|  |  |  | NO | - Replace the fusing unit. (bizhub C368/C308/C258 / bizhub C658/C558 / bizhub C458) <br> - Replace the high voltage unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) <br> - Replace the MFP board. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |

### 16.3.7 Faint image, low image density (ID lowering)

## (1) Typical faulty images

The arrow in the exemplary image troubles indicates the paper feeding direction.

(2) Initial troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Malfunction code | The maintenance call mark is displayed on the panel. | YES | Perform the relevant troubleshooting procedure corresponding to the malfunction code. |
| 2 | Paper Setting | The paper to be used for printing does not match the paper type and size of paper setting selected on the machine. | YES | Make the paper setting again on the machine. |
| 3 | Damp paper | Paper is damp. | YES | Change paper to one just unwrapped from its package. |
| 4 | IDC sensor | - IDC sensor is dirty. <br> - IDC sensor shutter does not operate properly. | YES | - Clean. <br> - Clean or correct the IDC sensor shutter. |
| 5 | Service Mode -> Stabilizer | Select [Service Mode] -> [Imaging Process Adjustment] -> [Stabilizer] -> [Stabilization Only] and the image trouble is eliminated. | NO | Go to the next step. |
| 6 | Service Mode -> Gradation Adjust | Select [Service Mode] -> [Imaging Process Adjustment] -> [Gradation Adjust] and the image trouble is eliminated. | NO | Go to the next step. |
| 7 | Image check | - Select [Service Mode] -> [Test Mode] -> [Gradation Pattern]. Select "SINGLE", "HYPER", "Gradation", "1-Sided", "4 Color", "Full Bleed", and "12 gradations", and load tray 2 with A3 paper. Press the start key. This runs a print cycle for C, M, Y, and K in that order. <br> - Check the image after printing to determine which color causes the abnormal image. | 1 to 3 colors | Go to the 1-color troubleshooting procedure. |
|  |  |  | $\begin{gathered} 4 \\ \text { colors } \end{gathered}$ | Go to the 4-color troubleshooting procedure. |
|  |  |  | Not availab le | Go to scanner troubleshooting procedure. |

(3) 1-color troubleshooting procedure

| Step | Section | Check item for the faulty color | Result | Action for the faulty color |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Write section | Dirt or foreign matter on the dust-proof glass of the PH. | YES | Clean the PH window. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |
| 2 | Charging section | Foreign matter on charging roller. | YES | Lightly wipe the surface clean of foreign matter using hydro-wipe (65AA-99\#\#). <br> Note: Do not apply a strong force to the surface of the charging roller, as doing so can damage the surface. |
| 3 | Service Mode -> Table Number | Select [Service Mode] -> [State Confirmation] -> [Table Number]. The measured value is close to the standard value. <br> - Developing bias: Vdc-C, Vdc-M, Vdc-Y, Vdc-K: close to the standard value of 300 V to $400 \mathrm{~V}(100$ V to 800 V ) <br> - Grid voltage: Vg-c, $\mathrm{Vg}-\mathrm{M}, \mathrm{Vg}-\mathrm{Y}, \mathrm{Vg}-\mathrm{K}$ : close to the standard value of 450 V to $550 \mathrm{~V}(200 \mathrm{~V}$ to 1000 V$)$ | NO | - Check the high voltage unit, developing unit, and the drum unit for wiring and connection. <br> - Replace the high voltage unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) |
| 4 | Photo conductor section | There is a positive contact between the electrostatic charger application terminals and the high voltage unit connection terminals. | NO | Clean or correct the terminal. |
| 5 | Developing section | There is a positive contact between the developing bias application terminals and the high voltage unit connection terminals (Y: B4; M: B3; C: B2; K: B1). | NO | Clean or correct the terminal. |
| 6 | Hopper drive unit section | Faulty connector connection between the toner supply motor (M6 to M9) and MFP board (CN16E, CN30E). | YES | Reconnect the connector. |
| 7 | Hopper drive unit section | Faulty in the drive of sub hopper. | YES | - Correct. <br> - Replace the hopper drive unit. (bizhub C368/C308/ C258 / bizhub C658/C558 / bizhub C458) |
| 8 | Service Mode -> TCR data | Select [Service Mode] -> [State Confirmation] -> [Level History 1] and the measured value is correct. TCR-C, TCR-M, TCR-Y, TCR-K: normal value 5 to $8 \%$ | NO | Select [Service Mode] -> [Imaging Process Adjustment] -> [Manual Toner Add] and perform the function. |
| 9 | Service Mode -> Max Image Density Adj | Select [Service Mode] -> [Imaging Process Adjustment] - > [Max Image Density Adj] and make the necessary adjustment, and the image trouble is eliminated. | NO | Go to the next step. |
| 10 | Service Mode -> Initialize <br> + Image Stabilization | Select [Service Mode] -> [Imaging Process Adjustment] -> [Stabilizer] -> [Initialize + Image Stabilization] and [Gradation Adjust], and the image trouble is eliminated. | YES | Readjust. |
|  |  |  | NO | - Replace the drum unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |

- Replace the developing unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
- Replace the PH unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
- Replace the high voltage unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458)
- Replace the MFP board. (bizhub C368/C308/C258 / bizhub C658/C558/C458)
(4) 4-color troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :--- | :--- | :--- | :--- |
| 1 | Transfer belt unit | There is a positive contact between the transfer belt <br> application terminals and the high voltage unit <br> connection terminals (Y: T1-4; M: T1-3; C: T1-2; K: <br> T1-1). | NO | Clean or correct the terminal. |
| 2 | 2nd transfer section | There is a positive contact between the application <br> terminals of the 2nd transfer and the connection <br> terminals (T2, E) and ground terminal of the high <br> voltage unit. | NO | Clean or correct the terminal. |
| 3 | Service Mode -> Max <br> Image Density Adj | Select [Service Mode] -> [Imaging Process Adjustment] <br> $->$ [Max Image Density Adj] and make the necessary <br> adjustment, and the image trouble is eliminated. | NO | Go to the next step. |

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 4 | Service Mode -> Initialize + Image Stabilization | Select [Service Mode] -> [Imaging Process Adjustment] -> [Stabilizer] -> [Initialize + Image Stabilization] and [Gradation Adjust], and the image trouble is eliminated. | YES | Readjust. |
|  |  |  | NO | - Replace the transfer belt unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) <br> - Replace the high voltage unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) <br> - Replace the MFP board. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |

## (5) Scanner troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :--- | :--- | :--- | :--- |
| 1 | Original Type | Select [Copy setting] -> [Original Type] and change the <br> setting, and the image trouble is eliminated. | YES | Correct the setting. |
| 2 | When original glass is <br> being used | Original glass or original pad is dirty. | YES | Clean. |
| 3 | Parts along scanning <br> path | Mirror, lens, light guide or reflectors is dirty. | YES | Clean. |
| 4 | Main body side_shading <br> sheet | Shading sheet of main body is dirty. | YES | Clean. |

### 16.3.8 Gradation reproduction failure

## (1) Typical faulty images

The arrow in the exemplary image troubles indicates the paper feeding direction

(2) Troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :--- | :--- | :--- | :--- |
| 1 | Malfunction code | The maintenance call mark is displayed on the panel. | YES | Perform the relevant <br> troubleshooting procedure <br> corresponding to the malfunction <br> code. |
| 2 | Paper Setting | The paper to be used for printing does not match the <br> paper type and size of paper setting selected on the <br> machine. | YES | Make the paper setting again on <br> the machine. |
| 3 | Image check | Select [Service Mode] -> [Test Mode] -> [Gradation <br> Pattern]. Select "SINGLE", "HYPER", "Gradation", <br> "1-Sided", "CMYK", "Full Bleed", and "12 <br> gradations", and load tray 2 with A3 paper. Press <br> the start key. This runs a print cycle for C, M, Y, <br> and K in that order. | - Go to the next step. |  |

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
|  |  | - Check the image after printing to determine which color causes the abnormal image. |  |  |
| 4 | Write section | Dirt or foreign matter on the dust-proof glass of the PH of the color which is responsible for the abnormal image. | YES | Clean the PH window. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |
| 5 | Charging section | Foreign matter on charging roller of the color which is responsible for the abnormal image. | YES | Lightly wipe the surface clean of foreign matter using hydro-wipe (65AA-99\#\#). <br> Note: Do not apply a strong force to the surface of the charging roller, as doing so can damage the surface. |
| 6 | IDC sensor | - IDC sensor is dirty. <br> - IDC sensor shutter does not operate properly. | YES | - Clean. <br> - Clean or correct the IDC sensor shutter. |
| 7 | Service Mode -> Stabilizer | Select [Service Mode] -> [Imaging Process Adjustment] -> [Stabilizer] -> [Stabilization Only] and the image trouble is eliminated. | NO | Go to the next step. |
| 8 | Service Mode -> Gradation Adjust | Select [Service Mode] -> [Imaging Process Adjustment] -> [Gradation Adjust] and the image trouble is eliminated. | NO | Go to the next step. |
| 9 | Service Mode -> Max Image Density Adj | Select [Service Mode] -> [Imaging Process Adjustment] - > [Max Image Density Adj] and make the necessary adjustment, and the image trouble is eliminated. | NO | Go to the next step. |
| 10 | Service Mode -> Initialize + Image Stabilization | Select [Service Mode] -> [Imaging Process Adjustment] -> [Stabilizer] -> [Initialize + Image Stabilization] and [Gradation Adjust], and the image trouble is eliminated. | YES | Readjust. |
|  |  |  | NO | - Replace the drum unit that is responsible for the abnormal image. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) <br> - Replace the developing unit that is responsible for the abnormal image. (bizhub C368/C308/C258 / bizhub C658/C558/C458) <br> - Replace the PH unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) <br> - Replace the high voltage unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) <br> - Replace the MFP board. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |

### 16.3.9 Color reproducibility error

## (1) Typical faulty images

The arrow in the exemplary image troubles indicates the paper feeding direction.

(2) Troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :--- | :--- | :--- | :--- |
| 1 | Damp paper | Paper is damp. | YES | Change paper to one just <br> unwrapped from its package. |
| 2 | Paper Setting | The paper to be used for printing does not match the <br> paper type and size of paper setting selected on the <br> machine. | YES | Make the paper setting again on <br> the machine. |
| 3 | Administrator Settings -> <br> PS Designer Settings | Select [Utility] -> [Administrator Settings] -> [System <br> Settings] -> [Expert Adjustment] -> [PS Designer <br> Settings] and change the setting, and the image trouble <br> is eliminated. | NO | Go to the next step. |

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 4 | Image check | - Select [Service Mode] -> [Test Mode] -> [8 Color Solid Pattern]. Select "SINGLE", "HYPER", "Gradation", and "1-Sided", enter "64" for Density, and load tray 2 with A3 paper. Press the start key. This runs a print cycle of 8 colors on one sheet of paper. <br> - Check the image after printing and the abnormal image is evident. | YES | Go to the next step. |
| 5 | Write section | Dirt or foreign matter on the dust-proof glass of the PH. | YES | Clean the PH window. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |
| 6 | Charging section | Foreign matter on charging roller. | YES | Lightly wipe the surface clean of foreign matter using hydro-wipe (65AA-99\#\#). <br> Note: Do not apply a strong force to the surface of the charging roller, as doing so can damage the surface. |
| 7 | Transfer belt unit | There is a positive contact between the transfer belt application terminals and the high voltage unit connection terminals (Y: T1-4; M: T1-3; C: T1-2; K: T1-1). | NO | Clean or correct the terminal. |
| 8 | 2nd transfer section | There is a positive contact between the application terminals of the 2nd transfer and the connection terminals (T2, E) and ground terminal of the high voltage unit. | NO | Clean or correct the terminal. |
| 9 | IDC sensor | - IDC sensor is dirty. <br> - IDC sensor shutter does not operate properly. | YES | - Clean. <br> - Clean or correct the IDC sensor shutter. |
| 10 | Service Mode -> Stabilizer | Select [Service Mode] -> [Imaging Process Adjustment] -> [Stabilizer] -> [Stabilization Only] and the image trouble is eliminated. | NO | Go to the next step. |
| 11 | Service Mode -> Gradation Adjust | Select [Service Mode] -> [Imaging Process Adjustment] -> [Gradation Adjust] and the image trouble is eliminated. | NO | Go to the next step. |
| 12 | Service Mode -> Max Image Density Adj | Select [Service Mode] -> [Imaging Process Adjustment] - > [Max Image Density Adj] and make the necessary adjustment, and the image trouble is eliminated. | NO | Go to the next step. |
| 13 | Connector connection | Faulty connector connection the high voltage unit (CN1, CN2) and MFP board (CN22E, CN36E). | YES | Reconnect the connector. |
| 14 | Service Mode -> Initialize <br> + Image Stabilization | Select [Service Mode] -> [Imaging Process Adjustment] -> [Stabilizer] -> [Initialize + Image Stabilization] and [Gradation Adjust], and the image trouble is eliminated. | YES | Readjust. |
|  |  |  | NO | - Replace the transfer belt unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) <br> - Replace the high voltage unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) <br> - Replace the MFP board. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |

### 16.3.10 Incorrect color image registration

## (1) Typical faulty images

The arrow in the exemplary image troubles indicates the paper feeding direction.

## (2) Initial troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Malfunction code | The maintenance call mark is displayed on the panel. | YES | Perform the relevant troubleshooting procedure corresponding to the malfunction code. |
| 2 | Paper Setting | The paper to be used for printing does not match the paper type and size of paper setting selected on the machine. | YES | Make the paper setting again on the machine. |
| 3 | Service Mode -> Stabilizer | Select [Service Mode] -> [Imaging Process Adjustment] -> [Stabilizer] -> [Stabilization Only] and the image trouble is eliminated. | NO | Go to the next step. |
| 4 | Service Mode -> Gradation Adjust | Select [Service Mode] -> [Imaging Process Adjustment] -> [Gradation Adjust] and the image trouble is eliminated. | NO | Go to the next step. |
| 5 | Image check | - Select [Service Mode] -> [Test Mode] -> [8 Color Solid Pattern]. Select "SINGLE", "HYPER", "Gradation", and "1-Sided", enter "64" for Density, and load tray 2 with A3 paper. Press the start key. This runs a print cycle of 8 colors on one sheet of paper. <br> - Check the image after printing and the abnormal image is evident. | YES | Go to engine troubleshooting procedure. |
|  |  |  | NO | Go to scanner troubleshooting procedure. |

## (3) Engine troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :--- | :--- | :--- | :--- |
| 1 | Incorrect color <br> registration evident at the <br> trailing edge of the <br> printed image | Select [Service Mode] -> [Machine] -> [Trail Edge Color <br> Alignment Adj] and the image trouble is eliminated. | NO | Go to the next step. |
| 2 | Connector connection | Faulty connector connection the MFP board (CN18) <br> and PH relay board (CN1, CN2). | YES | Reconnect the connector. |
| 3 | Service Mode -> Color <br> Registration Adjustment | Select [Service Mode] -> [Machine] -> [Color <br> Registration Adjustment] and the image trouble is <br> eliminated. | NO | Go to the next step. |
| 4 | Service Mode -> Print <br> Head Skew Reset | Select [Service Mode] -> [Machine] -> [Print Hear Skew <br> Adj.] -> [Print Head Skew Reset] and the image trouble <br> is eliminated. | NO | Go to the next step. |
| 5 | Service Mode -> Initialize <br> + Image Stabilization | Select [Service Mode] -> [Imaging Process Adjustment] <br> -> [Stabilizer] -> [Initialize + Image Stabilization] and <br> [Gradation Adjust], and the image trouble is eliminated. | YES | NO |

(4) Scanner troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Original | Original contains incorrect color registration. | YES | Change the original. |
| 2 | Original Type | Select [Copy setting] -> [Original Type] and change the setting, and the image trouble is eliminated. | NO | Go to the next step. |
| 3 | When DF is being used | DF does not lie flat. | YES | - Adjust the DF height. (DF-704 / DF-629 / Dual scan document feeder) <br> - Replace DF if it is deformed or hinges are broken. |
| 4 | Scanner rails | Foreign matter on scanner rails. | YES | Clean and apply lubricant. * |
| 5 | When original glass is being used | Scanner moves smoothly. | YES | Replace the CCD unit. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |
|  |  |  | NO | - Adjust the scanner motor drive belt. (bizhub C368/ C308/C258 / bizhub C658/ C558/C458) <br> - Replace the scanner motor. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | - Replace the scanner drive board. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) |
| 6 | When DF is being used: Registration Loop Adj. | Select [Service Mode] -> [ADF] -> [Registration Loop Adj.] and make the necessary adjustment, and the image trouble is eliminated. | YES | Readjust. |
|  |  |  | NO | Replace the CCD unit. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |
| 7 | When DF-704 or dual scan document feeder is being used: Paper path | There is dirty on paper path or roller of DF-704 or dual scan document feeder. | YES | Clean. |
|  |  |  | NO | Replace the CIS module. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |

*: Apply FLOIL No. 947P or Launa 40 oil to the scanner rails. FLOIL is a product manufactured by KANTO KASEI LTD. (http://www.kantokasei.co.jp/).

### 16.3.11 Foggy background

## (1) Typical faulty images

The arrow in the exemplary image troubles indicates the paper feeding direction.

(2) Initial troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Malfunction code | The maintenance call mark is displayed on the panel. | YES | Perform the relevant troubleshooting procedure corresponding to the malfunction code. |
| 2 | Paper Setting | The paper to be used for printing does not match the paper type and size of paper setting selected on the machine. | YES | Make the paper setting again on the machine. |
| 3 | Damp paper | Paper is damp. | YES | Change paper to one just unwrapped from its package. |
| 4 | IDC sensor | - IDC sensor is dirty. <br> - IDC sensor shutter does not operate properly. | YES | - Clean. <br> - Clean or correct the IDC sensor shutter. |
| 5 | Service Mode -> Stabilizer | Select [Service Mode] -> [Imaging Process Adjustment] -> [Stabilizer] -> [Stabilization Only] and the image trouble is eliminated. | NO | Go to the next step. |
| 6 | Service Mode -> Gradation Adjust | Select [Service Mode] -> [Imaging Process Adjustment] -> [Gradation Adjust] and the image trouble is eliminated. | NO | Go to the next step. |
| 7 | Service Mode -> Charge AC Output fine adjustment | Fog occurs unevenly on the left-hand side with respect to the paper feeding direction. Or fog occurs in part of the paper. <br> The fog is reduced when [Service Mode] -> [lmaging Process Adjustment] -> [Charge AC Output fine adjustment] are selected and the setting value is increased. | NO | Return the setting value to the original one and go to the next step. |
| 8 | Service Mode -> Image Background Adj | Select [Service Mode] -> [Imaging Process Adjustment] -> [Image Background Adj] and [Stabilizer] and the image trouble is eliminated. | NO | Set the fog margin value back to the original one and go to the next step. |
| 9 | Image check | - Select [Service Mode] -> [Test Mode] -> [Lattice Pattern]. Select "SINGLE", "HYPER", "Gradation", "1-Sided", "CMYK", "600dpi", and "Normal", enter "20" for CD width, "20" for FD width, and "64" for Density, and load tray 2 with A3 paper. Press the start key. This runs a print cycle for $\mathrm{C}, \mathrm{M}, \mathrm{Y}$, and K in that order. <br> - Check the image after printing to determine which color causes the abnormal image. | 1 to 3 colors | Go to the 1-color troubleshooting procedure. |
|  |  |  | $\begin{gathered} 4 \\ \text { colors } \end{gathered}$ | Go to the 4-color troubleshooting procedure. |
|  |  |  | Not availab le | Go to scanner troubleshooting procedure. |

## (3) 1-color troubleshooting procedure

| Step | Section | Check item for the faulty color | Result | Action for the faulty color |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Write section | Dirt or foreign matter on the dust-proof glass of the PH. | YES | Clean the PH window. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |
| 2 | Charging section | Foreign matter on charging roller. | YES | Lightly wipe the surface clean of foreign matter using hydro-wipe (65AA-99\#\#). <br> Note: Do not apply a strong force to the surface of the charging roller, as doing so can damage the surface. |
| 3 | Photo conductor section | There is a positive contact between the electrostatic charger application terminals and the high voltage unit connection terminals. | NO | Clean or correct the terminal. |
| 4 | Developing section | There is a positive contact between the developing bias application terminals and the high voltage unit connection terminals (Y: B4; M: B3; C: B2; K: B1). | NO | Clean or correct the terminal. |
| 5 | Service Mode -> TCR data | Select [Service Mode] -> [State Confirmation] -> [Level History 1] and the measured value is correct. TCR-C, TCR-M, TCR-Y, TCR-K: normal value 5 to $8 \%$ | NO | Select [Service Mode] -> [Imaging Process Adjustment] -> [Manual Toner Add] and perform the function. |
| 6 | Service Mode -> Max Image Density Adj | Select [Service Mode] -> [Imaging Process Adjustment] - > [Max Image Density Adj] and make the necessary adjustment, and the image trouble is eliminated. | NO | Go to the next step. |
| 7 | Connector connection | bizhub C368/C308/C258: <br> Faulty connector connection the high voltage unit (CN1, CN2), MFP board (CN18, CN22E, CN36E) and PH relay board (CN1, CN2). <br> bizhub C658/C558/C458: <br> Faulty connector connection the high voltage unit (CN1, CN2), MFP board (CN6, CN30E, CN33E) and PH relay board (CN1, CN2). | YES | Reconnect the connector. |
| 8 | Service Mode -> Initialize <br> + Image Stabilization | Select [Service Mode] -> [Imaging Process Adjustment] <br> -> [Stabilizer] -> [Initialize + Image Stabilization] and <br> [Gradation Adjust], and the image trouble is eliminated. | YES | Readjust. |
|  |  |  | NO | - Replace the drum unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) <br> - Replace the PH unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) <br> - Replace the high voltage unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) |

(4) 4-color troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Transfer belt unit | There is a positive contact between the transfer belt application terminals and the high voltage unit connection terminals (Y: T1-4; M: T1-3; C: T1-2; K: T1-1). | NO | Clean or correct the terminal. |
| 2 | 2nd transfer section | There is a positive contact between the application terminals of the 2nd transfer and the connection terminals (T2, E) and ground terminal of the high voltage unit. | NO | Clean or correct the terminal. |
| 3 | Service Mode -> Max Image Density Adj | Select [Service Mode] -> [Imaging Process Adjustment] - > [Max Image Density Adj] and make the necessary adjustment, and the image trouble is eliminated. | NO | Go to the next step. |
| 4 | Service Mode -> Initialize <br> + Image Stabilization | Select [Service Mode] -> [Imaging Process Adjustment] -> [Stabilizer] -> [Initialize + Image Stabilization] and [Gradation Adjust], and the image trouble is eliminated. | YES | Readjust. |
|  |  |  | NO | - Replace the transfer belt unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) <br> - Replace the high voltage unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) <br> - Replace the MFP board. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |

## (5) Scanner troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Original | Original is damaged or dirty. | YES | Change the original. |
| 2 | Original Type | Select [Copy setting] -> [Original Type] and change the setting, and the image trouble is eliminated. | NO | Go to the next step. |
| 3 | Basic -> Density | Change the density setting, and the image trouble is eliminated. | NO | Go to the next step. |
| 4 | When DF is being used | DF does not lie flat. | YES | - Adjust the DF height. (DF-704 / DF-629 / Dual scan document feeder) <br> - Replace DF if it is deformed or hinges are broken. |
| 5 | When original glass is being used | Original glass or original pad is dirty. | YES | Clean. |
| 6 | Parts along scanning path | Mirror, lens, light guide or reflectors is dirty. | YES | Clean. |
| 7 | Main body side_shading sheet | Shading sheet of main body is dirty. | YES | Clean. |
| 8 | - When DF is being used: 1st side <br> - When DF-629 is being used: 2nd side | Original reading glass or original reading glass cleaning brush is dirty. | YES | Clean. |
|  |  |  | NO | - Replace the LED exposure unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) <br> - Replace the CCD unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 9 | DF-704 or dual scan document feeder is being used: 2nd side | - Shading correction surface of DF-704 or dual scan document feeder is dirty. <br> - CIS glass or CIS cleaning brush is dirty. | YES | Clean. |
|  |  |  | NO | Replace the CIS module. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |

### 16.3.12 Void areas, White spots

## (1) Typical faulty images

The arrow in the exemplary image troubles indicates the paper feeding direction.

[1] Void areas $\quad$ [2] White spots
(2) Initial troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :--- | :--- | :--- | :--- |
| 1 | Paper Setting | The paper to be used for printing does not match the <br> paper type and size of paper setting selected on the <br> machine. | YES | Make the paper setting again on <br> the machine. |
| 2 | Use in areas with low <br> atmospheric pressure | Select [Service Mode] -> [Imaging Process Adjustment] <br> $->$ [Grad/Dev AC Bias V Selection] and change the <br> setting to [ON]. This eliminates the trouble. | NO | Change the setting to [OFF] and <br> go to the next step. |
| 3 | IDC sensor | - IDC sensor is dirty. <br> - IDC sensor shutter does not operate properly. | YES | - Clean. <br> Clean or correct the IDC <br> sensor shutter. |
| 4 | Service Mode -> <br> Stabilizer | Select [Service Mode] -> [Imaging Process Adjustment] <br> -> [Stabilizer] -> [Stabilization Only] and the image <br> trouble is eliminated. | NO | Go to the next step. |
| 5 | Service Mode -> <br> Gradation Adjust | Select [Service Mode] -> [Imaging Process Adjustment] <br> -> [Gradation Adjust] and the image trouble is <br> eliminated. | NO | Go to the next step. |
| 6 | Service Mode -> Charge <br> AC Output fine <br> adjustment | The white spots is eliminated when [Service Mode] -> <br> [Imaging Process Adjustment] -> [Charge AC Output | NO | Return the setting value to the <br> fine adjustment] are selected and the setting value is <br> incer <br> step. |

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 7 | Service Mode -> Primary transfer adj. | Select [Service Mode] -> [Imaging Process Adjustment] -> [Transfer Voltage Fine Adj] -> [Primary transfer adj.] and the image trouble is eliminated. <br> * Decrease the setting value for white dots. | NO | Return the setting value to the original one and go to the next step. |
| 8 | Service Mode -> 2nd transfer adj. | Select [Service Mode] -> [Imaging Process Adjustment] -> [Transfer Voltage Fine Adj] -> [2nd Transfer Adj.] and the image trouble is eliminated. <br> * Increase or decrease the setting value to find a specific value at which the trouble is eliminated. | NO | Return the setting value to the original one and go to the next step. |
| 9 | Enhanced Security -> Engine FW Dip SW | Select [Service Mode] -> [Enhanced Security] -> [Engine FW Dip SW] -> [No. 8], set OFF, perform [2nd Transfer Adj.] again, and the image trouble is eliminated. <br> * Increase or decrease the setting value to find a specific value at which the trouble is eliminated. | NO | Return the setting value to the original one and go to the next step. |
| 10 | Service Mode -> TCR Level | Select [Service Mode] -> [Imaging Process Adjustment] -> [TCR level] and set the adjustment value of all colors to "+3". <br> Next, select [Service Mode] -> [Imaging Process Adjustment] -> [Manual Toner Add], select all colors, and press the start key. (This starts a toner replenishing sequence.) <br> Then, select [Service Mode] -> [Imaging Process <br> Adjustment] -> [Stabilizer] -> [Initialize + Image <br> Stabilization] and perform the function. <br> Then, select [Service Mode] -> [Imaging Process <br> Adjustment] -> [Transfer Voltage Fine Adj.] -> [2nd Transfer Adj.], perform the function, and the image trouble is eliminated. <br> * Increase or decrease the setting value to find a specific value at which the trouble is eliminated. | NO | Return the setting value to the original one and go to the next step. |
| 11 | Image check | - Select [Service Mode] -> [Test Mode] -> [Halftone Pattern]. Select "SINGLE", "HYPER", "Gradation", "1-Sided", "CMYK", and "Full Bleed", enter "64" for Density, and load tray 2 with A3 paper. Press the start key. This runs a print cycle for C, M, Y, and K in that order. <br> - If the abnormal image does not recur, change Density to " 255 " and make a print check. <br> - Check the image after printing and the abnormal image occurs only with one color. | YES | Go to the 1-color troubleshooting procedure. |
|  |  |  | NO | Go to the 4-color troubleshooting procedure. |

(3) 1-color troubleshooting procedure

| Step | Section | Check item for the faulty color | Result | Action for the faulty color |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Write section | Dirt or foreign matter on the dust-proof glass of the PH. | YES | Clean the PH window. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |
| 2 | Charging section | Foreign matter on charging roller. | YES | Lightly wipe the surface clean of foreign matter using hydro-wipe (65AA-99\#\#). <br> Note: Do not apply a strong force to the surface of the charging roller, as doing so can damage the surface. |
| 3 | Photo conductor section | Dirt, scratches, or foreign matter on the photo conductor. | YES | - Clean. <br> - Replace the drum unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 4 | Photo conductor section | There is a positive contact between the electrostatic charger application terminals and the high voltage unit connection terminals. | NO | Clean or correct the terminal. |
| 5 | Developing section | Toner bristles not even on the developing roller, resulting in a void area. | YES | Replace the developing unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 6 | 1st transfer section | There is a positive contact between the transfer belt application terminals and the high voltage unit connection terminals (Y: T1-4; M: T1-3; C: T1-2; K: T1-1). | NO | Clean or correct the terminal. |
| 7 | Connector connection | bizhub C368/C308/C258: | YES | Reconnect the connector. |

## (4) 4-color troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Transfer belt unit | Dirt, scratches, or foreign matter on the transfer belt. | YES | - Clean. <br> - Replace the transfer belt unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 2 | 2nd transfer section | Dirt or foreign matter on the 2nd transfer roller. | YES | - Remove the foreign matter. <br> - Replace the transfer roller unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) |
| 3 | Paper path | There is dirty or foreign matter on paper path. | YES | Check and clean the paper path including the duplex section. |
| 4 | Connector connection | bizhub C368/C308/C258: <br> Faulty connector connection the high voltage unit (CN1, CN2) and MFP board (CN22E, CN36E). <br> bizhub C658/C558/C458: <br> Faulty connector connection the high voltage unit (CN1, CN2) and MFP board (CN30E, CN33E). | YES | Reconnect the connector. |
| 5 | Service Mode -> Initialize + Image Stabilization | Select [Service Mode] -> [Imaging Process Adjustment] -> [Stabilizer] -> [Initialize + Image Stabilization] and [Gradation Adjust], and the image trouble is eliminated. | YES | Readjust. |
|  |  |  | NO | Replace the high voltage unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |

### 16.3.13 Color spot

## (1) Typical faulty images

The arrow in the exemplary image troubles indicates the paper feeding direction.

(2) Initial troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :--- | :--- | :--- | :--- |
| 1 | Paper Setting | The paper to be used for printing does not match the <br> paper type and size of paper setting selected on the <br> machine. | YES | Make the paper setting again on <br> the machine. |
| 2 | IDC sensor | - IDC sensor is dirty. <br> - IDC sensor shutter does not operate properly. | YES <br> • Clean. <br> Clean or correct the IDC <br> sensor shutter. |  |
| 3 | Service Mode -> <br> Stabilizer | Select [Service Mode] -> [Imaging Process Adjustment] <br> -> [Stabilizer] -> [Stabilization Only] and the image <br> trouble is eliminated. | NO | Go to the next step. |

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 4 | Service Mode -> Gradation Adjust | Select [Service Mode] -> [Imaging Process Adjustment] -> [Gradation Adjust] and the image trouble is eliminated. | NO | Go to the next step. |
| 5 | Service Mode -> Charge AC Output fine adjustment | Fine colored dots evident on the left-hand side with respect to the paper feeding direction. Or fine color spots are evident on a particular portion in the paper. The color spots are reduced when [Service Mode] -> [Imaging Process Adjustment] -> [Charge AC Output fine adjustment] are selected and the setting value is increased. | NO | Return the setting value to the original one and go to the next step. |
| 6 | Service Mode -> Primary transfer adj. | Select [Service Mode] -> [Imaging Process Adjustment] -> [Transfer Voltage Fine Adj] and the image trouble is eliminated. <br> * Decrease the setting value for color spots. | NO | Return the setting value to the original one and go to the next step. |
| 7 | Image check | - Select [Service Mode] -> [Test Mode] -> [Solid Pattern]. Select "SINGLE", "HYPER", "Gradation", and "1-Sided", enter "64" for Density, and load tray 2 with A3 paper. Press the start key. This runs a print cycle of 4 colors on one sheet of paper. <br> - Check the image after printing to determine which color causes the abnormal image. | 1 to 3 colors | Go to the 1-color troubleshooting procedure. |
|  |  |  | $\begin{array}{\|c\|} \hline 4 \\ \text { colors } \end{array}$ | Go to the 4-color troubleshooting procedure. |
|  |  |  | Not availab le | Go to scanner troubleshooting procedure. |

(3) 1-color troubleshooting procedure

| Step | Section | Check item for the faulty color | Result | Action for the faulty color |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Write section | Dirt or foreign matter on the dust-proof glass of the PH. | YES | Clean the PH window. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |
| 2 | Charging section | Foreign matter on charging roller. | YES | Lightly wipe the surface clean of foreign matter using hydro-wipe (65AA-99\#\#). <br> Note: Do not apply a strong force to the surface of the charging roller, as doing so can damage the surface. |
| 3 | Photo conductor section | Dirt, scratches, or foreign matter on the photo conductor. | YES | - Clean. <br> - Replace the drum unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 4 | Photo conductor section | There is a positive contact between the electrostatic charger application terminals and the high voltage unit connection terminals. | NO | Clean or correct the terminal. |
| 5 | Developing section | There is a positive contact between the developing bias application terminals and the high voltage unit connection terminals (Y: B4; M: B3; C: B2; K: B1). | NO | Clean or correct the terminal. |
| 6 | Connector connection | bizhub C368/C308/C258: <br> Faulty connector connection the high voltage unit (CN1, CN2), MFP board (CN18, CN22E, CN36E) and PH relay board (CN1, CN2). <br> bizhub C658/C558/C458: <br> Faulty connector connection the high voltage unit (CN1, CN2), MFP board (CN6, CN30E, CN33E) and PH relay board (CN1, CN2). | YES | Reconnect the connector. |
| 7 | Service Mode -> Initialize + Image Stabilization | Select [Service Mode] -> [Imaging Process Adjustment] -> [Stabilizer] -> [Initialize + Image Stabilization] and [Gradation Adjust], and the image trouble is eliminated. | YES | Readjust. |
|  |  |  | NO | - Replace the drum unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) <br> - Replace the PH unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) <br> - Replace the high voltage unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) |

(4) 4-color troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :--- | :--- | :---: | :---: |
| 1 | Transfer belt unit | Dirt, scratches, or foreign matter on the transfer belt. | YES | • Clean. |

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | - Replace the transfer belt unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 2 | 2nd transfer section | Dirt or foreign matter on the 2nd transfer roller. | YES | - Remove the foreign matter. <br> - Replace the transfer roller unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) |
| 3 | Paper path | There is dirty or foreign matter on paper path. | YES | Check or clean the paper path including the duplex section. |
| 4 | Connector connection | Faulty connector connection the high voltage unit (CN1, CN2) and MFP board (CN22E, CN36E). | YES | Reconnect the connector. |
| 5 | Service Mode -> Initialize + Image Stabilization | Select [Service Mode] -> [Imaging Process Adjustment] -> [Stabilizer] -> [Initialize + Image Stabilization] and [Gradation Adjust], and the image trouble is eliminated. | YES | Readjust. |
|  |  |  | NO | Replace the high voltage unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |

(5) Scanner troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Original | Original is damaged or dirty. | YES | Change the original. |
| 2 | Original Type | Select [Copy setting] -> [Original Type] and change the setting, and the image trouble is eliminated. | YES | Correct the setting. |
| 3 | When original glass is being used | Original glass or original pad is dirty. | YES | Clean. |
|  |  |  | NO | Replace the CCD unit. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |
| 4 | - When DF is being used: 1st side <br> - When DF-629 is being used: 2nd side | Original reading glass or original reading glass cleaning brush is dirty. | YES | Clean. |
|  |  |  | NO | - Replace the LED exposure unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) <br> - Replace the CCD unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 5 | DF-704 or dual scan document feeder is being used: 2nd side | CIS glass or CIS cleaning brush is dirty. | YES | Clean. |
|  |  |  | NO | Replace the CIS module. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |

### 16.3.14 Blurred image

## (1) Typical faulty images

The arrow in the exemplary image troubles indicates the paper feeding direction.

(2) Initial troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :--- | :--- | :--- | :--- |
| 1 | Damp paper | Paper is damp. | YES | Change paper to one just <br> unwrapped from its package. |
| 2 | Paper Setting | The paper to be used for printing does not match the <br> paper type and size of paper setting selected on the <br> machine. | YES | Make the paper setting again on <br> the machine. |
| 3 | Service Mode -> <br> Stabilizer | Select [Service Mode] -> [Imaging Process Adjustment] <br> -> [Stabilizer] -> [Stabilization Only] and the image <br> trouble is eliminated. | NO | Go to the next step. |
| 4 | Service Mode -> <br> Gradation Adjust | Select [Service Mode] -> [Imaging Process Adjustment] <br> -> [Gradation Adjust] and the image trouble is <br> eliminated. | NO | Go to the next step. |

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 5 | Image check | - Select [Service Mode] -> [Test Mode] -> [Lattice Pattern]. Select "SINGLE", "HYPER", "Gradation", "1-Sided", "CMYK", "600dpi", and "Normal", enter "10" for CD width, "10" for FD width, and "64" for Density, and load tray 2 with A3 paper. Press the start key. This runs a print cycle for $\mathrm{C}, \mathrm{M}, \mathrm{Y}$, and K in that order. <br> - Check the image after printing and the abnormal image is evident. | YES | Go to engine troubleshooting procedure. |
|  |  |  | NO | Go to scanner troubleshooting procedure. |

(3) Engine troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Write section | Dirt or foreign matter on the dust-proof glass of the PH of the color which is responsible for the abnormal image. | YES | Clean the PH window. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |
| 2 | Charging section | Foreign matter on charging roller of the color which is responsible for the abnormal image. | YES | Lightly wipe the surface clean of foreign matter using hydro-wipe (65AA-99\#\#). <br> Note: Do not apply a strong force to the surface of the charging roller, as doing so can damage the surface. |
| 3 | Photo conductor section | Dirt or foreign matter on the photo conductor of the PH of the color which is responsible for the abnormal image. | YES | - Clean. <br> - Replace the drum unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
|  |  |  | NO | Replace the PH unit. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |

## (4) Scanner troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Original | Original is folded, bent, or raised. | YES | Change the original. |
| 2 | Original Type | Select [Copy setting] -> [Original Type] and change the setting, and the image trouble is eliminated. | YES | Correct the setting. |
| 3 | When original glass is being used | Original glass tilts. | YES | Corrected to the correct position. |
| 4 | Parts along scanning path | Mirror, lens, light guide or reflectors is dirty. | YES | Clean. |
| 5 | When DF is being used | DF does not lie flat. | YES | - Adjust the DF height. (DF-704 / DF-629 / Dual scan document feeder) <br> - Replace DF if it is deformed or hinges are broken. |
| 6 | - When DF is being used: 1st side <br> - When DF-629 is being used: 2nd side | Document reading glass tilts. | YES | Corrected to the correct position. |
|  |  |  | NO | - Replace the LED exposure unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) <br> - Replace the CCD unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 7 | DF-704 or dual scan document feeder is being used: 2nd side | CIS glass or CIS cleaning brush is tilted. | YES | Corrected to the correct position. |
|  |  |  | NO | Replace the CIS module. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |

### 16.3.15 Back marking

## (1) Typical faulty images

The arrow in the exemplary image troubles indicates the paper feeding direction.

## (2) Troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :--- | :--- | :--- | :--- |
| 1 | Paper Setting | The paper to be used for printing does not match the <br> paper type and size of paper setting selected on the <br> machine. | YES | Make the paper setting again on <br> the machine. |
| 2 | Paper path | There is dirty or foreign matter on paper path. | YES | Check and clean the paper path <br> including the duplex section. |
| 3 | 2nd transfer section | Dirt or foreign matter on the 2nd transfer roller. | YES <br> • <br> Remove the foreign matter. <br> Replace the transfer roller <br> unit. (bizhub C368/C308/ <br> C258 / bizhub C658/C558/ <br> C458) |  |
| 4 | Fusing unit | There is dirty or foreign matter on paper path of fusing <br> unit. | YES | Clean. (Disassembling the fusing <br> unit is prohibited.) |
| 5 | Fusing unit | Scratches on belt and roller in fusing unit. | YES | Replace the fusing unit. (bizhub <br> C368/C308/C258/bizhub C658/ <br> C558 / bizhub C458) |

### 16.3.16 Blank copy, Black copy

## (1) Typical faulty images

The arrow in the exemplary image troubles indicates the paper feeding direction.

(3) Engine troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :--- | :--- | :--- | :--- |
| 1 | 2nd transfer section | There is a positive contact between the application <br> terminals of the 2nd transfer and the connection <br> terminals (T2, E) and ground terminal of the high <br> voltage unit. | NO | Clean or correct the terminal. |
| 2 | Transfer belt unit | With the color of toner responsible for the abnormal <br> image, there is a positive contact between the transfer <br> belt application terminals and the high voltage unit <br> connection terminals (Y: T1-4; M: T1-3; C: T1-2; K: <br> T1-1). | NO | Clean or correct the terminal. |
| 3 | Photo conductor section | The drum unit of the color of toner responsible for the <br> abnormal image is installed properly. | NO | Reinstall. |
| 4 | Photo conductor section | With the color of toner responsible for the abnormal <br> image, there is a positive contact between the drum <br> charge corona bias application terminals and the high <br> voltage unit connection terminals. | NO | Clean or correct the terminal. |

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 5 | Developing section | With the color of toner responsible for the abnormal image, there is a positive contact between the developing bias application terminals and the high voltage unit connection terminals (Y: B4; M: B3; C: B2; K: B1). | NO | Clean or correct the terminal. |
| 6 | Connector connection | bizhub C368/C308/C258: <br> Faulty connector connection the high voltage unit (CN1, CN2) and MFP board (CN22E, CN36E). <br> bizhub C658/C558/C458: <br> Faulty connector connection the high voltage unit (CN1, CN2) and MFP board (CN30E, CN33E). | YES | Reconnect the connector. |
| 7 | Write section | bizhub C368/C308/C258: <br> Faulty connector connection the MFP board (CN18) and PH relay board (CN1, CN2). <br> bizhub C658/C558/C458: <br> Faulty connector connection the MFP board (CN6) and PH relay board (CN1, CN2). | YES | Reconnect the connector. |
| 8 | Service Mode -> Selfdiagnostic | Select [Service Mode] -> [State Confirmation] -> [Selfdiagnostic] -> [Check All] and perform the function. Then, "NG" appears. | YES | Take relevant action corresponding to the check item in which "NG" has appeared. |
|  |  |  | NO | - Replace the high voltage unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) <br> - Replace the MFP board. (bizhub C368/C308/C258 / bizhub C658/C558/C458) <br> - Replace the PH unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |

(4) Scanner troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Black copy: Scanner section | Foreign matter on scanner rails. Faulty the drive shaft and pulley shaft. | YES | Clean and apply lubricant. *1 *2 |
| 2 |  | Scanner moves smoothly. | NO | - Adjust the scanner motor drive belt. (bizhub C368/ C308/C258 / bizhub C658/ C558/C458) <br> - Replace the scanner motor. (bizhub C368/C308/C258 / bizhub C658/C558/C458) <br> - Replace the scanner drive board. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) |
| 3 | - When original glass is being used <br> - When DF is being used: 1st side | None of the terminal pins of the connection cable between the CCD board (CN3 or PJ3) and the MFP board (CN1) is bent and a positive connection is made. | NO | Reconnect the connector. |
| 4 | - When original glass is being used <br> - When DF is being used: 1st side <br> - When DF-629 is being used: 2nd side | Replace the connection cable between the machine and the DF. This eliminates the trouble. | YES | Replace the connection cable. |
| 5 | - When original glass is being used <br> - When DF is being used: 1st side <br> - When DF-629 is being used: 2nd side | Select [Service Mode] -> [State Confirmation] -> [Selfdiagnostic] -> [Check All] and perform the function. Then, "NG" appears. | YES | Take relevant action corresponding to the check item in which "NG" has appeared. |
|  |  |  | NO | - Replace the CCD unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) <br> - Replace the MFP board. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 6 | DF-704 or dual scan document feeder is being used: 2nd side | bizhub C368/C308/C258: <br> Faulty connector connection the CIS power supply unit (J1), relay connector (P6), main body connection section (P1) and DC power supply (CN4). <br> bizhub C658/C558/C458: | YES | Reconnect the connector. |

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Faulty connector connection the DF power supply (CN1), relay connector (CN117), main body connection section (CN46) and DC power supply (CN004). |  |  |
| 7 | DF-704 or dual scan document feeder is being used: 2nd side | bizhub C368/C308/C258: <br> Faulty connector connection the CIS module (J221), dual scan image processing board (CN1) and MFP board (CN22). | YES | Reconnect the connector. |
|  |  | bizhub C658/C558/C458: <br> Faulty connector connection the CIS module (J101), dual scan image processing board (CN2, CN1) and MFP board (CN24). |  |  |
| 8 | DF-704 or dual scan document feeder is being used: 2nd side | Replace the connection cable between the CIS module and the MFP board. This eliminates the trouble. | YES | Replace the connection cable. |
| 9 | Service Mode -> Selfdiagnostic | Select [Service Mode] -> [State Confirmation] -> [Selfdiagnostic] -> [Check All] and perform the function. Then, "NG" appears. | YES | Take relevant action corresponding to the check item in which "NG" has appeared. |
|  |  |  | NO | - Replace the CIS module. (bizhub C368/C308/C258 / bizhub C658/C558/C458) <br> - Replace the dual scan image processing board. (bizhub C368/C308/C258 / bizhub C658/C558/C458) <br> - Replace the MFP board. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |

*1: Apply DURASURF KD-453S to the shaft. DURASURF is a product manufactured by Harves Co., Ltd. (http://www.harves.co.jp).
*2: Apply FLOIL No. 947P or Launa 40 oil to the scanner rails. FLOIL is a product manufactured by KANTO KASEI LTD. (http://www.kantokasei.co.jp/).

### 16.3.17 Uneven pitch

(1) Typical faulty images

The arrow in the exemplary image troubles indicates the paper feeding direction.

(2) Initial troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :--- | :--- | :--- | :--- |
| 1 | Paper Setting | The paper to be used for printing does not match the <br> paper type and size of paper setting selected on the <br> machine. | YES | Make the paper setting again on <br> the machine. |
| 2 | Service Mode -> <br> Stabilizer | Select [Service Mode] -> [Imaging Process Adjustment] <br> l> [Stabilizer] -> [Stabilization Only] and the image <br> trouble is eliminated. | NO | Go to the next step. |
| 3 | Service Mode -> <br> Gradation Adjust | Select [Service Mode] -> [Imaging Process Adjustment] <br> $->$ [Gradation Adjust] and the image trouble is <br> eliminated. | NO | Go to the next step. |
| 4 | Image check | Select [Service Mode] -> [Test Mode] -> [Halftone <br> Pattern]. Select "SINGLE", "HYPER", "Gradation", <br> "1-Sided", "CMYK", and "Full Bleed", enter "64" for <br> Density, and load tray 2 with A3 paper. Press the <br> start key. This runs a print cycle for C, M, Y, and K <br> in that order. <br> Check the image after printing and the abnormal <br> image occurs only with one color. | NO | Go to the 1-color troubleshooting <br> procedure. |
| mo to the 4-color troubleshooting |  |  |  |  |
| procedure. |  |  |  |  |

(3) 1-color troubleshooting procedure

| Step | Section | Check item for the faulty color | Result | Action for the faulty color |
| :---: | :--- | :--- | :--- | :--- |
| 1 | Uneven pitch at 94 mm <br> interval | Dirt, scratches, or foreign matter on the photo <br> conductor. | YES | • Clean. <br> - Replace the drum unit. <br> (bizhub C368/C308/C258 / |
| bizhub C658/C558/C458) |  |  |  |  |

| Step | Section | Check item for the faulty color | Result | Action for the faulty color |
| :---: | :---: | :---: | :---: | :---: |
| 2 | Uneven pitch at 28 mm interval | Dirt, scratches, or foreign matter on the developing roller. | YES | - Clean. <br> - Replace the developing unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 3 | Write section | Dirt or foreign matter on the dust-proof glass of the PH. | YES | Clean the PH window. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |
| 4 | Charging section | Foreign matter on charging roller. | YES | Lightly wipe the surface clean of foreign matter using hydro-wipe (65AA-99\#\#). <br> Note: Do not apply a strong force to the surface of the charging roller, as doing so can damage the surface. |
| 5 | Connector connection | bizhub C368/C308/C258: <br> Faulty connector connection the high voltage unit (CN1, CN2) and MFP board (CN22E, CN36E). | YES | Reconnect the connector. |
|  |  | bizhub C658/C558/C458: <br> Faulty connector connection the high voltage unit (CN1, CN2) and MFP board (CN30E, CN33E). | NO | - Replace the high voltage unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) <br> - Replace the MFP board. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |

(4) 4-color troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Uneven pitch | Dirt, scratches, or foreign matter on the transfer belt. | YES | - Clean. <br> - Replace the transfer belt unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 2 | Uneven pitch at 64 mm interval | Dirt or foreign matter on the 2nd transfer roller. | YES | - Remove the foreign matter. <br> - Replace the transfer roller unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) |
| 3 | Uneven pitch at 157 mm interval | Dirt, scratches, or foreign matter on the fusing belt. | YES | - Clean. <br> - Replace the fusing unit. (bizhub C368/C308/C258 / bizhub C658/C558 / bizhub C458) |
| 4 | Uneven pitch at 94 mm interval | Dirt, scratches, or foreign matter on the fusing pressure roller. | YES | - Clean. <br> - Replace the fusing unit. (bizhub C368/C308/C258 / bizhub C658/C558 / bizhub C458) |
| 5 | Paper path | There is dirty or foreign matter on paper path. | YES | Check or clean the paper path including the duplex section. |
|  |  |  | NO | - Replace the transfer belt unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) <br> - Replace the high voltage unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) <br> - Replace the MFP board. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |

### 16.3.18 Uneven gloss, Rough gloss

(1) Typical faulty images

The arrow in the exemplary image troubles indicates the paper feeding direction.

## (2) Troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :--- | :--- | :--- | :--- |
| 1 | Paper Setting | The paper to be used for printing does not match the <br> paper type and size of paper setting selected on the <br> machine. | YES | Make the paper setting again on <br> the machine. |
| 2 | Image checkSelect [Service Mode] -> [Test Mode] -> [Halftone <br> Pattern]. Select "SINGLE", "HYPER", "Gradation", <br> "1-Sided", "Black (1PC)", and "Full Bleed", enter <br> "255" for Density, and load tray 2 with A3 paper. <br> Press the start key. This runs a print cycle. <br> Check the image after printing and the abnormal <br> image is evident. (rough gloss) | YES | Go to the next step. |  |
| 3 | Service Mode-> Fusing <br> Temperature | Select [Service Mode] -> [Machine] -> [Fusing <br> Temperature] and lower the fusing temperature, and the <br> image trouble is eliminated. | NO | Return the fusing temperature to <br> the original one and go to the next <br> step. |
| 4 | Exit tray front roller, Exit <br> roller | Faulty pressure operation of the exit tray front roller or <br> exit roller. | YES | Correct. |
| 5 | Fusing unit | There is dirty or foreign matter on paper path of fusing <br> unit. | YES | Clean. (Disassembling the fusing <br> unit is prohibited.) |
| 6 | Fusing unit | Scratches on belt and roller in fusing unit. | YES | Replace the fusing unit. (bizhub <br> C368/C308/C258 / bizhub C658/ <br> C558 / bizhub C458) |

### 16.3.19 Poor fusing performance, Offset

(1) Typical faulty images

The arrow in the exemplary image troubles indicates the paper feeding direction.
[1]

[2]

[1] Poor fusing performance
[2] Offset
(2) Troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Paper Setting | The paper to be used for printing does not match the paper type and size of paper setting selected on the machine. | YES | Make the paper setting again on the machine. |
| 2 | Image check: Poor fusing performance | - Select [Service Mode] -> [Test Mode] -> [Halftone Pattern]. Select "SINGLE", "HYPER", "Gradation", "1-Sided", "Black (1PC)", and "Full Bleed", enter " 64 " for Density, and load tray 2 with A3 paper. Press the start key. This runs a print cycle. <br> - Check the image after printing and the abnormal image is evident. | YES | Go to the next step. |
| 3 | Image check: Poor fusing performance | - Select [Service Mode] -> [System 2] -> [Smart Fusing Control] and select [Prohibit]. <br> - Check the image after printing and the abnormal image is evident. | YES | Return the setting to the original one and go to the next step. |
| 4 | Image check: Offset | - Select [Service Mode] -> [Test Mode] -> [Gradation Pattern]. Select "SINGLE", "HYPER", "Gradation", "1-Sided", "8 Color", "Front Half", and "12 gradations", and load tray 2 with A3 paper. Press the start key. This runs a print cycle. <br> - Check the image after printing and the abnormal image is evident. | YES | Go to the next step. |
| 5 | Service Mode -> Fusing Temperature | Select [Service Mode] -> [Machine] -> [Fusing <br> Temperature] and make the necessary adjustment, and the image trouble is eliminated. <br> * Poor fusing performance: Decrease the setting value * Offset: Increase the setting value | NO | Return the setting value to the original one and go to the next step. |
| 6 | Fusing unit | There is dirty or foreign matter on paper path of fusing unit. | YES | Clean. (Disassembling the fusing unit is prohibited.) |

| Step | Section | Check item | Result | Action |
| :---: | :--- | :--- | :--- | :--- |
| 7 | Fusing unit | Scratches on belt and roller in fusing unit. | YES | Replace the fusing unit. (bizhub <br> C368/C308/C258 / bizhub C658/ <br> C558 / bizhub C458) |
|  |  |  | NO <br> Replace the power supply of <br> fusing. |  |

### 16.3.20 Brush effect, Image bleeding

## (1) Typical faulty images

The arrow in the exemplary image troubles indicates the paper feeding direction.

## [1]

## [2]

[1] Brush effect $\quad[2]$ Image bleeding
(2) Initial troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Paper Setting | The paper to be used for printing does not match the paper type and size of paper setting selected on the machine. | YES | Make the paper setting again on the machine. |
| 2 | Damp paper | Paper is damp. | YES | Change paper to one just unwrapped from its package. |
| 3 | Service Mode -> Stabilizer | Select [Service Mode] -> [Imaging Process Adjustment] -> [Stabilizer] -> [Stabilization Only] and the image trouble is eliminated. | NO | Go to the next step. |
| 4 | Service Mode -> Gradation Adjust | Select [Service Mode] -> [Imaging Process Adjustment] -> [Gradation Adjust] and the image trouble is eliminated. | NO | Go to the next step. |
| 5 | Image check | - Select [Service Mode] -> [Test Mode] -> [Lattice Pattern]. Select "SINGLE", "HYPER", "Gradation", "1-Sided", "CMYK", "600dpi", and "Normal", enter "10" for CD width, "10" for FD width, and "64" for Density, and load tray 2 with A3 paper. Press the start key. This runs a print cycle for C, M, Y, and K in that order. <br> - Check the image after printing and the abnormal image is evident. | YES | Go to the next step. |
| 6 | Transfer belt unit | Dirt, scratches, or foreign matter on the transfer belt. | YES | - Clean. <br> - Replace the transfer belt unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 7 | 2nd transfer section | Dirt or foreign matter on the 2nd transfer roller. | YES | - Remove the foreign matter. <br> - Replace the transfer roller unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) |
| 8 | Service Mode -> Fusing Temperature | Select [Service Mode] -> [Machine] -> [Fusing <br> Temperature] and make the necessary adjustment, and the image trouble is eliminated. <br> * Increase or decrease the setting value | NO | Return the setting value to the original one and go to the next step. |
| 9 | Service Mode -> Fusing Transport Speed | Select [Service Mode] -> [Machine] -> [Fusing Transport Speed] and make the necessary adjustment, and the image trouble is eliminated. <br> * Brush effect: Increase or decrease the setting value * Image bleeding: Decrease the setting value | NO | Return the setting value to the original one and go to the next step. |
| 10 | Fusing unit | There is dirty or foreign matter on paper path of fusing unit. | YES | Clean. (Disassembling the fusing unit is prohibited.) |
| 11 | Fusing unit | Scratches on belt and roller in fusing unit. | YES | Replace the fusing unit. (bizhub C368/C308/C258 / bizhub C658/ C558 / bizhub C458) |
|  |  |  | NO | Replace the power supply of fusing. |

### 16.3.21 Blurred fine lines

## (1) Typical faulty images

The arrow in the exemplary image troubles indicates the paper feeding direction.

(2) Initial troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :--- | :--- | :--- | :--- |
| 1 | Damp paper | Paper is damp. | YES | Change paper to one just <br> unwrapped from its package. |
| 2 | Paper Setting | The paper to be used for printing does not match the <br> paper type and size of paper setting selected on the <br> machine. | YES | Make the paper setting again on <br> the machine. |
| 3 | Unclear thin line in main <br> scan direction | Select [Service Mode] -> [Machine] -> [LD adjustment] - <br> $>$ [LD Light Width Adjustment] and the image trouble is <br> eliminated. | NO | Return the setting value to the <br> original one and go to the next <br> step. |
| 4 | Service Mode -> <br> Stabilizer | Select [Service Mode] -> [Imaging Process Adjustment] <br> -> [Stabilizer] -> [Stabilization Only] and the image <br> trouble is eliminated. | NO | Go to the next step. |
| 5 | Service Mode -> <br> Gradation Adjust | Select [Service Mode] -> [Imaging Process Adjustment] <br> $->$ [Gradation Adjust] and the image trouble is <br> eliminated. | NO | Go to the next step. |
| 6 | Image check | Select [Service Mode] -> [Test Mode] -> [Lattice <br> Pattern]. Select "SINGLE", "FEET", "1-Sided", <br> "CMYK", "600dpi", and "Normal", enter "3" for CD <br> width, "3" for FD width, and "255" for Density, and <br> load tray 2 with A3 paper. Press the start key. This <br> runs a print cycle for C, M, Y, and K in that order. <br> Check the image after printing and the abnormal <br> image is evident. | YES | Go to engine troubleshooting <br> procedure. |
| Go to scanner troubleshooting |  |  |  |  |
| procedure. |  |  |  |  |

## (3) Engine troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Write section | Dirt or foreign matter on the dust-proof glass of the PH of the color which is responsible for the abnormal image. | YES | Clean the PH window. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |
| 2 | Charging section | Foreign matter on charging roller of the color which is responsible for the abnormal image. | YES | Lightly wipe the surface clean of foreign matter using hydro-wipe (65AA-99\#\#). <br> Note: Do not apply a strong force to the surface of the charging roller, as doing so can damage the surface. |
| 3 | Photo conductor section | Dirt or foreign matter on the photo conductor of the PH of the color which is responsible for the abnormal image. | YES | - Clean. <br> - Replace the drum unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 4 | Transfer belt unit | Dirt, scratches, or foreign matter on the transfer belt. | YES | - Clean. <br> - Replace the transfer belt unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
|  |  |  | NO | Replace the PH unit. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |

(4) Scanner troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :--- | :--- | :--- | :--- |
| 1 | Original | Original is folded, bent, or raised. | YES | Change the original. |
| 2 | Original Type | Select [Copy setting] -> [Original Type] and change the <br> setting, and the image trouble is eliminated. | YES | Correct the setting. |
| 3 | When original glass is <br> being used | Original glass tilts. | YES | Corrected to the correct position. |

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 4 | When DF is being used | DF does not lie flat. | YES | - Adjust the DF height. (DF-704 / DF-629 / Dual scan document feeder) <br> - Replace DF if it is deformed or hinges are broken. |
| 5 | - When DF is being used: 1st side <br> - When DF-629 is being used: 2nd side | Document reading glass tilts. | YES | Corrected to the correct position. |
|  |  |  | NO | - Replace the LED exposure unit. (bizhub C368/C308/ C258 / bizhub C658/C558/ C458) <br> - Replace the CCD unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 6 | DF-704 or dual scan document feeder is being used: 2nd side | CIS glass or CIS cleaning brush is tilted. | YES | Corrected to the correct position. |
|  |  |  | NO | Replace the CIS module. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |

### 16.3.22 Moire

## (1) Typical faulty images

The arrow in the exemplary image troubles indicates the paper feeding direction

(2) Initial troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Original | Original is damaged or dirty. | YES | Change the original. |
| 2 | Original Type | Select [Copy setting] -> [Original Type] and change the setting, and the image trouble is eliminated. | NO | Go to the next step. |
| 3 | Original direction | Change the direction in which the original is placed. This eliminates moire. | YES | Change the original direction. |
| 4 | Service Mode -> Stabilizer | Select [Service Mode] -> [Imaging Process Adjustment] -> [Stabilizer] -> [Stabilization Only] and the image trouble is eliminated. | NO | Go to the next step. |
| 5 | Service Mode -> Gradation Adjust | Select [Service Mode] -> [Imaging Process Adjustment] -> [Gradation Adjust] and the image trouble is eliminated. | NO | Go to the next step. |
| 6 | Image check | - Select [Service Mode] -> [Test Mode] -> [Halftone Pattern]. Select "SINGLE", "HYPER", "Gradation", "1-Sided", "CMYK", and "Full Bleed", enter "64" for Density, and load tray 2 with A3 paper. Press the start key. This runs a print cycle for $\mathrm{C}, \mathrm{M}, \mathrm{Y}$, and K in that order. <br> - Check the image after printing and the abnormal image is evident. | YES | Go to engine troubleshooting procedure. |
|  |  |  | NO | Go to scanner troubleshooting procedure. |

## (3) Engine troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Service Mode -> Paper Feed Direction Adj. | Select [Service Mode] -> [Machine] -> [Printer Area] -> [Paper Feed Direction Adj.] and make the necessary adjustment, and the image trouble is eliminated. | NO | Go to the next step. |
| 2 | Service Mode -> Initialize <br> + Image Stabilization | Select [Service Mode] -> [Imaging Process Adjustment] -> [Stabilizer] -> [Initialize + Image Stabilization] and [Gradation Adjust], and the image trouble is eliminated. | YES | Readjust. |
|  |  |  | NO | - Replace the PH unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) <br> - Replace the MFP board. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |

(4) Scanner troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 1 | When original glass is being used: Sub Scan Zoom Adj. | Select [Service Mode] -> [Machine] -> [Scan Area] -> [Sub Scan Zoom Adj.] and make the necessary adjustment, and the image trouble is eliminated. | YES | Readjust. |
|  |  |  | NO | Replace the CCD unit. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |
| 2 | When DF is being used: 1st side: Feed Zoom | Select [Service Mode] -> [ADF] -> [Feed Zoom] and make the necessary adjustment, and the image trouble is eliminated. | YES | Readjust. |
|  |  |  | NO | Replace the CCD unit. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |
| 3 | When DF-704 or dual scan document feeder is being used: 2nd side: FDMag. Adj. (B) | Select [Service Mode] -> [ADF] -> [FD-Mag. Adj. (B)] and make the necessary adjustment, and the image trouble is eliminated. | NO | Go to the next step. |
| 4 | When DF-704 or dual scan document feeder is being used: 2nd side: Main Scanning Direction Zoom | Select [Service Mode] -> [ADF] -> [Main Scanning Direction Zoom] and make the necessary adjustment, and the image trouble is eliminated. | YES | Readjust. |
|  |  |  | NO | Replace the CIS module. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |

### 16.3.23 Distorted image

## (1) Typical faulty images

The arrow in the exemplary image troubles indicates the paper feeding direction.

(2) Troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Installation state | Machine not installed on a flat site. | YES | Install the machine horizontally. |
| 2 | Original Type | Select [Copy setting] -> [Original Type] and change the setting, and the image trouble is eliminated. | YES | Correct the setting. |
| 3 | When original glass is being used | Original glass not installed properly. | YES | Corrected to the correct position. |
|  |  |  | NO | Replace the CCD unit. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |
| 4 | - When DF is being used: Distortion on 1st side <br> - When DF-629 is being used: Distortion on 2nd side | CCD board not installed properly. | YES | Corrected to the correct position. |
|  |  |  | NO | Replace the CCD unit. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |
| 5 | DF-704 or dual scan document feeder is being used: Distortion on 2nd side | CIS module not installed properly. | YES | Corrected to the correct position. |
|  |  |  | NO | Replace the CIS module. (bizhub C368/C308/C258 / bizhub C658/ C558/C458) |

### 16.3.24 ACS malfunction

(1) Typical faulty images

The arrow in the exemplary image troubles indicates the paper feeding direction.

## (2) Troubleshooting procedure

| Procedure | Section | Check item | Result | Action |
| :---: | :--- | :--- | :--- | :--- |
| 1 | Original Type | Select [Copy setting] -> [Original Type] and change the <br> setting, and the image trouble is eliminated. | YES | Correct the setting. |
| 2 | Original direction | Change the direction in which the original is placed. <br> This eliminates the trouble. | YES | Change the original direction. |
| 3 | User Settings -> Auto <br> Color Level Adjust. | Select [Utility] -> [User Settings] -> [System Settings] -> <br> [Auto Color Level Adjust.] and the image trouble is <br> eliminated. | YES | Readjust. |

### 16.3.25 Abnormal image

(1) Typical faulty images

The arrow in the exemplary image troubles indicates the paper feeding direction.

| $[1] \quad$ Data on the previous page | [2] $\quad$ Data on the next page |
| :--- | :--- | :--- |

## (2) Troubleshooting procedure

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
| 1 | When original glass is being used When DF is being used: 1st side | None of the terminal pins of the connection cable between the CCD board (CN3 or PJ3) and the MFP board (CN1) is bent and a positive connection is made. | NO | Reconnect the connector. |
| 2 | When original glass is being used When DF is being used: 1st side | Replace the connection cable between the CCD board and the MFP board. This eliminates the trouble. | YES | Replace the connection cable. |
|  |  |  | NO | - Replace the CCD unit. (bizhub C368/C308/C258 / bizhub C658/C558/C458) <br> - Replace the MFP board. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |
| 3 | DF-704 or dual scan document feeder is being used: 2nd side | bizhub C368/C308/C258: <br> Faulty connector connection the CIS power supply unit (J1), relay connector (P6), main body connection section (P1) and DC power supply (CN4). | YES | Reconnect the connector. |
|  |  | bizhub C658/C558/C458: <br> Faulty connector connection the DF power supply (CN1), relay connector (CN117), main body connection section (CN46) and DC power supply (CN004). |  |  |
| 4 | DF-704 or dual scan document feeder is being used: 2nd side | bizhub C368/C308/C258: <br> Faulty connector connection the CIS module (J221), dual scan image processing board (CN1) and MFP board (CN22). | YES | Reconnect the connector. |
|  |  | bizhub C658/C558/C458: <br> Faulty connector connection the CIS module (J101), dual scan image processing board (CN2, CN1) and MFP board (CN24). |  |  |
| 5 | DF-704 or dual scan document feeder is being used: 2nd side | Replace the connection cable between the CIS module and the dual scan image processing board. This eliminates the trouble. | YES | Replace the connection cable. |
| 6 | Service Mode -> Selfdiagnostic | Select [Service Mode] -> [State Confirmation] -> [Selfdiagnostic] -> [Check All] and perform the function. Then, "NG" appears. | YES | Take relevant action corresponding to the check item in which "NG" has appeared. |
|  |  |  | NO | - Replace the CIS module. (bizhub C368/C308/C258 / bizhub C658/C558/C458) |

| Step | Section | Check item | Result | Action |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Replace the dual scan image <br> processing board. (bizhub <br> C368/C308/C258 / bizhub |
|  |  |  |  | C658/C558/C458) <br>  |
|  |  |  |  | Replace the MFP board. <br> (bizhub C368/C308/C258/ <br> bizhub C658/C558/C458) |

## 17. IC PROTECTOR

### 17.1 Outline

- To increase product safety, this MFP has an IC protector (ICP) installed in each board. ICP is a component that protects IC. If the amount of the current supplied to the electrical parts such as motor exceeds the set level, ICP trips to protect IC from over current. The following list contains ICP installed in each board, related devices, and symptoms that occur when ICP trips.

### 17.2 IC protector list

### 17.2.1 bizhub C368/C308/C258

## (1) MFP board

| ICP No. | Symbol | Target part name | When ICP trips |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  | Symptom in each load | Trouble code and others |
| ICP1E | - | LCC, cabinet | No operation | $\begin{gathered} \text { C0202, C0204, } \\ \text { C0206, C0208, } \\ \text { C0210 } \end{gathered}$ |
|  |  |  | Misfeed at transport section | - |
| ICP2E | CL6 | ADU transport clutch | Misfeed at duplex transport section | - |
|  | CL5 | 1st transfer pressure clutch | Transfer belt fault at initial position return | C2152 |
|  | CL8 | Paper exit clutch | Misfeed at exit section | - |
|  | CL3 | Tray 1 paper feed clutch | Misfeed at tray 1 feed section | - |
|  | CL1 | Tray 2 paper feed clutch | Misfeed at tray 2 feed section | - |
|  | CL2 | Tray2 vertical transport clutch | Misfeed at tray 2 feed section | - |
|  | CL7 | Bypass paper feed clutch | Misfeed at manual bypass feed section | - |
| ICP3E | SD4 | Developing solenoid | Faulty image | - |
|  | SD3 | Gate switch solenoid | Misfeed at exit section | - |
|  | SD1 | Bypass pick-up solenoid | Manual feed up/down abnormality | C0211 |
|  | FM8 | Paper cooling fan | Paper cooling fan failure to turn | C3302 |
| ICP4E | FRB | Front side board | Faulty image | - |
|  | CL4 | Registration clutch | Misfeed at transport section | - |
|  | SD2 | IDC sensor shutter solenoid | Image stabilization abnormally terminated | - |
| ICP7E | USBB | USB board | No operation | - |
| ICP8E | - | 3.3-V DC/DC converter in mechanical controller of MFP board | Engine communication data error | C 5605 |
|  | FRB | Front side board | Front side communication error | C5603 |
| ICP9E | - | DF | Unable to be detected | - |
|  | - | Scanner unit | Control panel operation failure | - |
| ICP10E | - | Cabinet | Misfeed at LCT paper feed section | - |
| ICP12E | FRB | Front side board (LD board, TCR sensor, DR new detection circuit) | Cyan TCR sensor failure | C2561 |
|  |  |  | Magenta TCR sensor failure | C2562 |
|  |  |  | Yellow TCR sensor failure | C2563 |
|  |  |  | Black TCR sensor failure | C2564 |
|  | INDEXB | Index board | - | - |
|  | TCSB/Y | Toner cartridge set board/Y | Toner cartridge set board output does not change. | - |
|  | TCSB/M | Toner cartridge set board/M |  | - |
|  | TCSB/C | Toner cartridge set board/C |  | - |
|  | TCSB/K | Toner cartridge set board/K |  | - |
| ICP14E | FM14 | Exhaust fan/1 | Clean unit fan failure to turn | C5360 |
|  | FM15 | Exhaust fan/2 |  |  |
|  | FM16 | Suction fan |  |  |
| ICP15E | HV | High voltage unit | Faulty image | - |

### 17.2.2 bizhub C658/C558/C458

(1) MFP board

| ICP No. | Symbol | Target part name |  | When ICP trips |  |
| :--- | :---: | :---: | :--- | :---: | :---: |

|  |  |  | Symptom in each load | Trouble code and others |
|  | M16 | Skew correction motor/M |  |  |
|  | M17 | Skew correction motor/Y |  |  |

(3) Expansion control board

| ICP No. | Symbol | Target part name |  | When ICP trips |  |
| :--- | :---: | :---: | :--- | :---: | :---: |
|  |  |  | Symptom in each load | Trouble code and <br> others |  |
| ICP2 | - | TB new detection board | Unable to detect new article | - |  |

17.2.3 Dual scan document feeder
(1) DF control board

| ICP No. | Symbol | Target part name | When ICP trips |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  | Symptom in each load | Trouble code and others |
| ICP1 | M3 | Reading motor | DF image reading section JAM | - |
| ICP2 | M1 | Paper feed motor | Misfeed at feed section | - |
| ICP3 | M2 | Registration motor | Misfeed at transport section | - |
| ICP4 | - | Circuit that produces DC5V | Unable to produce DC5V in DF and MFP unable to detect DF | C6104 |
| ICP5 | M5 | Lift-up motor | Lift up mechanism trouble (Upward movement) | C8103 |
| ICP6 | SD1 | Stamp solenoid | Unable to place a stamp | - |
| ICP7 | PS1 | Empty sensor | Not recovered from the sleep mode | - |
| ICP8 | M8 | Front side cleaning motor | Glass cleaning mechanism trouble | C8107 |
|  | M7 | Back side cleaning motor | Back side cleaning home sensor abnormality (normal) | C6105 |
|  | M4 | Paper exit motor | Paper exit section jam | - |
| ICP9 | M6 | Reading roller pressure/retraction motor | Before reading pressure welding alienation mechanism trouble | C8101 |
| ICP10 | FM | Cooling fan motor | Cooling fan motor's failure | C8302 |
|  | CL1 | Take-up clutch | Misfeed at feed section | - |
| ICP11 | SCB | Sensor control board | Multi feed detection jam | - |
|  | MFDB/1 | Multi feed detection board/1 (transmitter) | Multi feed detection board failure | C8402 |
|  | MFDB/2 | Multi feed detection board/2 (receiver) |  |  |
| ICP15 | PS4 | After separate sensor | Misfeed at transport section | - |
|  | PS5 | Registration sensor | Misfeed at transport section | - |
| ICP16 | PS6 | Before read sensor | DF image reading section JAM | - |
|  | PS11 | Length Sensor2 | Wrong original size detection | - |

(2) DF power supply

| ICP No. | Symbol | Target part name | When ICP trips |  |
| :--- | :---: | :---: | :---: | :---: |
|  |  |  | Symptom in each load | Trouble code and <br> others |
| ICP1 | - | CIS unit | CIS LED does not light up. | C6753 |

### 17.2.4 DF-629

(1) DF control board

| ICP No. | Symbol | Target part name | When ICP trips |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  | Symptom in each load | Trouble code and others |
| F1 | - | DC to DC converter input section 24 V line | Unable to produce DC24V in DF and MFP unable to detect DF | - |
| F2 | - | DC to DC converter input section 5V line | Unable to produce DC5V in DF and MFP unable to detect DF | - |
| F3 | M2 | Document feed motor | Misfeed at feed section | - |
| F4 | M3 | Registration motor | Misfeed at transport section | - |

| ICP No. | Symbol | Target part name | When ICP trips |  |
| :--- | :---: | :--- | :--- | :---: |
|  |  |  | Symptom in each load | Trouble code and <br> others |
| F5 | M1 | Document reading motor | Misfeed at transport section | - |
| F6 | FM1 | DF cooling fan motor | Cooling fan trouble | C8302 |
|  | SD1 | Document exit roller release solenoid | Misfeed at switchback section | - |
| F8 | M5 | Reading roll release motor | Before reading pressure welding alienation <br> mechanism trouble | C8101 |
| F9 | - | Stamp solenoid | Unable to place a stamp | - |

### 17.2.5 DF-704

(1) DF control board

| ICP No. | Symbol | Target part name | When ICP trips |  |
| :--- | :---: | :--- | :--- | :---: |
|  |  |  | Symptom in each load | Trouble code and <br> others |
| F1 | - | DC to DC converter input section 24V line | Unable to produce DC24V in DF and MFP unable <br> to detect DF | - |
| F2 | - | DC to DC converter input section 5V line | Unable to produce DC5V in DF and MFP unable <br> to detect DF | - |
| F3 | M2 | Document feed motor | Misfeed at feed section | - |
| F4 | M3 | Registration motor | Misfeed at transport section | - |
| F5 | M1 | Document reading motor | Misfeed at transport section | Cooling fan trouble |
| F6 | FM1 | DF cooling fan motor | Before reading pressure welding alienation <br> mechanism trouble | C8101 |
| F8 | M4 | Reading roll release motor | Unable to place a stamp | - |
| F9 | - | Stamp solenoid |  | - |

(2) CIS power supply

| ICP No. | Symbol | Target part name |  | When ICP trips |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Symptom in each load | Trouble code and <br> others |  |
| F1 | - | DC to DC converter input section 12V line | CIS LED lighting failure | C9403 |  |
| F2 | - | DC to DC converter input section 5V line | CIS LED lighting failure | C9403 |  |

### 17.2.6 JS-506

(1) JS control board

| ICP No. | Symbol | Target part name | When ICP trips |  |
| :---: | :---: | :--- | :--- | :---: |
|  |  |  | Symptom in each load |  |
| ICP1 | - | CPU power supply | No operation (Due to no power supply to CPU, <br> FS connection not detected) | - |
| ICP2 | - | DC to DC converter input section 24V <br> line | Unable to produce DC24V in FS and MFP <br> unable to detect FS | - |
| ICP3 | M1 | Tray shift motor | Shift motor drive malfunction | C1182 |

### 17.2.7 FS-534

(1) FS control board

| ICP No. | Symbol | Target part name | When ICP trips |  |
| :--- | :---: | :--- | :--- | :---: |
|  |  |  | Symptom in each load | Trouble code and <br> others |
| F1 | - | Between connection with MFP and 24V <br> power line | No operation (Due to no power supply to CPU, <br> FS connection not detected) | - |

17.2.8 FS-533
(1) FS control board

| ICP No. | Symbol | Target part name | When ICP trips |  |
| :--- | :---: | :--- | :--- | :---: |
|  |  |  | Symptom in each load | Trouble code and <br> others |
| F1 | - | All ICs and actuators | No operation (Due to no power supply to CPU, <br> FS connection not detected) | - |
| CP1 | - | DC to DC converter input section 5V line | No operation (Due to no power supply to CPU, <br> FS connection not detected) | - |

| ICP No. | Symbol | Target part name | When ICP trips |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  | Symptom in each load | Trouble code and others |
| CP2 | - | Regulator | No operation (Due to no power supply to CPU, FS connection not detected) | - |
| CP3 | - | DC to DC converter input section $24 V$ line | No operation (Due to no power supply to CPU, FS connection not detected) | - |
| CP21 | SD101 | Paper surface detect solenoid | No operation | - |
| CP22 | SD102 | Batch solenoid | No operation | - |
| CP23 | SD103 | Paper exit roller solenoid | No operation | - |
| CP101 | M101 | Paper conveyance motor | Misfeed at transport section | - |

| CP104 | M104 | Exit roller lift up motor | Exit roller pressure/ retraction malfunction | C11A1 |
| CP105 | M105 | Alignment motor/F | Alignment plate motor/F malfunction | C1103 |
|  | M106 | Alignment motor/R | Alignment plate motor/R malfunction | C1140 |
| CP107 | M107 | Stapler movement motor | Stapler movement motor malfunction | C1106 |
| CP109 | M109 | Tray lift up motor | Main tray up/down motor drive malfunction | C1102 |

### 17.2.9 PK-519

(1) PK control board

| ICP No. | Symbol | Target part name |  | When ICP trips |  |
| :--- | :---: | :--- | :--- | :--- | :---: |
|  |  |  | Symptom in each load | Trouble code and <br> others |  |
| F201 | M201 | Punch motor | Punch drive motor's malfunction | C1132 |  |

### 17.2.10 FS-536/FS-536SD

(1) FS control board

| ICP No. | Symbol | Target part name | When ICP trips |  |
| :--- | :---: | :--- | :--- | :---: |
|  |  |  | Symptom in each load | Trouble code and <br> others |
| F1 | - | 24V to 5V DC to DC converter | Unable to be detected | - |
| F2 | M11 | Main tray up/down motor | Main tray up/down motor's drive malfunction | C1102 |

## (2) SD control board

| ICP No. | Symbol | Target part name | When ICP trips |  |
| :--- | :---: | :---: | :--- | :---: |
|  |  |  | Symptom in each load | Trouble code and <br> others |
| F1 | - | 24 V to 5V DC to DC converter | Unable to be detected <br> Unable to be detected <br> "There is an open component." display |  |

### 17.2.11 FS-537/FS-537SD

(1) FS control board

| ICP No. | Symbol | Target part name | When ICP trips |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  | Symptom in each load | Trouble code and others |
| F1 | - | 24 V to 5V DC to DC converter | Unable to be detected | - |
| F2 | ZUDTB | ZU relay board | The paper tray is lowered and becomes full | - |
| F3 | M6 | Main tray up/down motor | Main tray up/down motor's drive malfunction | C1102 |
| F4 | M34 | Paper transport belt motor | Paper transport belt motor's malfunction | C1152 |

## (2) SD control board

| ICP No. | Symbol | Target part name | When ICP trips |  |
| :--- | :---: | :---: | :--- | :---: |
|  |  | Symptom in each load |  | Trouble code and <br> others |
| F1 | - | 24 V to 5V DC to DC converter | Unable to be detected <br> Unable to be detected <br> "There is an open component." display | - |

### 17.2.12 PK-523

(1) Punch control board

| ICP No. | Symbol | Target part name | When ICP trips |  |
| :--- | :---: | :--- | :--- | :---: |
|  |  |  | Symptom in each load | Trouble code and <br> others |
| ICP1 | - | DC5V sensor and others in the board | Finisher communication error (Finisher <br> detection) | C1014 |
| ICP2 | M302 | Punch oscillating motor | Punch oscillating motor's drive malfunction | C1127 |

### 17.2.13 PI-507

(1) PI drive board

| $[3]$ | Tray 4 paper feed motor (M121) | $[4]$ | PC dehumidifier heater (DH111) |
| $[5]$ | Tray 4 lift-up motor (M123) | $[6]$ | Tray 3 lift-up motor (M113) |

| $[7] \quad$ Tray 3 paper feed motor (M111) | $-\quad-$ |
| :--- | :--- | :--- |

### 1.8 PC-410 (Option)

### 1.8.1 Board/switch/sensor/others

| $[1]$ | Right bottom door sensor (PS131) | $[2]$ | Main tray upper limit sensor (PS136) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Main tray upper paper empty sensor (PS137) | $[4]$ | Vertical transport sensor (PS133) |
| $[5]$ | Paper feed sensor (PS132) | $[6]$ | Tray 3 paper empty indicator board (PEIB/3) |
| $[7]$ | Cassette set sensor (PS143) | $[8]$ | Main tray paper empty sensor (PS134) |
| $[9]$ | Shifter stop/lower limit position sensor (PS138) | $[10]$ | Division board sensor (PS142) |
| $[11]$ | Shifter home sensor (PS139) | $[12]$ | Sub tray paper empty sensor (PS140) |
| $[13]$ | Sub tray paper remaining amount sensor (PS141) | $[14]$ | PC control board (PCCB) |
| $[15]$ | Main tray paper near empty sensor (PS135) | - | - |

### 1.8.2 Load

| $[1]$ | Vertical transport motor (M132) | $[2]$ | Elevator motor (M134) |
| :--- | :--- | :--- | :--- |
| $[3]$ | PC dehumidifier heater (DH111) | $[4]$ | Shifter motor (M133) |
| $[5]$ | Paper feed motor (M131) | - | - |

### 1.9 PC-415 (Option)

### 1.9.1 Board/switch/sensor/others

| $[1]$ | Right bottom door sensor (PS131) | $[2]$ | Main tray upper limit sensor (PS136) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Main tray upper paper empty sensor (PS137) | $[4]$ | Vertical transport sensor (PS133) |
| $[5]$ | Paper feed sensor (PS132) | $[6]$ | Tray 3 paper empty indicator board (PEIB/3) |
| $[7]$ | Cassette set sensor (PS143) | $[8]$ | Main tray paper empty sensor (PS134) |
| $[9]$ | Shifter stop/lower limit position sensor (PS138) | $[10]$ | Division board sensor (PS142) |
| $[11]$ | Shifter home sensor (PS139) | $[12]$ | Sub tray paper empty sensor (PS140) |
| $[13]$ | Sub tray paper remaining amount sensor (PS141) | $[14]$ | Dehumidifier relay board (PCRYB) * |
| $[15]$ | Dehumidification heater switch (SW4) * | $[16]$ | PC control board (PCCB) |
| $[17]$ | Main tray paper near empty sensor (PS135) | - | - |

- *: Japan model only

### 1.9.2 Load

| $[1]$ | Vertical transport motor (M132) | $[2]$ | Elevator motor (M134) |
| :--- | :--- | :--- | :--- |
| $[3]$ | PC dehumidifier heater (DH111) | $[4]$ | Shifter motor (M133) |
| $[5]$ | Paper feed motor (M131) | - | - |

### 1.10 LU-302 (Option)

| $[1]$ | LU door switch (MS1) | $[2]$ | LU near empty sensor/2 (PS6) |
| :--- | :--- | :--- | :--- |
| $[3]$ | LU paper empty sensor (PS4) | $[4]$ | Tray LED (LED) |
| $[5]$ | Dehumidification heater (DH) | $[6]$ | LU paper feed sensor (PS3) |
| $[7]$ | LU upper limit sensor (PS2) | $[8]$ | LU set sensor (PS1) |
| $[9]$ | LU lift-up motor (M1) | $[10]$ | LU paper feed motor (M2) |
| $[11]$ | LU transport motor (M3) | $[12]$ | LU drive board (LUDB) |
| $[13]$ | LU near empty sensor/1 (PS5) | - | - |

### 1.11 LU-207 (Option)

| $[1]$ | LU door switch (MS1) | $[2]$ | Tray LED (LED) |
| :--- | :--- | :--- | :--- |
| $[3]$ | LU paper empty sensor (PS4) | $[4]$ | Dehumidification heater (DH) |
| $[5]$ | LU set sensor/Fr (PS7) | $[6]$ | LU paper feed sensor (PS3) |
| $[7]$ | LU upper limit sensor (PS2) | $[8]$ | LU lift-up motor (M1) |
| $[9]$ | LU set sensor/Rr (PS1) | $[10]$ | LU near empty sensor/2 (PS6) |
| $[11]$ | LU paper feed motor (M2) | $[12]$ | LU transport motor (M3) |
| $[13]$ | LU drive board (LUDB) | $[14]$ | LU near empty sensor/1 (PS5) |

### 1.12 JS-506 (Option)

| $[1]$ | Exit tray1 full sensor (PS2) | $[2]$ | Tray shift motor (M1) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Tray shift home sensor (PS1) | $[4]$ | JS control board (JSCB) |

### 1.13 FS-534 (Option)

| $[1]$ | Main tray up/down motor (M11) | $[2]$ | FNS discharge motor (M3) |
| :--- | :--- | :--- | :--- |
| $[3]$ | FNS entry transport motor (M2) | $[4]$ | FNS paddle motor (M5) |
| $[5]$ | Receiving roller retraction motor (M4) | $[6]$ | Trailing edge stopper motor (M6) |
| $[7]$ | Alignment motor/Front (M7) | $[8]$ | Bundle eject motor (M10) |
| $[9]$ | Pre-eject drive motor (M9) | $[10]$ | Paper receiving control motor (M12) |
| $[11]$ | Side stapler movement motor (M13) | $[12]$ | Alignment motor/Rear (M8) |

| $[1]$ | Stacker motor sensor (PS25) | $[2]$ | Sub tray full detection sensor/out (PS9) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Main tray upper position detect switch (SW2) | $[4]$ | Pre-eject away sensor (PS22) |
| $[5]$ | Sub tray exit sensor (PS8) | $[6]$ | Staple stacker paper detection sensor (PS31) |
| $[7]$ | Pre-eject home sensor (PS21) | Trailing edge stopper home position detection sensor <br> (PS20) |  |
| $[9]$ | FNS entrance sensor (PS4) | $[10]$ | Upper cover open/close detection sensor (PS32) |
| $[11]$ | Sub tray full detection sensor/in (PS10) | Exchange folded paper output sensor (PS30) |  |
| $[13]$ | Saddle exit sensor (PS5) | $[16]$ | Receiving roller retraction sensor (PS11) |
| $[15]$ | Upper paddle home position detection sensor (PS14) | $[18]$ | Main tray upper sensor/in (PS7) |
| $[17]$ | Alignment plate/F home sensor (PS12) | $[22]$ | Stapler position sensor (Center) (PS24) |
| $[19]$ | Paper delivery control sensor (PS28) | $[24]$ | Pre-eject encorder sensor (PS15) |
| $[21]$ | Gripper motor sensor (PS17) | $[26]$ | Gripper home position sensor (PS18) |
| $[23]$ | Main tray full detection sensor (PS29) | $[28]$ | Main tray upper position sensor/R (PS26) |
| $[25]$ | Main tray exit sensor (PS16) | $[30]$ | Alignment plate/R home sensor (PS13) |
| $[27]$ | Stapler home position sensor (Rear) (PS23) | $[32]$ | FS control board (FSCB) |
| $[29]$ | Main tray upper sensor/out (PS6) | Gripper position detection sensor (PS19) |  |
| $[31]$ | Gration sensor/F (PS27) |  |  |

| $[1]$ | 3rd exit tray full sensor (PS1) | $[2]$ | $R U$ entrance sensor (PS2) |
| :--- | :--- | :--- | :--- |
| $[3]$ | $R U$ cover open/close detection sensor (PS3) | $[4]$ | $R U$ transport motor (M1) |

### 1.14 PK-520 (Option)

| $[1]$ | Punch dust full sensor/out (PS4) | $[2]$ | Punch dust full sensor/in (PS5) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Punch motor sensor (PS3) | $[4]$ | Punch drive motor (M1) |
| $[5]$ | Punch position sensor (PS2) | $[6]$ | Punch home sensor (PS1) |

### 1.15 SD-511 (Option)

| $[1]$ | Alignment motor (M3) | $[2]$ | SD transport motor (M1) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper discharge control motor (M2) | $[4]$ | Center fold guide motor (M8) |
| $[5]$ | Tri-folding guide motor (M6) | $[6]$ | SD paddle motor (M7) |
| $[7]$ | Stopper solenoid (SD1) | $[8]$ | Stopper drive motor (M4) |
| $[9]$ | Center fold knife motor (M9) | $[10]$ | Center fold roller motor (M5) |

| $[1]$ | SD entrance sensor (PS1) | $[2]$ | Center staple/fold stacker paper detect sensor (PS3) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Curl cover detection sensor (PS2) | $[4]$ | Alignment home sensor (PS4) |
| $[5]$ | Tri-folding gate home sensor (PS11) | $[6]$ | Guide home sensor (PS7) |
| $[7]$ | Paddle home sensor (PS5) | $[8]$ | Stopper home sensor (PS6) |
| $[9]$ | Booklet tray empty detection sensor/out (PS14) | $[10]$ | Fold exit sensor (PS12) |
| $[11]$ | Booklet tray empty detection sensor/in (PS13) | $[12]$ | Center fold knife home sensor (PS8) |
| $[13]$ | SD drive board (SDDB) | - | - |

### 1.16 FS-533 (Option)

| $[1]$ | Paper conveyance motor (M101) | $[2]$ | Stapler movement motor (M107) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Alignment roller motor (M103) | $[4]$ | Paper exit motor (M102) |
| $[5]$ | Exit roller lift up motor (M104) | $[6]$ | Paper exit roller solenoid (SD103) |
| $[7]$ | Alignment motor/F (M105) | $[8]$ | Alignment motor/R (M106) |
| $[9]$ | Paper surface detect solenoid (SD101) | $[10]$ | Tray lift up motor (M109) |
| $[11]$ | Batch solenoid (SD102) | - | - |

| $[1]$ | Paper feed sensor (PS101) | $[2]$ | Alignment plate home sensor/F (PS108) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Pick up roller position sensor (PS105) | $[4]$ | Stapler relay board (STREYB) |
| $[5]$ | Stapler home sensor (PS110) | $[6]$ | Finisher lock switch (SW1) |
| $[7]$ | Paper exit tray home sensor (PS107) | $[8]$ | Paper surface detect sensor/2 (PS104) |
| $[9]$ | Paper weight lever sensor (PS103) | $[10]$ | Paper surface detect sensor/1 (PS102) |
| $[11]$ | Alignment plate home sensor/R (PS109) | $[12]$ | FS control board (FSCB) |

### 1.17 PK-519 (Option)

| $[1]$ | Punch motor (M201) | $[2]$ | Paper feed sensor (PS201) |
| :--- | :--- | :--- | :--- |
| $[3]$ | PK control board (PKCB) | $[4]$ | Punch dust full sensor (PS205) |
| $[5]$ | Puncher drive cam sensor (PS203) | $[6]$ | Puncher home sensor (PS204) |
| $[7]$ | Punch motor sensor (PS202) | - | - |

### 1.18 FS-537/FS-537SD (Option)

| $[1]$ | Sub tray discharge motor (M18) | $[2]$ | Route change gate motor (M4) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Stapler movement motor (M19) | $[4]$ | FNS entry transport motor (M20) |
| $[5]$ | ZU discharge motor (M21) | $[6]$ | SD discharge motor (M16) |
| $[7]$ | Stapler motor (M5) | $[8]$ | Paper receiving control motor (M15) |
| $[9]$ | Main tray up/down motor (M6) | $[10]$ | Bundle eject motor (M1) |
| $[11]$ | Alignment motor/front (M14) | $[12]$ | Trail edge stopper motor/F (M12) |
| $[13]$ | Stacker plate drive motor (M3) | $[14]$ | Arm drive motor (M8) |
| $[15]$ | FNS paddle motor (M9) | $[16]$ | Pre-eject drive motor (M2) |
| $[17]$ | Trail edge stopper motor/R (M11) | $[18]$ | Paddle up/down motor (M7) |
| $[19]$ | Alignment motor/rear (M13) | $[20]$ | FNS discharge motor (M17) |
| $[21]$ | Receiving roller retraction motor (M10) | - | - |

- *1: Not used

| $[1]$ | 3rd exit tray full sensor (PS1) | $[2]$ | RU entrance sensor (PS2) |
| :--- | :--- | :--- | :--- |
| $[3]$ | RU cover open/close detection sensor (PS3) | $[4]$ | RU transport motor (M1) |

### 1.19 FS-537SD saddle section

| $[1]$ | SD control board (SDCB) | $[2]$ | Center fold roller motor (M5) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Center fold knife motor (M9) | $[4]$ | Stopper drive motor (M4) |
| $[5]$ | Stopper solenoid (SD1) | $[6]$ | SD paddle motor (M7) |
| $[7]$ | Center fold guide motor (M6) | $[8]$ | Tri-folding guide motor (M8) |
| $[9]$ | Paper discharge control motor (M2) | $[10]$ | Paper transport belt motor (M34) |
| $[11]$ | SD transport motor (M1) | $[12]$ | Alignment motor (M3) |

| $[1]$ | Center staple/fold stacker paper detect sensor (PS3) | $[2]$ | Fold exit sensor (PS12) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Center fold knife home sensor (PS8) | $[4]$ | Alignment home sensor (PS4) |
| $[5]$ | Stopper home sensor (PS6) | $[6]$ | Paddle home sensor (PS5) |
| $[7]$ | Guide home sensor (PS7) | $[8]$ | Tri-folding gate home sensor (PS11) |
| $[9]$ | SD exit full sensor (PS35) | $[10]$ | Curl cover detection sensor (PS2) |
| $[11]$ | SD exit tray limit sensor (PS41) | $[12]$ | SD exit tray lift sensor (PS43) |
| $[13]$ | SD entrance sensor (PS1) | - | - |

### 1.20 ZU-609 (Option)

| $[1]$ | Pressure motor (M502) | $[2]$ | Press home sensor (PS502) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Folding guide motor (M501) | $[4]$ | Guide home sensor (PS500) |
| $[5]$ | Chopper home sensor (PS501) | $[6]$ | ZU transport motor (M500) |
| $[7]$ | ZU drive board (ZUDB) | $[8]$ | Upper limit sensor4 (PS506) |
| $[9]$ | Upper limit sensor3 (PS505) | $[10]$ | Upper limit sensor2 (PS504) |
| $[11]$ | Upper limit sensor1 (PS503) | $[12]$ | ZU relay board (ZURB) |

### 1.21 PK-523 (Option)

| $[1]$ | Punch motor pulse sensor (PS306) | $[2]$ | Punch drive motor (M301) |
| :--- | :--- | :--- | :--- |
| $[3]$ | PK punch home sensor/1 (PS307) | $[4]$ | PK punch hole scraps box full sensor (PS302) |
| $[5]$ | Punch control board (PKCB) | $[6]$ | Paper size detect board (PSDTB) |
| $[7]$ | Punch oscillating motor (M302) | $[8]$ | PK punch oscillating home sensor (PS303) |
| $[9]$ | PK punch home sensor/2 (PS301) | - | - |

### 1.22 JS-602 (Option)

| $[1]$ | Entrance switching solenoid (SD401) | $[2]$ | Job tray paper exit sensor (PS402) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Job tray full sensor (PS403) | $[4]$ | Job tray door sensor (PS401) |

### 1.23 PI-507 (Option)

| $[1]$ | Registration clutch (CL203) | $[2]$ | Transfer clutch /Lw (CL202) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Tray lower limit sensor /Lw (PS210) | $[4]$ | Tray upper limit sensor /Lw (PS209) |
| $[5]$ | Pick-up solenoid /Lw (SD202) | $[6]$ | PI operation board (PIOB) |
| $[7]$ | Upper door open/close switch (MS205) | $[8]$ | Paper entrance sensor /Lw (PS206) |
| $[9]$ | Paper empty sensor /Lw (PS207) | $[10]$ | Paper size VR /Lw (VR202) |
| $[11]$ | Pl relay board (PIRB) | $[12]$ | Transport roller drive motor (M204) |
| $[13]$ | Chopper home sensor (PS501) | $[14]$ | L size sensor /Lw (PS212) |
| $[15]$ | Folding guide motor (M501) | $[16]$ | Paper set sensor /Lw (PS208) |
| $[17]$ | Tray lift motor /Lw (M202) | $[18]$ | Transfer motor (M203) |
| $[19]$ | PI drive board (PIDB) | - | - |

### 1.24 FS-536 (Option)

| $[1]$ | Main tray up/down motor (M11) | $[2]$ | FNS discharge motor (M3) |
| :--- | :--- | :--- | :--- |
| $[3]$ | FNS entry transport motor (M2) | $[4]$ | FNS paddle motor (M5) |
| $[5]$ | Receiving roller retraction motor (M4) | $[6]$ | Trailing edge stopper motor (M6) |
| $[7]$ | Alignment motor/front (M7) | $[8]$ | Bundle eject motor (M10) |
| $[9]$ | Pre-eject drive motor (M9) | $[10]$ | Paper receiving control motor (M12) |
| $[11]$ | Side stapler movement motor (M13) | $[12]$ | Alignment motor/rear (M8) |

| $[1]$ | Stacker motor sensor (PS25) | $[2]$ | Sub tray full detection sensor/out (PS9) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Main tray upper position detect switch (SW2) | $[4]$ | Pre-eject away sensor (PS22) |
| $[5]$ | Sub tray exit sensor (PS8) | $[6]$ | Main tray exit sensor (PS16) |
| $[7]$ | Pre-eject home sensor (PS21) | Trailing edge stopper home position detection sensor <br> (PS20) |  |
| $[9]$ | FNS entrance sensor (PS4) | $[10]$ | Upper door open/close detection sensor (PS32) |
| $[11]$ | Sub tray full detection sensor/in (PS10) | Exchange folded paper output sensor (PS30) |  |
| $[13]$ | Saddle exit sensor (PS5) | $[14]$ | Receiving roller retraction sensor (PS11) |
| $[15]$ | Upper paddle home position detection sensor (PS14) | Front door open detect switch (SW1) |  |
| $[17]$ | Alignment plate/F home sensor (PS12) | $[20]$ | Stapler position sensor (center) (PS24) |
| $[19]$ | Paper delivery control sensor (PS28) | $[24]$ | Main tray upper position sensor/F (PS27) |
| $[21]$ | Gripper motor sensor (PS17) | $[26]$ | Gripper position detection sensor (PS19) |
| $[23]$ | Main tray full detection sensor (PS29) | $[28]$ | Main tray upper position sensor/R (PS26) |
| $[25]$ | Staple stacker paper detection sensor (PS31) | $[30]$ | Alignment plate/R home sensor (PS13) |
| $[27]$ | Stapler home position sensor (rear) (PS23) | $[32]$ | FS control board (FSCB) |
| $[29]$ | Main tray upper sensor/out (PS6)*1 | - | - |
| $[31]$ | Gripper home position sensor (PS18) |  |  |
| $[33]$ | Wide Flat limit Sensor (PS36) |  |  |

- *1: Not used

| $[1]$ | 3rd exit tray full sensor (PS1) | $[2]$ | RU entrance sensor (PS2) |
| :--- | :--- | :--- | :--- |
| $[3]$ | RU cover open/close detection sensor (PS3) | $[4]$ | RU transport motor (M1) |

### 1.25 FS-536SD saddle section

| :--- | :--- | :--- | :--- |
| $[3]$ | Mirror unit | $[4]$ | LED exposure unit (LU201) |
| $[5]$ | Scanner drive cable/F | - | - |

### 2.3 Operation

### 2.3.1 LED exposure unit

## (1) bizhub C368/C308/C258

- LEDs (Light Emitting Diodes) are used for the light source of the scanner section for power saving.
- LEDs mounted on the LED board on one side (rear side) of the LED exposure unit emit light.
- Light emitted from the LED travels along the light guide.
- The original is exposed to uniform, stable light by direct light that is emitted from both light guides.

| $[1]$ | Light guide | $[2]$ | LED board |
| :--- | :--- | :--- | :--- |
| $[3]$ | Original | $[4]$ | Original glass |
| $[5]$ | Direct light | $[6]$ | Reflective mirror |

## (2) bizhub C658/C558/C458

- LEDs (Light Emitting Diodes) are used for the light source of the scanner section for power saving.
- Each LED board on either side has one LED, so that two LEDs illuminate.
- Light emitted from the LED travels along the light guide.
- The original is irradiated with direct light that has traveled along the light guide and indirect light reflected from the reflector, which ensures that the original is exposed to steady, uniform light.

| $[1]$ | Light guide | $[2]$ | Original glass |
| :--- | :--- | :--- | :--- |
| $[3]$ | Original | $[4]$ | Direct light |
| $[5]$ | Indirect light | $[6]$ | Reflector |
| $[7]$ | LED board | - | - |

### 2.3.2 When the power is ON

1. When the power is turned $O N$, the LED lights up.
2. The LED exposure unit moves to the home position.
3. The LED exposure unit moves from the home position to the shading position (under the shading correction sheet).
4. The gain value of the CCD sensor output voltage to $R, G$, and $B$ is adjusted.
5. After adjusting the gain value, a shading correction is performed.
6. The LED exposure unit moves in the return direction and stops at the home position.
7. When the DF is raised for placement of the original, the LED exposure unit moves to the original size detection position.

| $[1]$ | Original size detection position | $[2]$ | Shading position |
| :--- | :--- | :--- | :--- |
| $[3]$ | Home position | $[4]$ | LED exposure unit (LU201) |
| $[5]$ | Shading correction | $[6]$ | The LED turns ON |

### 2.3.3 Control when the Start key is pressed

## (1) Original scanning mode

- Original scanning mode has two types: Original cover mode and DF mode.
(a) Original cover mode

1. Turning the Start key $O N$ will turn the LED ON.
2. The LED exposure unit moves in the return direction and stops at the shading position. At the shading position, the gain adjustment is made.
3. The LED exposure unit moves in the return direction and stops at the scan start position.
4. To start a scan, the LED exposure unit moves from the scan start position to the leading edge of an original while performing shading correction.
The exposure unit will start reading the original image from the leading edge.
The unit will finish reading the image at the trailing edge of the original.
5. The LED will turn OFF when the reading is complete.
6. The LED exposure unit returns from the position of the trailing edge of the original. At the shading position, it is determined that the LED is turned OFF.
Then the LED exposure unit moves to the home position, and next moves to the original size detection position.
It scans only once even for the color-copies, since $R, G$, and $B$ data will all be memorized in one scanning.

| $[1]$ | Home position | $[2]$ | Scan start position |
| :--- | :--- | :--- | :--- |
| $[3]$ | Shading position | $[4]$ | Original size detection position |
| $[5]$ | Trailing edge of the image | $[6]$ | Gain adjustment |
| $[7]$ | Read original | $[8]$ | Return |
| $[9]$ | The LED turns ON | - | - |

(b) DF mode (DF-629: 1st side/2nd side, Dual scan document feeder/DF-704: 1 side)

- The original fed by the document feeder will be read at the DF original glass for. The LED exposure unit will move to the reading position and stops. The original will be read as the paper is transferred.

| $[1]$ | Shading position | $[2]$ | Home position |
| :--- | :--- | :--- | :--- |
| $[3]$ | Original reading position | $[4]$ | Shading correction |
| $[5]$ | Read original | $[6]$ | The LED turns ON |

## (2) Original scanning control

- The light reflected off the exposed original reaches the CCD sensor via the lens.
- The CCD sensor outputs an electric signal (analog) that varies according to the intensity of the light.
- One CCD sensor has a photo receiver that individually responds to each of the three primary colors of R, G, and B.
- The electric signal is converted to digital data for each of $R, G$, and $B$ by the CCD board (CCDB), becoming individual digital signals.
- Analog-to-digital conversion is made according to an instruction given by the MFP board (MFPB).

| $[1]$ | CCD sensor | $[2]$ | Scanning direction |
| :--- | :--- | :--- | :--- |
| $[3]$ | Sub scanning direction | $[4]$ | Main scanning direction |

(a) Calibration

The following adjustment and correction (calibration) are made before the original is scanned, so that the image of the original can be adequately read. For details, see " O.18.1 Scanner section image processing block diagram".

- Gain adjustment
- Shading correction

### 2.3.4 Original scanning area

- Original scanning areas vary depending on a scanning mode.

## (1) Original cover mode

- Main scanning direction: Max. 297.0 mm (11 11/16 inches)
- Sub scanning direction: Max. 431.8 mm (17 inches)
(2) DF mode
(a) Scanning at 400 dpi or less
- Main scanning direction: Max. 297.0 mm (11 11/16 inches)
- Sub scanning direction: Max. 1,000.0 mm (39 3/8 inches) (FAX mode only)
(b) Scanning at 600 dpi
- Main scanning direction: Max. 297.0 mm (11 11/16 inches)
- Sub scanning direction: Max. 432.0 mm (17 inches)

### 2.3.5 Original size detection control

(1) Detection method

- For the sub scanning (length) direction, the fixed reflective original size sensor (one beam) is used.
- For the main scanning (width) direction, the CCD is used
- A standard original size is determined by the state of the original size sensor, either the activated or deactivated state, and the width detected by the CCD
- For a custom size, the control sets a smallest possible standard size that is larger than the custom size in question to thereby prevent void image.

| $[1]$ | CCD unit | $[2]$ | Original size sensor2 (PS205) * |
| :--- | :--- | :--- | :--- |
| $[3]$ | Original size sensor1 (PS204) | $[4]$ | LED exposure unit (LU201) |

- *: Option

## (2) Original size judgment

## NOTE

- Table 1 or 2 can be selected in the service mode.

## (a) Criterion (Japan)

Table1

| Original size sensor1 <br> (PS204) | Main scanning width (mm) |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 0 to 130.0 | Up to | Up to | Up to | Up to |  |
|  |  | 153.0 | 187.0 | 215.0 | 262.0 | 262.1 or over |
| OFF | No original | A5S | B5S | A4S | B5 | A4 |

| OFF | ON | A3 | $81 / 2 \times 14$ | $81 / 2 \times 14$ | $81 / 2 \times 14$ | $81 / 2 \times 14$ | $81 / 2 \times 14$ | B4 | B4 | $11 \times 17$ | A3 |

(3) Detection timing

- The size in the sub scanning (length) direction is determined by the states of the original size sensors when the angle sensor is activated from the deactivated state.
- Detection is made twice for the main scanning (width) direction, one when the angle sensor is activated and the other when the original cover sensor is activated.
- The original size is reset when the original cover sensor is deactivated from activated state as a result of the DF being raised.

| $[1]$ | Angle sensor (PS202) | $[2]$ | Original size sensor1 (PS204) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Original cover sensor (RS201) | - | - |

### 2.3.6 Image processing

The bizhub 367 series image processing has uses the following processes. For details, see " O.18.1 Scanner section image processing block diagram".
(1) Scanner section image processing block diagram

- Photoelectric conversion
- Analog-to-digital conversion

3. WRITE SECTION (PH SECTION)

### 3.1 Configuration (bizhub C368/C308/C258)

| $[13]$ | Return mirror (Index) | $[14]$ | Index mirror |

### 3.3 Operation

### 3.3.1 Overview

- The surface of the photo conductor is irradiated with a laser light and an electrostatic latent image is thereby formed.
- The PH unit has a four color exposure unit single-piece configuration. A semiconductor laser is provided for each of four different colors. A single polygon motor is used to make a scan.
- The polygon mirror has seven faces.
- A rotating polygon mirror is irradiated with a laser light emitted from the laser diode on the laser drive board to let the laser light scan.
- bizhub C658/C558 models are equipped with a 2-beam-array laser diode. With two laser beams emitted from these two elements arranged vertically, two lines are scanned through a single face of the polygon mirror.
- bizhub C458/C368/C308/C258 models are equipped with a single-beam-array laser diode. Single line is scanned through a single face of the polygon mirror.
2-beam laser image view

| $[9]$ | G2 lens | $[10]$ | Return mirror2 |
| $[11]$ | Photo conductor | $[12]$ | Beam |

### 3.3.2 Laser exposure process

## (1) bizhub C368/C308/C258

1. The laser light of each color enters the cylindrical lens via the synthetic mirror and return mirror (light source).
2. At the cylindrical lens, each laser light is condensed in the vicinity of the polygon mirror.
3. Since the angle of incidence for each color of laser light varies, the laser light reflected by the polygon mirror is reflected in a different angle for each color.
4. The condensing angle of each color of laser light is corrected by the G1 and G2 lenses and then reaches each return mirror.
5. The K laser light is condensed on the photo conductor surface via the G 3 lens and return mirror1. The Y laser light is condensed on the photo conductor surface via the return mirror1, G3 lens, and return mirror2. The M laser light is condensed on the photo conductor surface via the return mirror1, G3 lens, and return mirror2. The C laser light is condensed on the photo conductor surface via the return mirror1, G3 lens, return mirror2, and return mirror3.

(2) bizhub C658/C558/C458
6. The laser light of each color enters the cylindrical lens via the synthetic mirror and return mirror (light source).
7. At the cylindrical lens, each laser light is condensed in the vicinity of the polygon mirror.
8. Since the angle of incidence for each color of laser light varies, the laser light reflected by the polygon mirror is reflected in a different angle for each color.
9. The condensing angle of each color of laser light is corrected by the G1 lens and then reaches each return mirror.
10. The K laser light is condensed on the photo conductor surface via the G 2 lens and return mirror1. The Y laser light is condensed on the photo conductor surface via the return mirror1, G2 lens, and return mirror2. The M laser light is condensed on the photo conductor surface via the return mirror1, G2 lens, and return mirror2. The C laser light is condensed on the photo conductor surface via the return mirror1, G2 lens, return mirror2, and return mirror3.

### 3.3.3 Laser emission timing

## (1) bizhub C368/C308/C258

- After a print cycle has been started, when the stable rotation signals of photo conductor and polygon motor are detected, a laser ON signal is output from the MFP board.
- The laser ON signal causes each laser diode to turn ON and emit a laser beam.
- The K laser light that is irradiated to the index board after it passes through the return mirror (light source), cylindrical lens, polygon mirror, G1 lens, G2 lens, index mirror, and index lens generates an index signal.
- This index signal has a function of keeping the same laser light emission timing per every one line in the main scanning direction.
- The index signal is generated with the K laser light only. The laser light emission timing for other colors is determined with reference to K
- If the index signal is not detected within a predetermined period of time, the machine determines that it is a laser emission fault, displaying "trouble code: C4501 laser malfunction".
- The machine continuously monitors the index signal. If the index signal cannot be detected at regular intervals, the machine determines that it is a laser emission fault, displaying "trouble code: C4501 laser malfunction"

| $[1]$ | Laser diode/K (LD/K) | $[2]$ | Laser diode/C (LD/C) |
| :--- | :--- | :--- | :--- |

| $[7]$ | Index board (INDEXB) | $[8]$ | Index lens |
| $[9]$ | G1 lens | $[10]$ | Polygon motor (M14) |

### 3.3.4 Laser emission stop

Emission of the laser beam is stopped if any of the following conditions is encountered during printing:

- End of a print job
- Laser emission of $Y, M$, and $C$ is stopped if the print mode is changed from color to black during printing
- The front door or any other door is opened.
- A misfeed occurs.
- A malfunction occurs.

### 3.3.5 Laser emission area

## (1) Main scanning direction

- The print start position in the main scanning direction is determined with the main scanning print start signal (HSYNC) that is output from the printer control board, and with the width of the paper.
- The laser emission area is determined by the paper size. However, the void image area is defined as both edges of the paper.

## (2) Sub scanning direction

- The print start position in the sub scanning direction is determined with the image write signal (VSYNC) that is output from the MFP board. Also, it is determined with the system speed.
- The laser emission area is determined by the paper size. However, the void image area is defined as both edges of the paper.

| Modes | Void image area |  |
| :--- | :--- | :--- |
|  | Main scanning direction | Sub scanning direction |
| Copy | $3 \mathrm{~mm}(1 / 8$ inches $)$ from the edge of the paper | $4.2 \mathrm{~mm}(3 / 16$ inches $)$ from the leading edge of the <br> paper |
|  | $3 \mathrm{~mm}(1 / 8$ inches $)$ from the edge of the paper | $3 \mathrm{~mm} \mathrm{(1/8} \mathrm{inches)} \mathrm{from} \mathrm{the} \mathrm{trailing} \mathrm{edge} \mathrm{of} \mathrm{the} \mathrm{paper}$ |
|  | $4.2 \mathrm{~mm}(3 / 16$ inches $)$ from the edge of the paper | $4.2 \mathrm{~mm} \mathrm{(3/16} \mathrm{inches)} \mathrm{from} \mathrm{the} \mathrm{leading} \mathrm{edge} \mathrm{of} \mathrm{the}$ <br> paper |
|  | $4.2 \mathrm{~mm}(3 / 16$ inches $)$ from the edge of the paper | $4.2 \mathrm{~mm} \mathrm{(3/16} \mathrm{inches)} \mathrm{from} \mathrm{the} \mathrm{trailing} \mathrm{edge} \mathrm{of} \mathrm{the} \mathrm{paper}$ |

### 3.3.6 Color registration control (color shift correction) system

## (1) Overview of the registration control

- In a tandem engine, each four different color has an independent image reproduction process. Color shift may occur because of variations in part accuracy. The color registration control system automatically detects color shift and correct color shift in the main and sub scanning directions.
- The color shift detection sequence proceeds as follows. A pattern each is produced at the front and rear on the transfer belt. Each of IDC sensors at the front and rear reads the corresponding pattern. The amount of color shift in each of the sub scanning and main scanning directions is then calculated and stored in memory.
- The amount of color shift in the sub scanning direction is read from the pattern falling within the sub scanning detection range. The amount of color shift in the main scanning direction is read from the pattern falling within the main scanning detection range.
- From data readings, the machine calculates how much the position of each of the different colors should be corrected. Based on the calculated data, the machine controls each dot during image output, thereby correcting the color shift amount.

[4]

| $[1]$ | Transfer belt | $[2]$ | Detection area for main scanning direction |
| :--- | :--- | :--- | :--- |
| $[3]$ | Detection area for sub scanning direction | $[4]$ | Movement direction of the transfer belt |

| [1] IDC sensor/Rr (IDCS/Rr) | [2] $\quad$ IDC sensor/Fr (IDCS/Fr) |
| :--- | :--- | :--- |

## (2) Types of color shift

- Color shift is misalignment of the images of three different colors, yellow ( Y ), magenta ( M ), and cyan (C), with respect to the image of black (K).
- Four different types of color shift can occur: color shift in the main scan direction, color shift due to overall scaling error in the main scan direction, color shift in the sub scan direction, and image skew.
(3) Correction of color shift in the main scan direction
- If the image of each color ( $\mathrm{Y}, \mathrm{M}, \mathrm{C}$ ) is misaligned with respect to the image of black $(\mathrm{K})$ in the main scan direction, changing the write start timing in the main scan direction can correct the color shift. Color shift correction needs to be performed separately for the respective colors (Y, M, C).
- Color shift correction control is activated when the image stabilization sequence is started.
* When the image of magenta is misaligned with respect to the image of black $(\mathrm{K})$ in the sub scan direction

| $[1]$ | Rotational direction of the transfer belt | $[2]$ | Transfer belt |
| :--- | :--- | :--- | :--- |
| $[3]$ | Before correction | $[4]$ | Color shift |
| $[5]$ | Magenta $(\mathrm{M})$ | $[6]$ | Black (K) |
| $[7]$ | After correction | $[8]$ | No color shift |

## Correction of color shift due to overall scaling error in the main scan direction

- If the image of each color ( $\mathrm{Y}, \mathrm{M}, \mathrm{C}$ ) and the image of black $(\mathrm{K})$ vary in length in the main scan direction, changing the clock frequency of the laser diode can correct the length difference in the main scan direction. Color shift correction needs to be performed separately for the respective colors (Y, M, C).
- Color shift correction control is activated when the image stabilization sequence is started.
* When the image of magenta is longer than the image of black (K)

| $[1]$ | Rotational direction of the transfer belt | $[2]$ | Transfer belt |
| :--- | :--- | :--- | :--- |
| $[3]$ | Before correction | $[4]$ | Magenta (M) |
| $[5]$ | Black $(\mathrm{K})$ | $[6]$ | Color shift |
| $[7]$ | After correction | $[8]$ | No color shift |

## (5) Correction of color shift in the sub scan direction

- If the image of each color ( $\mathrm{Y}, \mathrm{M}, \mathrm{C}$ ) is misaligned with respect to the image of black $(\mathrm{K})$ in the sub scan direction, changing the write start timing in the sub scan direction can correct the color shift. Color shift correction needs to be performed separately for the respective colors (Y, M, C).
- Color shift correction control is activated when the image stabilization sequence is started.
* When the image of magenta is misaligned with respect to the image of black $(\mathrm{K})$ in the sub scan direction

| $[1]$ | Rotational direction of the transfer belt | $[2]$ | Transfer belt |
| :--- | :--- | :--- | :--- |
| $[3]$ | Before correction | $[4]$ | Black (K) |
| $[5]$ | Color shift | $[6]$ | Magenta (M) |
| $[7]$ | After correction | $[8]$ | No color shift |

## (6) Skew (image skew)

- If the image of each color ( $\mathrm{Y}, \mathrm{M}, \mathrm{C}$ ) is tilted against the image of black $(\mathrm{K})$ in the sub scanning direction, the image skew can be corrected by tilting the G3 lens of the print head unit. Image skew correction needs to be performed separately for the respective colors (Y, M, C).
- Image skew is adjusted at timing when the image stabilization sequence is started.
* When the image of magenta is tilted against the image of black (K)

| $[1]$ | Rotational direction of the transfer belt | $[2]$ | Transfer belt |
| :--- | :--- | :--- | :--- |
| $[3]$ | Before correction | $[4]$ | Black (K) |

| $[5]$ | Color shift | $[6]$ | Magenta (M) |
| :--- | :--- | :--- | :--- |
| $[7]$ | After correction | $[8]$ | No color shift |

### 3.3.7 Color skew correction control

## (1) bizhub C368/C308/C258

- Temperature may change inside the print head unit and the components can change over time. These phenomena may cause color skew problems. To prevent the problems, individual G3 lenses that correspond to $\mathrm{Y}, \mathrm{M}$, and C respectively have a color skew auto adjustment mechanism.
- When the skew correction motor runs, the G3 lenses move up and down to perform an automatic color skew correction.

[1] G3 lens [2]
[2] Skew correction motor

| $[1]$ | G3 lens tilting shaft | $[2]$ | G3 lens: The lens is tilted to correct color skew. |
| :--- | :--- | :--- | :--- |
| $[3]$ | Skew correction motor | $[4]$ | Drive gear |
| $[5]$ | G3 lens drive cam | - | - |

## (2) bizhub C658/C558/C458

- Temperature may change inside the PH unit and the components can change over time. These phenomena may cause color skew problems. To prevent the problems, individual G 2 lenses that correspond to $\mathrm{Y}, \mathrm{M}$, and C respectively have a color skew auto adjustment mechanism.
- When the skew correction motor runs, the G2 lenses move up and down to perform an automatic color skew correction.

| $[1] ~ G 2 ~ l e n s ~$ | [2] Skew correction motor |
| :--- | :--- | :--- |

| $[1]$ | G2 lens tilting shaft | $[2]$ | G2 lens: The lens is tilted to correct color skew. |
| :--- | :--- | :--- | :--- |
| $[3]$ | Skew correction motor | $[4]$ | Drive gear |
| $[5]$ | G2 lens drive cam | - | - |

## (3) Skew adjustment method

- The following describe the direction in which the beam moves by the skew correction motors.
- When the skew correction motors rotates, the G3 lens moves in the direction of the arrow that is illustrated below, so that the beam moves.
- Only cyan uses a greater number of turnover mirrors, one more than yellow or magenta does, which results in the direction in which the beam moves being different from that of yellow and magenta

Skew adjustment direction: Direction in which the beam moves when the skew correction motor/Y, M, C rotates clockwise

(4) Skew correction motor adjustment value panel display

| [1] | Select [Service Mode] -> [Machine] -> [Print Head Skew Adj.] and call [Adjust Value] (default adjustment value unique to the print head) to the screen, in steps. | [2] | Shows the skew correction value after the image stabilization process, in steps. |
| :---: | :---: | :---: | :---: |
| [3] | Shows the skew correction value after the image stabilization process relative to that of the last image stabilization process, in steps. | - | - |

## (5) Operation timing

- The color registration control (color shift correction) and the color skew correction control operate at one time.
- The adjustment is performed based on the skew amount values for each color that are calculated from the detected sub scanning registration pattern according to the previous correction value.

### 3.3.8 Skew adjustment/skew adjustment reset

- There are cases where the "color skew correction control" cannot be executed for some reason. The machine provides functions that allow you to reset the "skew adjustment data" against these situations.
- For details of the Service Mode, see " I.5.4.9 Print Head Skew Adj.".

## (1) Possible conditions and causes

- The PH unit has been replaced with a new one.
- The alarm code "P-14: skew correction trouble" is displayed.
- A door is opened or the main power switch is turned OFF during color skew correction control, causing the skew correction sequence to be halted; as a result, the current position of the skew correction motor is unknown.
- The backup position information of the skew adjustment motor settings in the machine is lost operations such as replacement of the eMMC board.

### 3.3.9 PH unit temperature detection control

- The temperature inside the PH unit is measured at intervals of 30 sec . by the PH temperature sensor mounted in the PH unit.
- The detected temperature data is recorded to form part of the environmental information data and used for controlling, for example, color registration, 1st transfer output determination, and transfer roller cleaning.

### 3.3.10 PH window cleaning

- The PH window, if contaminated, blocks the path of the laser beam and the surface of the photo conductor can no longer be exposed properly. This could result in image problems, including white bands or white lines on the print image.
- The PH window is provided with a cleaning guide that prevents any image problem caused by a dirty PH window from occurring.

The following illustration is for bizhub C368/C308/C258.

[1] PH window cleaning tool

## (1) PH window cleaning procedures

- Slowly pull to the front the PH window cleaning tool and push it back into the original position. This allows the cleaning material mounted on the PH window cleaning tool to remove any foreign matter from the surface of the PH window.
- The machine is not equipped with any mechanism that automatically cleans the PH window. This makes it necessary to clean the PH window manually at regular intervals.
(2) PH window cleaning timing
- Clean the PH window of each color when the drum unit/K is replaced with a new one.

### 3.3.11 Image processing

The following image processing procedures relating to the write section are available. For details, see " O.18.2 Write section image processing block diagram".
(1) Write section image processing block diagram

- Resolution conversion processing in the main scanning direction/movement processing
- Resolution conversion processing in the sub scanning direction
- Main scanning position correction Speed conversion Modulation

## 4. PHOTO CONDUCTOR SECTION

### 4.1 Configuration

| $[1]$ | Drum unit | $[2]$ | Transfer belt |
| :--- | :--- | :--- | :--- |
| $[3]$ | Photo conductor | $[4]$ | Erase LED |
| $[5]$ | Toner collecting screw | $[6]$ | Cleaning blade |

| $[3]$ | PC motor (M2) | $[4]$ | Color PC drive gear/C |
| $[5]$ | Transport motor (M1) | $[6]$ | PC drive gear/K |
| $[7]$ | Drum unit/K | $[8]$ | Drum unit/C |
| $[9]$ | Drum unit/M | $[10]$ | Drum unit/Y |

### 4.2 Drive

The following illustration is for bizhub C368/C308/C258.

| $[1]$ | PC motor (M2) | $[2]$ | Transport motor (M1) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Photo conductor/K | $[4]$ | Photo conductor/C |
| $[5]$ | Photo conductor/M | $[6]$ | Photo conductor/Y |

### 4.3 Operation

### 4.3.1 Photo conductor drive mechanism

- Two independent photo conductor motors (for color and black) are used for the drive mechanism to suppress incorrect color registration and uneven pitch.

## (1) Photo conductor/K drive mechanism

- The transport motor drives the photo conductor/K.
- The transport motor is the common source that provides drive to manual bypass feed, tray feed, registration roller, transfer belt, and others.
- Drive is transmitted to the photo conductor when the triangular-prism-shaped shaft is engaged with the mating coupling part.

The following illustration is for bizhub C368/C308/C258.

| $[1]$ | Photo conductor/K | $[2]$ | Photo conductor drive gear/K |
| :--- | :--- | :--- | :--- |
| $[3]$ | Transport motor $(\mathrm{M} 1)$ | $[4]$ | Coupling |

The following illustration is for bizhub C368/C308/C258.

| $[1]$ | Photo conductor drive gear/K | $[2]$ | Transfer belt drive gear |
| :--- | :--- | :--- | :--- |
| $[3]$ | Registration roller drive gear | $[4]$ | Developing unit drive gear |

## (2) Photo conductor/Y, M, C drive mechanism

- The photo conductors/Y, M, C are driven by the PC motor.
- Drive is transmitted to each of the photo conductors when the triangular-prism-shaped shaft is engaged with the mating coupling part

The following illustration is for bizhub C368/C308/C258.

| $[1]$ | Color photo conductor drive gear/Y | $[2]$ | PC motor (M2) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Photo conductor/C | $[4]$ | Photo conductor/M |
| $[5]$ | Photo conductor/Y | $[6]$ | Coupling |

The following illustration is for bizhub C368/C308/C258.

| $[1]$ | Triangular-prism-shaped coupling part | $[2]$ | PC motor (M2) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Color photo conductor drive gear/C | $[4]$ | Color photo conductor drive gear/M |
| $[5]$ | Color photo conductor drive gear/Y | - | - |

### 4.3.2 Erase LED control

- The potential remaining in the photo conductor is removed when the erase LED turns on.
- The neutralization of any residual potential on the photo conductor helps improve cleaning performance of toner left on the surface of the photo conductor.

| $[1]$ | Transfer belt | $[2]$ | Erase LED |
| :--- | :--- | :--- | :--- |
| $[3]$ | Photo conductor | - | - |

## (1) Erase LED ON timing

- The erase LED is turned ON when the photo conductor starts rotating

## (2) Erase LED OFF timing

- The erase LED is turned OFF after the lapse of a predetermined period of time after the corona charge output has been shut down. (That is, the erase lamp is turned OFF after all charge left on the surface of the photo conductor is neutralized.)

### 4.3.3 Photo conductor cleaning

- Part of the toner image that is not transferred is left on the surface of the photo conductor. The residual toner is scraped off by the cleaning blade.
- Toner, which has been scraped off the surface of the photo conductor, is conveyed by the toner collecting screw toward to the front of the machine. It is discharged in the waste toner box.

| $[1]$ | Transfer belt | $[2]$ | Waste toner |
| :--- | :--- | :--- | :--- |
| $[3]$ | Toner collecting screw | $[4]$ | Cleaning blade |
| $[5]$ | Photo conductor | - | - |

## (1) Cleaning blade

- The cleaning blade is pressed up against the surface of the photo conductor at all times. No cleaning blade retraction mechanism is provided.
- The cleaning blade scrapes residual toner off the surface of the photo conductor as the photo conductor is rotated.
(2) Toner conveyance/collection mechanism
- The toner collecting screw is rotated by the driving force transmitted from the photo conductor. (The toner collecting screw rotates in time with the rotation of the photo conductor.)
- Rotation of the toner collecting screw conveys toner scraped off the surface of the photo conductor toward the front of the machine.
- The toner conveyed to the front of the machine is discharged via the toner collecting port into the waste toner box.
- The toner collecting port is provided with a shutter mechanism. Mounting the waste toner box pushes the shutter at the toner collecting port, opening the toner collecting port. The shutter is closed by the waste toner box removal and prevents the toner spilling from the toner collecting port

### 4.3.4 Electrostatic charger control

- A charging roller is used in the electrostatic charger.
- The charging roller does not apply high voltages in comparison to a comb electrode and generates no ozone, so that no ozone filter is mounted.

| $[1]$ | Comb electrode charge | $[2]$ | Roller charging |
| :--- | :--- | :--- | :--- |
| $[3]$ | Comb electrode | $[4]$ | Charging roller |

(1) Charge application start timing

- Charge is applied to the electrostatic charger application terminal when the photo conductor (transport motor and PC motor) drive motor starts rotating at a steady speed.

## (2) Charge application end timing

- Application of the charge to the electrostatic charger application terminal is terminated when the surface of the photo conductor which faces the transfer belt as the 1st transfer output is turned OFF moves past the charging position.

| C1] Charging roller | [2] | Electrostatic charger application terminal |
| :--- | :--- | :--- | :--- |

### 4.3.5 Charging roller cleaning

- If the charging roller becomes contaminated, the surface of the photo conductor can no longer be charged uniformly, so that uneven charge occurs. Uneven charge of the photo conductor results in irregular streaks or other print image defects.
- The cleaning roller rotates by following the rotation of the charging roller, continuously cleaning contamination from the charging roller surface.

| $[1]$ | Photo conductor | $[2]$ |
| :--- | :--- | :--- |
| $[3]$ | Cleaning roller | - |

### 4.3.6 Drum unit detection

The drum unit of each color of toner is provided with a DC set board. The board detects set of the corresponding drum unit.

| $[1]$ | Drum unit | [2] |
| :--- | :--- | :--- |

## NOTE

- For the life of the unit, refer to F.6.1 Consumable/part replacement time (bizhub C368/C308/C258) and F.6.2 Consumable/part replacement time (bizhub C658/C558/C458).

## (1) Unit mounting detection

(a) Detection timing

- The unit mounting detection control is performed under any of the following conditions
"The power switch is turned ON (with the front door and right door are closed)"
"The front door or right door is opened and closed with the power switch in ON position"
(b) Operation when it is detected that no units are mounted
- The message "Drum Unit Installation Error" appears on the control panel and the machine prohibits initiation of any new print cycle. The message "Drum Unit Installation Error" disappears as soon as a drum unit is mounted

## (2) New article detection

(a) Detection timing

- The new article detection control is performed if it is determined through the "unit mounting detection" control that the drum unit is correctly mounted in place.
(b) Operation when the drum unit is determined not to be new
- The new article detection control is terminated.
(c) Operation when the drum unit is determined to be new
- The life counter of the drum unit is reset to zero and the control proceeds to the life detection control.
- The result of the new article detection is recorded in the eMMC board of the main body.
- The life counter is available for the drum unit of each color. The counter value is recorded in the eMMC board of the main body.

## (3) New release disable mode

- No new article detection control is performed for the drum unit when the new article detection-disabled mode is used.
- The new article detection-disabled mode should be used only for troubleshooting purposes

## NOTE

" See " 1.7.3.9 Engine FW DipSW" for more detailed operating precautions.

## 5. DEVELOPING SECTION

### 5.1 Configuration

| $[1]$ | Developing unit | $[2]$ | Doctor blade |
| :--- | :--- | :--- | :--- |
| $[3]$ | Photo conductor | $[4]$ | TCR sensor |
| $[5]$ | Toner supply screw 1 | $[6]$ | Toner supply screw 2 |
| $[7]$ | Developing roller | - | - |

| $[1]$ | Doctor blade | $[2]$ | Developing roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Toner supply screw 2 | $[4]$ | TCR sensor |
| $[5]$ | Toner supply screw 1 | - | - |

### 5.2 Drive

### 5.2.1 Developing section/K drive mechanism

- Drive force from the transport motor is transmitted to each gears so that the developing roller/K is driven. The following illustration is for bizhub C368/C308/C258.

| $[3]$ | Transport motor (M1) | [4] | Developing roller/K |
| :--- | :--- | :--- | :--- |

### 5.2.2 Developing section/Y, M, C drive mechanism

- Rotation of the developing motor transmits drive to the developing drive gear $\mathrm{Y}, \mathrm{M}, \mathrm{C}$, which drives each of the developing rollers.

The following illustration is for bizhub C368/C308/C258.

| $[1]$ | Developing roller/Y | $[2]$ | Developing drive gear/Y |
| :--- | :--- | :--- | :--- |
| $[3]$ | Developing drive gear/M | $[4]$ | Developing motor (M21) |
| $[5]$ | Developing drive gear/C | $[6]$ | Developing roller/C |
| $[7]$ | Developing roller/M | - | - |

### 5.3 Operation

### 5.3.1 Developing unit pressure/releases mechanism

- A mechanism is provided that releases the developing unit from the PC drum to prevent the photo conductor from being damaged when the drum unit is to be removed.
- Rotating the release lever clockwise will cause the rib fixed to the lever to fit into the groove in the developing unit, so that the developing unit is pressed against the drum unit
- Rotating the release lever counterclockwise will cause the rib fixed to the lever to leave the groove in the developing unit, so that the developing unit is released from the drum unit

| $[1]$ | Photo conductor | $[2]$ | Rib |
| :--- | :--- | :--- | :--- |
| $[3]$ | Release lever | $[4]$ | Groove |

### 5.3.2 Developer flow

1. Toner replenished via the toner replenishing port located at the front side of the main body is fed to the toner supply screw 1 .
2. The developer is conveyed toward the rear of the unit, while being agitated and electrically charged, by the toner supply screw 1 .
3. The TCR sensor is equipped on the underside of the developing unit detects toner to carrier (T/C) ratio during this time. If the T/C ratio is lower than a predetermined value, toner is replenished.
4. The developer, fed to the rear of the developing unit, is conveyed further onto the toner supply screw 2.
5. The developer fed to the toner supply screw 2 is conveyed onto the developing roller because of the magnetic pole positioning of the developing roller.
6. The doctor blade then controls the height of the developer brush to ensure that the developer on the developing roller levels out.
7. Only the toner contained in the developer sticks to the electrostatic latent image on the surface of the photo conductor. The developer that is left on the developing roller is returned to the toner supply screw 2 by the magnetic pole positioning of the developing roller.
8. The part of the circulating developer is collected in the waste toner box through the toner collecting port located at the front side of the toner supply screw 2 . The toner collecting port is provided with a shutter mechanism. Mounting the waste toner box pushes the shutter at the toner collecting port, opening the toner collecting port. Removing the waste toner box, on the other hand, closes the shutter and toner is thereby prevented from spilling from the toner collecting port. (For more details, see Auto refining developing system and Waste toner spillage prevention shutter.)

## NOTE

- The toner replenishing port of the developing unit is not provided with a shutter mechanism. (The toner hopper section is equipped with a shutter.)
- When removing the developing unit, the developing unit must be held in a horizontal position with care not to allow toner to spil from the toner replenishing port.

| $[1]$ | Toner supply screw 2 | $[2]$ | Developing roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Toner replenishing port | $[4]$ | Toner supply screw 1 |
| $[5]$ | TCR sensor | - | - |

### 5.3.3 Auto refining developing system

- The developing unit/Y,M,C,K incorporates the auto refining developing system.
- The bottle of toner cartridge is packed with both toner and carrier and the developing unit is replenished with fresh carrier at the same time that it is replenished with toner.
- Excess carrier in the developing unit is discharged, thereby inhibiting carrier left in the developing unit from being deteriorated and maintaining stable image quality for an extended period of time.

| $[1]$ | Toner bottle | $[2]$ | Toner |
| :--- | :--- | :--- | :--- |
| $[3]$ | New carrier | $[4]$ | Low degree of deterioration of entire carrier |
| $[5]$ | Circulation and agitation | $[6]$ | Developing unit |
| $[7]$ | Waste toner box | - | - |

### 5.3.4 Developing bias

- The developing bias voltage ( Vdc ) is applied to the developing roller so that an adequate amount of toner is attracted onto the surface of the photo conductor
- In addition to the negative DC component, AC voltage is applied during development to help toner to be attracted more easily to the surface of the photo conductor. This AC component is applied only while development is taking place. At any other timing, only the DC (-) Vdc is applied.
- The developing bias $(\mathrm{Vdc})$ is supplied from high voltage unit.
- The developing bias voltage supplied from the high voltage unit is applied to the developing roller of each color of toner via the metal shaft of the developing drive gear.
- See "IMAGE FORMING CONTROL" for the timing to apply the bias voltage.

| $[1]$ | Developing bias voltage application terminal/Y | $[2]$ | Developing bias voltage application terminal/M |
| :--- | :--- | :--- | :--- |
| $[3]$ | Developing bias voltage application terminal/C | $[4]$ | Developing bias voltage application terminal/K |
| $[5]$ | Developing roller/K | $[6]$ | Developing roller/C |
| $[7]$ | Developing roller/M | $[8]$ | Developing roller/Y |

## (1) Service Mode

(a) Grad/Dev AC Bias V Selection

- The "Grad/Dev AC Bias V" can be changed by changing the setting of "Imaging Process Adjustment/ Grad/Dev AC Bias V Selection" of the Service Mode. This provides development performance that responds to various types of environment of the users.
- Turning ON the "Grad/Dev AC Bias V Selection" allows the "Grad/Dev AC Bias V" to be decreased down to a voltage value lower than the ordinary specified value.
- With the ordinary specified value set for the "Grad/Dev AC Bias V" in low atmospheric pressure environments, such as at high altitudes, leak could occur, resulting in white dots. Leak, and thus white dots on the image, can be prevented from occurring by lowering the "Grad/Dev AC Bias V".
- For details of the Service Mode, see " I.5.6.13 Grad/Dev AC Bias V Selection."

### 5.3.5 Toner scattering prevention

- The toner scattering prevention plate and toner scattering prevention sheet are equipped in an area around the developing roller, functioning to prevent toner from scattering.

| $[1]$ | Toner scattering prevention plate | $[2]$ | Developing roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Toner scattering prevention sheet | - | - |

### 5.3.6 Developing cooling

- The transfer belt cleaner cooling fan is provided to circulate air through the inside of the machine, so that the areas around the developing unit, drum unit, toner hopper, and the transfer belt unit can be cooled.
- See "FAN CONTROL" for air path and detailed information

### 5.3.7 Toner density control

- The TCR sensor is mounted on the underside of each of the developing sections. The TCR sensor for $\mathrm{C}, \mathrm{M}, \mathrm{Y}$ and K is a non-contact magnetic type. Each of these sensors detects toner-to-carrier ratio (TC) of the developer. The reading is used for determining the amount of toner supplied.
- Only when a new developing unit is installed in the machine, an automatic adjustment (calibration) is made of each of these TCR sensors. The automatic adjustment of TCR sensors cannot be done at your own discretion.
- The target TC ratio is $6.5 \pm 1.5 \%$.
- The magnetic permeability (powder density) of the carrier in the developer is measured to determine the TC ratio.
- The TCR sensor is integrated with the developing unit. When the TCR sensor is to be replaced with a new one, the entire developing unit must be replaced.
- For replenishment of toner to the developing unit, see " O.6.4.4 Auxiliary toner replenishing control for toner hopper".

[1] Toner supply screw $1 \quad$ [2] TCR sensor

| $[1] ~ T C R ~ s e n s o r ~$ | - | - |
| :--- | :--- | :--- |

### 5.3.8 Developing unit detection

- The developing unit of each color of toner is provided with a TCR sensor. The sensor detects different states of the corresponding developing unit.

## [1] TCR sensor

## NOTE

- For the life of the unit, refer to F.6.1 Consumable/part replacement time (bizhub C368/C308/C258) and F.6.2 Consumable/part replacement time (bizhub C658/C558/C458).
(1) Unit mounting detection
- The TCR sensor detects the mounting condition of the developing unit.
- When developing unit is detected in the mounted condition, control now proceeds to the "new article detection control".
(a) Detection timing
- The unit mounting detection control is performed under any of the following conditions:
"The power switch is turned ON (with the front door and right door are closed)"
"The front door or right door is opened and closed with the power switch in ON position"
(b) Operation when it is detected that no units are mounted
- The message "Developing Unit Installation Error" appears on the control panel and the machine prohibits initiation of any new print cycle. The message "Developing Unit Installation Error" disappears as soon as a developing unit is mounted.
(2) New article detection
- The TCR sensor detects whether the developing unit is new or not.
(a) Detection timing
- The new article detection control is performed if it is determined through the "unit mounting detection" control that the developing unit is correctly mounted in place.
(b) Operation when the developing unit is determined not to be new
- The new article detection control is terminated.
(c) Operation when the developing unit is determined to be new
- The TCR sensor automatic adjustment control (calibration) is performed.
- The image stabilization control is performed.
- The life counter of the developing unit is reset to zero.
- After the above controls are performed, the operation proceeds to the life detection control.
- The result of the new article detection is recorded in the eMMC board of the main body.
- The life counter is available for the developing unit of each color. The counter value is recorded in the eMMC board of the main body.
(3) New release disable mode
- The new article detection-disabled mode is used when a new developing unit is temporarily used for performing troubleshooting procedures of a machine.
- No new article detection control is performed for the developing unit when the new article detection-disabled mode is used.
- The new article detection-disabled mode should be used only for troubleshooting purposes.

NOTE
" See " I.7.3.9 Engine FW DipSW" for more detailed operating precautions.

## 6. TONER SUPPLY SECTION

### 6.1 Configuration (bizhub C368/C308/C258)

| $[1]$ | Toner cartridge/M | $[2]$ | Toner cartridge/Y |
| :--- | :--- | :--- | :--- |
| $[3]$ | Toner supply motor/Y (M9) | $[4]$ | Toner cartridge motor/Y,M,C (M10) |

| $[11]$ | Toner empty sensor/K (PS31) | $[12]$ | Toner empty sensor/C (PS32) |
| $[13]$ | Toner empty sensor/M (PS33) | $[14]$ | Toner empty sensor/Y (PS34) |

### 6.3 Drive

### 6.3.1 Toner cartridge drive (bizhub C368/C308/C258)

- The toner cartridge motor rotates to drive the toner cartridge. The interior of the toner cartridge is in spiral form. As the toner cartridge rotates, toner inside the toner cartridge is conveyed toward the toner replenishing port that is located at the front side. So that the toner hopper is replenished with the toner from the toner cartridge.
- The toner cartridge motor/Y,M,C drives the toner cartridge/Y,M,C; and the toner cartridge motor/K drives the toner cartridge/K. The toner cartridge drive is switched depending on the color and monochrome print applications.

| $[1]$ | Toner cartridge drive gear/Y | $[2]$ | Toner cartridge drive gear/M |
| :--- | :--- | :--- | :--- |
| $[3]$ | Toner cartridge motor/Y,M,C (M10) | $[4]$ | Toner cartridge motor/K (M25) |
| $[5]$ | Toner cartridge drive gear/K | $[6]$ | Toner cartridge drive gear/C |
| $[7]$ | Toner cartridge/K | $[8]$ | Toner cartridge/C |
| $[9]$ | Toner cartridge/M | $[10]$ | Toner cartridge/Y |

### 6.3.2 Toner cartridge drive (bizhub C658/C558/C458)

- The toner cartridge motor rotates to drive the toner cartridge. The interior of the toner cartridge is in spiral form. As the toner cartridge rotates, toner inside the toner cartridge is conveyed toward the toner replenishing port that is located at the front side. So that the toner hopper is replenished with the toner from the toner cartridge.
- The toner cartridge motor/Y,M drives the toner cartridge/Y,M; and the toner cartridge motor/C,K drives the toner cartridge/C,K. The toner cartridge drive is switched depending on the color and monochrome print applications.

| $[1]$ | Toner cartridge drive gear/Y | $[2]$ | Toner cartridge motor/Y,M $(\mathrm{M} 10)$ |
| :--- | :--- | :--- | :--- |
| $[3]$ | Toner cartridge drive gear/M | $[4]$ | Toner cartridge motor/C,K $(\mathrm{M} 25)$ |
| $[5]$ | Toner cartridge drive gear/K | $[6]$ | Toner cartridge drive gear/C |
| $[7]$ | Toner cartridge $/ \mathrm{K}$ | $[8]$ | Toner cartridge/C |
| $[9]$ | Toner cartridge/M | $[10]$ | Toner cartridge/Y |

### 6.3.3 Toner hopper drive

- Rotation of the toner supply motor causes the toner agitating blade and toner conveying screw inside the toner hopper to rotate.
- Toner conveyed into the toner hopper is agitated by the toner agitating blade.
- As the toner conveying screw rotates, toner is conveyed onto the toner replenishing port located at the front side inside the toner hopper, so that the toner is fed into the developing unit via the toner replenishing pipe.
The following illustration is for bizhub C368/C308/C258.

| $[1]$ | Toner supply motor/Y (M9) | $[2]$ | Toner supply motor/M (M8) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Toner supply motor/C (M7) | $[4]$ | Toner supply motor/K (M6) |
| $[5]$ | Toner conveying screw/K | $[6]$ | Toner agitating blade/K |
| $[7]$ | Toner conveying screw/C | $[8]$ | Toner agitating blade/C |
| $[9]$ | Toner conveying screw/M | $[10]$ | Toner agitating blade/M |
| $[11]$ | Toner conveying screw/Y | $[12]$ | Toner agitating blade/Y |

### 6.4 Operation

### 6.4.1 Toner replenishing overview

- The toner replenishing mechanism in this machine has a two-step replenishing structure. One is replenishing the toner hopper with the toner from the toner cartridge. The other one is replenishing the developing unit with the toner from the toner hopper.
- The toner cartridge incorporates the auto refining developing system for all colors.
- The interior of the toner cartridge is packed with both toner and carrier. The developing unit is replenished with fresh carrier at the same time of replenishing the toner. Excess carrier in the developing unit is discharged, thereby inhibiting carrier left in the developing unit from being deteriorated and maintaining stable image quality for an extended period of time.
- For details of the auto refining developing system, see " O.5.3.3 Auto refining developing system".

| $[1]$ | Toner cartridge | $[2]$ | Toner hopper |
| :--- | :--- | :--- | :--- |
| $[3]$ | Toner replenishing pipe | - | - |

### 6.4.2 Toner replenishing from toner bottle to toner hopper

(1) Toner replenishing mechanism

- The toner replenishing from the toner cartridge to the toner hopper is determined by unblocking and blocking the toner empty sensor.
- If the toner empty sensor is blocked a predetermined number of times, the machine determines that it is in a near empty condition. So that, the toner cartridge motor is energized and a toner replenishing sequence is started.
- The toner hopper for each color of toner is provided with a toner empty sensor.
- Each toner empty sensor is blocked or unblocked by an actuator dedicated to it. The detection plate is moved up and down by a cam that is mounted coaxially with the toner agitating blade. The actuator that is mounted on the detection plate is operatively associated with the up-and-down movement that is detected using the toner empty sensor.

| $[1]$ | Toner hopper | $[2]$ | Detection plate |
| :--- | :--- | :--- | :--- |
| $[3]$ | Toner empty sensor/K (PS31) | $[4]$ | Toner empty sensor/C (PS32) |
| $[5]$ | Actuator | $[6]$ | Toner empty sensor/M (PS33) |
| $[7]$ | Toner empty sensor/Y (PS34) | - | - |

## (2) Toner replenishing control

- The toner replenishing control is started when the drive of the toner cartridge motor is started.
- The output of the toner empty sensor is monitored for a predetermined period of time. If the toner empty sensor is turned ON from the OFF state, during the predetermined period of time, the machine determines that the "toner hopper runs out of toner (or there is only a small amount of toner left in the toner hopper)" and increments the near empty counter by one. Next, the toner cartridge motor is rotated for a predetermined period of time, so that toner is supplied from the toner cartridge to the toner hopper.
- If the toner empty sensor remains OFF, the machine determines that "toner is still available for use in the toner hopper", resetting the near empty counter to zero.
- These operations are repeated. When the near empty counter reaches the predetermined value, the machine determines that the toner hopper is in the near empty condition.

| $[1]$ | Toner empty sensor: OFF | $[2]$ | Toner |
| :--- | :--- | :--- | :--- |
| $[3]$ | Toner empty sensor: ON | - | - |

### 6.4.3 Toner replenishing from toner hopper to developing unit

## (1) Toner replenishing control

- Control of replenishing the developing unit with toner from the toner hopper is performed only when the developing unit is driven.
- The toner replenishing time (the amount of toner supplied) during the toner replenishing control is determined based on the T/C ratio detected by the TCR sensor (noncontact magnetic type) disposed at the developing unit for each color of toner and the amount of toner to be consumed (estimated) for the image to be printed.
- If replenishing is interrupted by a paper misfeed, the front door opened or closed, or any similar event, the required replenishing time is carried forward to the next replenishing control sequence.
- For details of the TCR sensor, see " O.5.3.7 Toner density control"

## (2) Toner replenishing mechanism

- Four toner supply motors drive the toner conveying screws and the toner agitating blades provided in the toner hoppers of four different colors of toner
- The toner supply motor of each color drives the toner conveying screw and the toner agitating blade.
- The toner agitating blade rotates to agitate toner in the toner hopper.
- The toner conveying screw rotates to replenish the developing unit with toner.

| $[1]$ | Drive from toner supply motor/Y | $[2]$ | Drive from toner supply motor/M |
| :--- | :--- | :--- | :--- |
| $[3]$ | Drive from toner supply motor/C | $[4]$ | Toner supply motor/K (M6) |
| $[5]$ | Toner conveying screw/K | $[6]$ | Toner agitating blade/K |
| $[7]$ | Toner conveying screw/C | $[8]$ | Toner agitating blade/C |
| $[9]$ | Toner conveying screw/M | $[10]$ | Toner agitating blade/M |
| $[11]$ | Toner conveying screw/Y | $[12]$ | Toner agitating blade/Y |

## (3) Toner agitating blade drive

1. Toner conveying screw is rotated by the driving of the toner supply motor.
2. The rotation of the toner conveying screw is transmitted to the toner agitating blade drive gear, which results in the toner agitating blade being rotated. The toner agitating blade rotates to agitate toner in the toner hopper.
3. The cam mounted coaxially with the toner agitating blade moves the detection plate and actuator up and down.
*: For details of the toner empty sensor, see " O.6.4.9 Toner empty detection control".

| $[1]$ | Detection plate | $[2]$ | Toner agitating blade |
| :--- | :--- | :--- | :--- |
| $[3]$ | Toner conveying screw | $[4]$ | Cam (operatively connected to toner agitating blade <br> shaft |
| $[5]$ | Actuator | $[6]$ | Toner empty sensor |

### 6.4.4 Auxiliary toner replenishing control for toner hopper

- If the amount of toner in the toner hopper is likely decreasing, control is performed to supply toner forcibly from the toner cartridge to the toner hopper.
- The machine prohibits initiation of any new print cycle while the auxiliary toner replenishing control is being executed.

## (1) Toner hopper auxiliary toner replenishing control execution timing

- Rotate the toner cartridge motor for a predetermined time to supply toner from the toner cartridge to the toner hopper under one of the following conditions:
"The toner replenishing menu is performed from the Service Mode"
"The toner cartridge is replaced with a new one after a toner empty condition is detected in the toner cartridge (toner empty reset control is performed)"
"The developing unit is replaced with a new one (developing unit new article detection control is performed)"
"The toner replenishing menu is manually performed from the Service Mode"

## (2) Toner hopper auxiliary toner replenishing control end timing

- The auxiliary toner replenishing control is terminated under any of the following conditions:
"A predetermined period of time elapses after the toner cartridge motor has been energized"
"The front door is opened and closed"
"An error or malfunction occurs"
"The machine enters the power save or sleep mode"

### 6.4.5 Auxiliary toner replenishing control for developing unit

- If the T/C ratio detected by the TCR sensor is equal to, or lower than, a predetermined value at the start of a print cycle, initiation of the print cycle is prohibited and the developing unit is replenished with toner from the toner hopper until the T/C value reaches the predetermined value. (for a period of about 5 min . maximum)
- The auxiliary toner replenishing control for developing unit is terminated as soon as the predetermined T/C ratio is recovered. It is also terminated if the auxiliary toner replenishing control for developing unit is repeated ten sets. Also, it will be terminated when a toner empty condition is detected in the toner cartridge.

## (1) Operation flow

- When the auxiliary toner replenishing control is performed, the following operations will also be performed. Agitate the toner hopper, calculate the T/C ration with the TCR sensor for each color, and replenish toner from toner cartridge to the toner hopper are performed.
- The auxiliary toner replenishing control is performed for a maximum of about 5 min .

- *1: If a predetermined T/C is not reached, return to replenishing control. (a maximum of 10 times)
- *2: Agitate developing unit during replenishing
- *3: Agitate developing unit after replenishing

### 6.4.6 Toner spillage prevention shutter

## (1) Toner cartridge

(a) Mounting

- The shutter of the toner replenishing port is opened when the handle of the toner cartridge is rotated clockwise to the toner replenishing position after the toner cartridge has been inserted into the toner cartridge mounting portion.
- The toner cartridge motor rotates to drive the toner cartridge.
- As the toner cartridge rotates, toner inside the toner cartridge is conveyed toward the toner replenishing port, so that the toner hopper is replenished with toner.
(b) Removal
- The shutter at the toner replenishing port must be closed when the toner cartridge is to be removed
- Rotating the handle of the toner cartridge counterclockwise to the cartridge removal position closes the shutter of the toner replenishing port. The toner cartridge can be removed when the toner replenishing port of the toner cartridge is closed.

| $[1]$ | Toner cartridge positioning protrusion | $[2]$ | Toner cartridge toner spillage prevention shutter |
| :--- | :--- | :--- | :--- |
| $[3]$ | Toner hopper toner spillage prevention shutter | - | - |

| [1] $\quad$ Toner cartridge positioning protrusion | [2]Toner cartridge toner replenishing port (toner cartridge <br> removal position) |
| :--- | :--- | :--- |

## (2) Toner hopper

- The toner replenishing port of the toner hopper of each color of toner is provided with a toner spillage prevention shutter that prevents toner from spilling during removal or reinstallation of the developing unit.
- Mounting the developing unit pushes the shutter at the toner replenishing port, opening the toner replenishing port. Removing the developing unit, on the other hand, closes the shutter and toner is thereby prevented from spilling from the toner replenishing port.

| $[1]$ | Toner replenishing port | [2] | Toner hopper toner spillage prevention shutter (opened: <br> toner replenishing position) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Toner hopper toner spillage prevention shutter (closed: <br> developing unit removal position) | - | - |

### 6.4.7 Toner supply PPM control

NOTE

- This control is available in bizhub C658/C558 models only.
- The print speed is high during a consecutive printing of high-coverage original, and so toner may not be provided fast enough.
- To prevent insufficient supply of toner (density reduction), this control temporarily lengthens the interval during a consecutive printing at high coverage ratio to control the reduction of the toner density.
- This control will start when the coverage ratio exceeds approximately $80 \%$, and 15 sheets has been printed consecutively.
- When the control starts, printing with an efficiency equivalent to bizhub C458 model is executed
- Efficiency returns to normal after toner density is restored.

### 6.4.8 Front door mechanism

- The main power switch and total counter are mounted inside the front door.

## (1) Front door locking mechanism

- The front door is provided with a locking mechanism.
(a) Unlocking the front door
- Pulling the front door to the front will release the door lock magnets (two) provided at the upper portion of the front door.
(b) Locking the front door
- Close the front door. When the front door is closed in its correct position, the door lock magnets (two) provided at the upper portion of the front door lock the front door in place.
- The front door is provided with a protrusion that detects the correct mounting of the toner cartridge. It prevents operation of the machine, when the toner replenishing shutter of the toner cartridge is closed.

## (2) Front door open/close detection mechanism

- The front door switch detects that the front door is opened or closed.
- When the front door is closed, the open/close detection protrusion provided at the upper portion on the left side of the front door presses the actuator of the front door switch. This turns ON the front door switch and the machine determines that the front door is closed.
- When the front door is opened, the front door switch actuator is released, which turns OFF the front door switch. The machine then determines that the front door is open and shows a message that prompts the operator to close the front door.
When it is determined that the front door is open, use of all jobs but the fax reception job is prohibited. In addition, a paper misfeed results if the front door is opened during a print job.

| $[3]$ | Front door switch (SW2) | $[4]$ | Front upper door sensor (PS43) |

Example: bizhub C368/C308/C258

### 6.4.9 Toner empty detection control <br> NOTE

- For the life of the toner cartridge, refer to F.6.1 Consumable/part replacement time (bizhub C368/C308/C258) and F.6.2 Consumable/part replacement time (bizhub C658/C558/C458).
(1) Toner near empty detection
- The toner empty sensor provided for the toner hopper of each color of toner is used to determine the amount of toner still available for use in the toner hopper.
- The cam that is mounted coaxially with the detection plate moves up and down depending on the remaining amount of the toner. Thus, the toner empty sensor detects the condition.
- If the near empty counter exceeds 3 during control of replenishing the toner hopper with toner, a toner near empty condition is considered. As a result, it prompts to perform the toner empty control.
- For details of the toner replenishing control, see " O.6.4.2 Toner replenishing from toner bottle to toner hopper".

| $[1]$ | Detection plate | $[2]$ | Toner agitating blade |
| :--- | :--- | :--- | :--- |
| $[3]$ | Toner conveying screw | $[4]$ | Cam (operatively connected to toner agitating blade <br> shaft |
| $[5]$ | Actuator | $[6]$ | Toner empty sensor |

(a) Toner near empty detection timing

- The toner replenishing control is started when the drive of the toner supply motor is started.
- The output of the toner empty sensor is monitored for a predetermined period of time. If the toner empty sensor is turned ON from the OFF state, during the predetermined period of time, the machine determines that the "toner hopper runs out of toner (or there is only a small amount of toner left in the toner hopper)" and increments the near empty counter by one.
- If the toner empty sensor remains OFF, the machine determines that "toner is still available for use in the toner hopper", resetting the near empty counter to zero.
- These operations are repeated. When the near empty counter reaches the predetermined value, the machine determines that the toner hopper is in the near empty condition. Then, it shows the message "Toner is low. Replace when indicated" on the control panel.

## (2) Resetting the toner near empty and toner empty conditions

- Either the "auxiliary toner replenishing control for toner hopper" or "auxiliary toner replenishing control for developing unit" is performed (both may be performed in some cases) after a toner near empty condition and a toner empty condition have been detected.
- The toner near empty/empty display is reset when the control is normally terminated.
- Initiation of a new print cycle is prohibited during execution of the "auxiliary toner replenishing control for toner hopper" and "auxiliary toner replenishing control for developing unit".
- See the relevant pages for more details of the "Auxiliary toner replenishing control for toner hopper" and "Auxiliary toner replenishing control for developing unit".

List of controls

| Control name |  | Parts to be controlled |  | Description |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Auxiliary toner replenishing control for developing unit |  | Developing unit |  | Recovers the T/C ratio of the developer in the developing unit. |  |
| Auxiliary toner replenishing control for toner hopper |  | Toner hopper |  | Recovers the amount of toner in the toner hopper. |  |
| Condition | Toner in unit |  |  | Control to be executed | Printing after the end of the control |
|  | Developing unit |  | Toner hopper |  |  |
| Near empty | Available |  | Decreasing | Auxiliary toner replenishing control for toner hopper | Empty display is reset if the amount of toner in the toner hopper is recovered. |
| Empty 1 | Available |  | Not available |  | Empty display stays put if the amount of toner in the toner hopper is not recovered. |
| Empty 2 | Not available |  | Not available | Auxiliary toner replenishing control for toner hopper + auxiliary toner replenishing control for developing unit | Empty display is reset if the T/C ratio is recovered. |
|  |  |  | Empty display stays put if the T/C ratio is not recovered. |  |  |

(a) Toner empty condition resetting timing

- The "auxiliary toner replenishing control for toner hopper" or "auxiliary toner replenishing control for developing unit" is executed under any of the following conditions after a toner near empty/toner empty condition has been detected:
"The main power switch is turned ON"
"Release in sub power off mode"
"The front door is opened and closed" (bizhub C368/C308/C258)
"The lower front door is opened and closed" (bizhub C658/C558/C458)

### 6.4.10 Toner cartridge detection

- Toner cartridges contain the toner cartridge set board to detect new toner cartridges.

| $[1]$ | toner cartridge set board/Y $(T C S B / Y)$ | $[2]$ | toner cartridge set board/M (TCSB/M) |
| :--- | :--- | :--- | :--- |
| $[3]$ | toner cartridge set board/C $(T C S B / C)$ | $[4]$ | toner cartridge set board/K (TCSB/K) |

## NOTE

- For details of the toner cartridge life, see " F.6.1 Consumable/part replacement time (bizhub C368/C308/C258)", " F.6.2 Consumable/part replacement time (bizhub C658/C558/C458)".

## (1) Description

- The toner cartridge detection is controlled by means of accessing the toner cartridge set board when the upper front door is closed or the sub power switch is turned ON to determine whether the toner cartridge is loaded or not.
- After detecting the presence of the cartridge, the machine determines whether the cartridge is new or not.

## 7. 1ST TRANSFER SECTION

### 7.1 Configuration

## NOTE

- bizhub C658/C558/C458 transfer belt units and bizhub C368/C308/C258 transfer belt units have different cleaning blades. Make sure to use the transfer belt dedicated to your machine.
- To replace the transfer belt unit with a new one, confirm the model of machine at first. Then make sure to use the transfer belt unit dedicated to your machine.

| $[1]$ | Cleaning blade | $[2]$ | Transfer belt |
| :--- | :--- | :--- | :--- |
| $[3]$ | 1st transfer roller pressure mechanism | $[4]$ | 1st transfer roller pressure cam |
| $[5]$ | Separation claw | $[6]$ | 1st transfer roller/K |
| $[7]$ | 1st transfer roller/C | $[8]$ | 1st transfer roller/M |
| $[9]$ | 1st transfer roller/Y | - | - |

### 7.2 Drive

The following illustration is for bizhub C368/C308/C258.

| $[1]$ | Transfer belt driven roller | $[2]$ | 1st transfer pressure clutch (CL5) |

| $[5] \quad$ Transfer belt drive roller | - | - |
| :--- | :--- | :--- |

### 7.3 Operation

### 7.3.1 Transfer belt drive

- The transfer belt drive roller is rotated by the driving force of the transport motor
- Rotation of the transfer belt causes the transfer belt driven roller to rotate. The drive transmission gear located at the transfer belt driven roller rotates the waste toner conveying screw of the cleaning mechanism.
The following illustration is for bizhub C368/C308/C258.

| $[1]$ | Waste toner conveying screw | $[2]$ | Transfer belt driven roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Transfer belt | $[4]$ | Transport motor (M1) |
| $[5]$ | Transfer belt drive roller | - | - |

### 7.3.2 1st transfer roller control

- Pressure mechanism is equipped for pressing the 1st transfer rollers (Y, M, C) to inside the transfer belt at the 1st transfer.
- The 1st transfer roller (K) does not have pressure retraction mechanism. The 1st transfer roller (K) always presses the transfer belt to the PC drum (K).
- The driving force of the fusing motor is transmitted to the fusing drive release gear and transfer belt retraction clutch, thereby pressing the 1 st transfer roller. The fusing drive release gear is moved to the drive coupling position when the right door is closed, so that the driving force can be transmitted. For more details of the fusing drive release mechanism, see " O.13.3.1 Fusing drive release mechanism".
(1) 1st transfer roller pressure
- Rotation of the fusing motor is transmitted to the transfer belt retraction clutch via the fusing drive release gear.
- When the 1st transfer pressure clutch is turned ON, the rotation of the fusing motor is transmitted to the drive gear.
- Rotation of the drive gear rotates the pressure cam, so that the position of contact between the slide plate and the cam is varied.
- The 1st transfer roller pressure spring provided for the slide plate causes the slide plate to move to the pressure position. (Toward the transfer belt driven roller side.)
- The movement of the slide plate results in the 1st transfer roller drive arm being rotated. The rotation of the 1st transfer roller drive arm lowers the 1 st transfer roller ( $\mathrm{Y}, \mathrm{M}, \mathrm{C}$ ), so that the transfer belt is pressed against the PC drum.
- When the slide plate moves to the pressure position, the leading edge of the slide plate pushes the actuator of the 1st transfer pressure sensor.
- The actuator blocks the 1st transfer pressure sensor and the slide plate movement is detected.
- The 1st transfer pressure clutch is turned OFF.
- The cam will stop rotating and the siding plate will stop.
- The 1st transfer roller (Y, M, and C) will stay being pressed.

The following illustration is for bizhub C368/C308/C258.

| :--- | :--- | :--- | :--- |
| $[3]$ | Actuator | - | - |

### 7.3.3 Pressure/retraction control by print mode

- To extend the service life of the PC drum/Y, M, C, the transfer belt is retracted from the color PC drum in the black mode.
- In the black mode, the 1st transfer roller/Y, M, C is retracted and the color drum unit and color developing unit are stopped.
- The 1 st transfer roller/K is pressed against the PC drum/K at all times in both black and color modes.

## (1) Color mode

- In the color mode, the 1st transfer roller is where the PC drum is pressed against the transfer belt for all four colors of toner.

## (2) Black mode

- In the black mode, the 1st transfer roller/Y, M, C is where the PC drum/Y, M, C leaves the transfer belt, while the 1st transfer roller/K is where the PC drum $/ \mathrm{K}$ is pressed against the transfer belt. This allows the PC drum $/ \mathrm{Y}, \mathrm{M}, \mathrm{C}$ to stop rotating in this mode.
Color mode

| $[1]$ | Transfer belt | $[2]$ | 1st transfer roller/M |
| :--- | :--- | :--- | :--- |
| $[3]$ | 1st transfer roller/C | $[4]$ | 1st transfer roller/K |
| $[5]$ | Photo conductor/K | $[6]$ | Photo conductor/C |

| $[9]$ | 1st transfer roller/Y | - | - |

Black mode

| $[1]$ | Transfer belt (retraction position) | - |
| :--- | :--- | :--- |

(3) ACS mode
(a) ACS mode overview

- When making a copy, any desired copy mode can be selected from the control panel. (The default setting is the "auto color mode".) The auto color mode is called the ACS (auto color selection) mode. (In PC print job, auto color as the setting item in the printer driver corresponds to the ACS.)
- In ACS mode, the machine analyzes the image data of the original scanned by the "scanner section" to determine whether the image data is colored or in black.
- Determining that it is a color original, the machine presses the 1st transfer roller and runs a color print job.
- Determining that it is a black original, the machine retracts the 1 st transfer roller and runs a black print job.
(b) Control of 1st transfer roller in ACS mode
- The number of sheets of continuous series of black originals is counted when color originals are changed to black originals.
- Pressure of the 1 st transfer roller is controlled according to the number of sheets of continuous series of black originals during a multiprint cycle, thereby achieving both high print productivity and extended service life of consumables.
- "Control of 1st transfer roller in ACS mode" is executed only when a copy is made with "Auto Color" selected from the control panel. It is not executed when "Full Color", "Black", "2 Color", or "Single Color" is selected.
- The control is executed, for "PC print", only if the print cycle is run with "Auto Color" selected from the printer driver screen. It is not executed when "Full Color" or "Grayscale" is selected.
- The 1st transfer roller /Y,M,C is in the pressed position (color mode) in its initial state.

NOTE

- The control of 1st transfer roller in the ACS mode is enabled only after the number of sheets of continuous series of black originals has been counted. It is therefore not an effective control for a copy print job involving only one copy set/stack. The control is effectively operable for the following print jobs: Since on the first copy, the control can be performed only for where the original is read and counted.
"Copy print of the second copy set/stack and onward"
"Copy print from a registered job"
"PC print job"
(c) When the number of multi-copies is as specified or under
- ACS control starts counting the number of multi-copies of the black original when switched from the color original to the black original.
- The black printing will start with color mode. (with the 1st transfer roller/Y,M,C being pressed) Developing or transfer does not take place with the developing unit ( $\mathrm{Y}, \mathrm{M}, \mathrm{C}$ ), but, since the transfer belt is pressed, the PC drum and the developing roller are rotated as the transfer belt rotates. An advantage during pressure the 1 st transfer roller /Y, $M, C$ is that the loss time related to print productivity that generates due to retraction of the 1st transfer roller can be reduced.
(d) When the number of multi-copies is as specified or over
- The black printing will start when the color mode is complete and the 1 st transfer roller $/ \mathrm{Y}, \mathrm{M}, \mathrm{C}$ is retracted to be switched to the black mode. An advantage during retraction of the 1st transfer roller is that chance of the developing unit ( $Y, M, C$ ) and drum unit ( $Y, M, C$ ) being worn as a result of wasteful rotation can be reduced.
When printing in black with color mode (effecting black printing with the four PC drums rotating)

| $[1]$ | Color mode | $[2]$ | Color mode |
| :--- | :--- | :--- | :--- |
| $[3]$ | Color mode | - | - |

Printing after switched to black mode
[1]
$\rightarrow \quad[2]$
2] $\rightarrow$
[3]

| $[1]$ | Color mode | $[2]$ | Black mode |
| :--- | :--- | :--- | :--- |
| $[3]$ | Black mode | - | - |

(e) Black original specified values

- Number of multiple black originals during plain paper printing

| Paper length | Black printing in color mode | Black printing after switched to black mode |
| :---: | :---: | :---: |
| 216 mm or less | 4 sheets or less | 5 sheets or more |
| Over 216 mm and up to 297 mm | 2 sheets or less | 3 sheets or more |
| Over 297 mm and up to 381 mm | 2 sheets or less | 3 sheets or more |
| Over 381 mm and up to 432 mm | 2 sheets or less | 3 sheets or more |
| Over 432 mm and up to 457 mm | 2 sheets or less | 3 sheets or more |
| Over 457 mm | Switched to black mode |  |

(4) ACS mode control change with the Engine FW DipSW

- By changing the Engine FW DipSW "25" setting from "OFF (default) " to "ON", you can change the pressure control of the 1st transfer rollers on the ACS mode.
- When "OFF" is selected, productivity has the priority and printing is conducted with the transfer belt being pressed onto the color photo conductors even when the specified quantity of black printing is included.
- When "ON" is selected, black printing quantity threshold until switching to K press (release of color photo conductors) becomes smaller.
- This setting is to be used when the degradation control of the color photo conductors should have priority over printing productivity.

### 7.3.4 1st transfer control

- To transfer the toner image formed on the surface of the PC drum onto the transfer belt, the transfer current supplied from the high voltage unit is applied to the 1st transfer roller of each color

| $[1]$ | 1st transfer current application terminal/Y | $[2]$ | 1st transfer current application terminal/M |
| :--- | :--- | :--- | :--- |
| $[3]$ | 1st transfer current application terminal/C | $[4]$ | 1st transfer current application terminal/K |
| $[5]$ | 1st transfer roller/K | $[6]$ | 1st transfer roller/C |
| $[7]$ | 1st transfer roller/M | $[8]$ | 1st transfer roller/Y |

### 7.3.5 Transfer belt cleaning

- The toner image on the surface of the transfer belt is transferred onto the paper. (2nd transfer)
- Part of the toner image is left on the surface of the transfer belt after the 2nd transfer. A cleaning blade is provided on the transfer belt. It functions to remove the residual toner (waste toner).

| $[1]$ | Drive transmission gear | $[2]$ | Transfer belt |
| :--- | :--- | :--- | :--- |
| $[3]$ | Transfer belt driven roller | $[4]$ | Caking-of-toner prevention blade |
| $[5]$ | Cleaning blade | $[6]$ | Toner collecting screw |

| $[1]$ | Toner collecting screw | $[2]$ | Transfer belt |
| :--- | :--- | :--- | :--- |
| $[3]$ | Transfer belt driven roller | $[4]$ | Transfer belt rotative direction (forward rotation) |
| $[5]$ | Cleaning blade | - | - |

## (1) Cleaning blade

- The cleaning blade, of a fixed blade type, is pressed up against the surface of the transfer belt at all times. No cleaning blade retraction mechanism is provided.
- The waste toner on the surface of the transfer belt is scraped off as the transfer belt is rotated.
(2) Waste toner conveying/collecting mechanism
- Drive for the toner collecting screw comes from the transfer belt driven roller. (The toner collecting screw rotates in time with rotation of the transfer belt.)
- The rotation of the toner collecting screw conveys waste toner scraped off the surface of the transfer belt toward the front of the machine.
- There is a caking-of-toner prevention blade installed. It prevents waste toner from caking at the toner collecting screw portion.
- The waste toner is discharged through the toner collecting port into the waste toner box.
- The waste toner is disposed of when a waste toner box which is detected to be full of waste toner is replaced with a new one and the used waste toner box is discarded.

| $[1]$ | Drive connecting gear | $[2]$ | Transfer belt |
| :--- | :--- | :--- | :--- |
| $[3]$ | Transfer belt driven roller | $[4]$ | Toner collecting screw |

| $[1]$ | Toner collecting screw | $[2]$ | Drive connecting gear |
| :--- | :--- | :--- | :--- |
| $[3]$ | Transfer belt driven roller | $[4]$ | Transfer belt |

### 7.3.6 Waste toner spillage prevention shutter

- The toner collecting port is provided with a waste toner spillage prevention shutter that prevents waste toner from spilling during removal or reinstallation of the waste toner box.
- Mounting the waste toner box pushes the shutter at the toner collecting port, opening the toner collecting port. The shutter is closed by the waste toner box removal and prevents the toner spilling from the toner collecting port.

| $[1]$ | Toner collecting screw | $[2]$ | Toner collecting port |
| :--- | :--- | :--- | :--- |
| $[3]$ | Shutter | - | - |

[1]

| $[1]$ | Toner collecting screw | [2] | Shutter (open) |
| :--- | :--- | :--- | :--- |

### 7.3.7 Cleaning blade foreign matter removal control

- The transfer belt is rotated backward to a small extent and then rotated forward to remove foreign matter (dust, toner, etc.) wedged between the transfer belt and the edge of the cleaning blade.
(1) Operation timing
- The backward rotation control is provided at the completion of every print job.

| $[1]$ | Toner collecting screw | $[2]$ | Backward rotation |
| :--- | :--- | :--- | :--- |
| $[3]$ | Transfer belt | $[4]$ | Transfer belt driven roller |
| $[5]$ | Forward rotation | $[6]$ | Cleaning blade |

### 7.3.8 Transfer belt new article detection

- The transfer belt unit is not provided with any new article detection mechanism. If the transfer belt is replaced with a new one, therefore, "New Release" must be performed in [Counter] -> [Life] of the Service Mode. For detailed operating procedures, see "I.5.17.2 Life".

| Counte | er/Data /Life | END |

## 8. 2ND TRANSFER SECTION

### 8.1 Configuration

| $[1]$ | 2nd transfer roller | $[2]$ | Fusing loop sensor (PS2) |
| :--- | :--- | :--- | :--- |
| $[3]$ | IDC sensor/Fr (IDCS/Fr) | $[4]$ | IDC sensor shutter solenoid (SD2) |
| $[5]$ | Temperature/humidity sensor (TEM/HUMS) | $[6]$ | IDC sensor/Rr (IDCS/Rr) |

| $[1]$ | Separation claw | $[2]$ | Charge neutralizing needle |
| :--- | :--- | :--- | :--- |
| $[3]$ | 2nd transfer roller | $[4]$ | 2nd transfer roller lock release lever |
| $[5]$ | Transfer belt | - | - |

### 8.2 Drive

The following illustration is for bizhub C368/C308/C258.

| $[1]$ | Transfer belt | $[2]$ | Transport motor (M1) |
| :--- | :--- | :--- | :--- |
| $[3]$ | 2nd transfer roller | - | - |

### 8.3 Operation

### 8.3.1 2nd transfer control

- To transfer the toner image formed on the transfer belt onto the paper, the 2nd transfer voltage supplied from the high voltage unit is applied to the 2nd transfer roller.
- Resistance of the 2nd transfer roller changes with an environmental change, durability, and other factors. To maintain an optimum output voltage, fixed current is passed through the 2 nd transfer roller and the voltage being outputted at that time is detected. An appropriate $2 n d$ transfer voltage is determined based on the measured voltage and other information such as "type of paper used", "temperature and humidity", "color mode or black mode", and "1-sided/2-sided".

| $[1]$ | 2nd transfer roller | $[2]$ | 2nd transfer voltage conductive plate |
| :--- | :--- | :--- | :--- |
| $[3]$ | 2nd transfer voltage application terminal | - | - |

## (1) Execution timing

- The 2nd transfer control is executed when a print job is received under any of the following conditions:
"Main power switch is turned ON"
"Power key is pushed"
"The machine exits the sleep mode"
"The threshold value of a change in machine interior temperature is exceeded."
(2) 2nd transfer control during image stabilization control
- In this machine, the 2nd transfer roller does not have a retraction mechanism, so that the transfer belt and 2nd transfer roller are pressed up against each other at all times.
- During image stabilization control, a toner image for adjustment purpose is formed on the surface of the transfer belt. A negative voltage is therefore applied to the 2 nd transfer roller during image stabilization control. The amount of toner sticking to the 2 nd transfer roller is thereby reduced.

### 8.3.2 Control of toner application to 2nd transfer roller

- In this machine, the 2nd transfer roller does not have a retraction mechanism, so that the transfer belt and 2nd transfer roller are pressed up against each other at all times.
- If a new 2nd transfer roller that has replaced an old one is left to stand idle for a long period of time, a substance contained in the new roller sticks to the surface of the transfer belt, which could result in noise in the print image.
- To prevent the substance contained in the 2nd transfer roller from sticking to the transfer belt, $Y$ toner is applied to the surface of a new $2 n d$ transfer roller at the time of replacement. (The $Y$ toner image that corresponds to two complete revolutions of the transfer roller is formed on the surface of the transfer belt and is then transfer red onto the surface of the 2nd transfer roller.)
- The $Y$ toner that is less noticeable is used for the toner to be applied, in consideration of back marking

## (1) Execution timing

- The control is executed when the life counter of the 2nd transfer roller in the service mode is reset to zero

### 8.3.3 2nd transfer roller cleaning

- In order to remove the remaining toner on the 2nd transfer roller, -/+ (DC) charge is applied alternately to transfer the remaining toner on the 2 nd transfer roller to the transfer belt. (The number of times that electrical charge is applied to the 2nd transfer roller is different depending on each situation.)
- The cleaning blade then scrapes off the toner on the surface of the transfer belt.

| $[1]$ | Transfer belt | $[2]$ | 2nd transfer roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Cleaning blade | - | - |

### 8.3.4 Charge neutralization and separation of paper

- To neutralize any residual potential on the paper which has undergone the 2nd transfer process, there is a charge neutralizing needle mounted on the guide plate after the 2nd transfer roller. There is a resin guide that prevents the electrode from directly contacting the paper.
- The residual potential neutralized by the charge neutralizing needle is grounded via a conductive plate.
- In order to separate the paper from the transfer belt without fail after the 2nd transfer, a separation claw is mounted (center one point.)

| $[1]$ | Transfer belt | $[2]$ | Paper winding prevention guide |
| :--- | :--- | :--- | :--- |
| $[3]$ | Separation claw | $[4]$ | Charge neutralizing needle |
| $[5]$ | 2nd transfer roller | - | - |

### 8.3.5 Paper winding prevention guide

- The paper winding prevention guide prevents paper from being wound around the transfer belt again after its being separated from the transfer belt by the separation claw.

| $[1]$ | Transfer belt | $[2]$ | Paper winding prevention guide |
| :--- | :--- | :--- | :--- |
| $[3]$ | Separation claw | $[4]$ | Charge neutralizing needle |
| $[5]$ | 2nd transfer roller | - | - |

| $[1]$ | Transfer belt |
| :--- | :--- |
| $[2] \quad$ Paper winding prevention guide |  |

### 8.3.6 IDC sensor protection

- The IDC sensor can be contaminated with toner since it is located under the transfer belt. There is a shutter mechanism provided for the sensor to prevent it from being contaminated.
- The shutter is opened or closed by the IDC sensor shutter solenoid.

| IDC sensor shutter solenoid (SD2) | Shutter |
| :---: | :---: |
| OFF | Closed |
| ON | Open |

| $[1]$ | IDC sensor shutter (open position) | $[2]$ | IDC sensor/Fr (IDCS/Fr) |
| :--- | :--- | :--- | :--- |
| $[3]$ | IDC sensor shutter solenoid (SD2) | $[4]$ | Actuator for shutter |
| $[5]$ | IDC sensor/Rr (IDCS/Rr) | - | - |

| $[1]$ | IDC sensor shutter (close position) | $[2]$ | IDC sensor shutter solenoid: OFF |
| :--- | :--- | :--- | :--- |
| $[3]$ | IDC sensor shutter (open position) | $[4]$ | IDC sensor shutter solenoid: ON |

### 8.3.7 2nd transfer roller new article detection

- The 2nd transfer roller (hereinafter referred to as the "transfer roller") is not provided with any new article detection mechanism. If the transfer roller is replaced with a new one, therefore, "New Release" must be performed of the "Transfer Belt Unit" in [Counter] -> [Life] of the Service Mode. Performing "New Release" of the "Transfer Belt Unit" in life counter of the Service Mode will also reset the life counter of the transfer roller to zero.

NOTE

- For the life of the 2nd transfer roller, refer to F.6.1 Consumable/part replacement time (bizhub C368/C308/C258) and F.6.2 Consumable/part replacement time (bizhub C658/C558/C458).

## 9. TONER COLLECTING SECTION

### 9.1 Configuration

| $[1]$ | Toner collecting screw (Transfer belt section) | $[2]$ | Toner collecting screw (Drum unit/Y,M,C,K) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Toner collecting port (Drum unit/Y,M,C,K) | $[4]$ | Toner collecting screw (Waste toner box) |
| $[5]$ | Toner agitating blade | $[6]$ | Toner supply screw (Developing unit) |

### 9.2 Drive

The following illustration is for bizhub C368/C308/C258.

| $[1]$ | Transport motor (M1) | $[2]$ | Registration clutch (CL4) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Registration roller | $[4]$ | Waste toner box drive gear |
| $[5]$ | Waste toner box | - | - |

### 9.3 Operation

### 9.3.1 Waste toner box drive mechanism

- The waste toner box is driven by the transport motor.
- The driving force of the transport motor is transmitted to the registration roller via the registration clutch. The drive coupling gear mounted coaxially with the registration roller drives the waste toner box.
(1) Execution timing
- The waste toner box rotates in synchronism with the registration roller. For details on registration roller, see registration control section.

### 9.3.2 Control of waste toner conveyance through waste toner box

- Waste toner in the transfer belt unit and drum units, and excess toner in the developing unit are conveyed onto the waste toner box by the toner collecting screw.
- Waste toner and waste developer (waste carrier + waste toner) are collected through the toner collecting ports for the each units
- The waste toner collecting port is provided with a toner agitating blade that prevents toner from stagnating.
- The toner agitating blade is moved up and down as the toner collecting screw rotates. * The toner collecting port for the developing unit is not provided with any toner agitating blade.
- Toner collecting screw 1 and toner collecting screw 2 (dedicated to the transfer belt toner collecting port) are installed in the waste toner box.
- The screws provided on toner collecting screw 1 function to convey waste toner stagnant in the box uniformly onto the central portion of the box.
- Toner collecting screw 2 functions to convey toner conveyed from the transfer belt unit uniformly onto the central portion of the box.
- There is a detection window for detecting a waste toner full condition provided at the central portion of the box. When the waste toner conveyed onto the central portion of the box exceeds a predetermined height, waste toner spills over the waste toner full condition detection section. For details, see " O.9.3.4 Waste toner box full detection".

| $[1]$ | Toner agitating blade | [2] | Toner collecting screw 2 (dedicated to the transfer belt <br> toner collecting port) |

| :--- | :--- | :--- |

| $[1]$ | Waste toner full condition detection window | - |
| :--- | :--- | :--- |

### 9.3.3 Waste toner box-in-position detection

- The waste toner box set sensor provided on the front side board detects mounting condition of the waste toner box. It prevents the machine from being operated with the waste toner box yet to be mounted in place.
- When the waste toner box is removed, the waste toner box set sensor is unblocked, which causes the machine to determine that the waste toner box is yet to be mounted.
- The machine, on determining that the waste toner box is yet to be mounted in place, prohibits initiation of a new print cycle.
- When the waste toner box is mounted, the waste toner box set sensor is blocked, which causes the machine to determine that the waste toner box is mounted in place.
- The machine, on determining that the waste toner box is mounted in place, resets the waste toner box yet-to-be-mounted display, enabling initiation of a new print cycle.

| $[1]$ | Front side board (FRB) | $[2]$ | Waste toner box set sensor (PS100) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Waste toner full sensor (PS101) | - | - |

| $[1]$ | Waste toner box detection plate | - |
| :--- | :--- | :--- |

(1) Execution timing

The waste toner box detection control is performed under any of the following conditions:

- "The power switch is turned ON"
- "The front door or right door is closed"
(2) Waste toner box yet-to-be-mounted display

### 9.3.4 Waste toner box full detection

- The waste toner full sensor provided on the front side board is used to determine the amount of waste toner accumulated in the waste toner box.

## NOTE

- For the life of the waste toner box, refer to F.6.1 Consumable/part replacement time (bizhub C368/C308/C258) and F.6.2 Consumable/part replacement time (bizhub C658/C558/C458).

## (1) Waste toner near-full

- The toner collecting screw provided in the waste toner box conveys waste toner in the box onto the central portion of the box. For details, see " O.9.3.2 Control of waste toner conveyance through waste toner box".
- A detection window for detecting a waste toner full condition is equipped at the central portion of the waste toner box. When the waste toner conveyed onto the central portion of the box exceeds a predetermined height, waste toner spills over the waste toner full condition detection section.
- The machine determines that there is a waste toner near-full condition, if the waste toner full sensor is blocked by the waste toner stagnant over the waste toner full condition detection section for a predetermined period of time or longer.

## (a) Execution timing

The waste toner box near-full detection control is performed under any of the following conditions:

- "The machine determines that the waste toner box is mounted in place using the waste toner box set sensor."
- "During a print cycle"
- "During execution of image stabilization control"

| $[1]$ | Waste toner box | $[2]$ | Waste toner |
| :--- | :--- | :--- | :--- |
| $[3]$ | Waste toner | $[4]$ | Waste toner full condition detection window |

## (2) Waste toner full condition

- When a waste toner near-full condition is detected, the "waste toner full detection counter" is incremented according to the image density information of the print image during each of subsequent print jobs.
- When the waste toner full detection counter reaches a threshold value, the machine determines that there is a waste toner full condition.

## (a) Execution timing

The waste toner box full detection control is performed under any of the following conditions:

- "The machine determines that the waste toner box is mounted in place using the waste toner box set sensor."
- "The waste toner full sensor detects a waste toner near-full condition."
- "During a print cycle"
- "During execution of image stabilization control"

### 9.3.5 Waste toner box new article detection

- The waste toner box is not provided with any new article detection mechanism. Detection made by the waste toner full sensor is used for detecting a new waste toner box.
- When the waste toner full display appears, the existing waste toner box is replaced with a new one. When the waste toner full sensor remains unblocked for a predetermined period of time or more, the machine determines that the normal state is recovered (the old waste toner box is replaced with a new one).
- Determining that a new waste toner box has been mounted, the machine resets the waste toner full display, allowing the initiation of a new print cycle.
(1) Timing at which to reset the waste toner full display

The waste toner box full detection control is performed under any of the following conditions:

- "The waste toner full sensor detects a waste toner full condition."
- "The power switch is turned ON"
- "The front door is closed"

### 9.3.6 Waste toner spillage prevention shutter

- The toner collecting port for the transfer belt unit is provided with a waste toner spillage prevention shutter that prevents waste toner that is transported from the transfer belt from spilling during removal or reinstallation of the waste toner box.
- Inserting the waste toner box into its mounting position pushes the shutter at toner collecting port of the waste toner box, thus opening the toner collecting port
- Removing the waste toner box allows the shutter spring to close the shutter at the toner collecting port.

| :--- | :--- | :--- | :--- |
| $[3]$ | Paper lift-up cam | $[4]$ | Bypass pick-up solenoid (SD1) |
| $[5]$ | Manual bypass tray feed roller | $[6]$ | Manual bypass tray separation roller |
| $[7]$ | Paper lift-up plate | - | - |

### 10.4 Operation

### 10.4.1 Up/down control

- The paper lift-up plate is moved up and down by the transport motor.

## (1) Up operation

- The bypass pick-up solenoid is energized for a predetermined period of time during rotation of the transport motor. This unlocks the paper lift-up plate clutch and the driving force of the transport motor is transmitted to the paper lift-up cam.
- As the paper lift-up cam rotates, the paper lift-up plate which has so far been pushed down by the paper lift-up cam is raised to the paper feed position by the spring.
(2) Down operation
- The bypass pick-up solenoid is energized for a predetermined period of time during rotation of the transport motor. This rotates the paper lift-up cam, so that the cam pushes the paper lift-up plate down into its standby position.

| $[1]$ | Transport motor (M1) | $[2]$ | Bypass pick-up solenoid (SD1) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper lift-up cam | $[4]$ | Manual bypass tray feed roller |
| $[5]$ | Bypass paper empty sensor (PS27) | $[6]$ | Paper lift-up plate |
| $[7]$ | Paper lift-up plate clutch (mechanical) | $[8]$ | Bypass lift-up position sensor (PS26) |

## (3) Operation timing

(a) Move to paper feed position (up)

- At the start of a manual bypass paper feed sequence, the paper lift-up plate is raised to the paper feed position.
- After the lapse of a predetermined period of time, the bypass pick-up solenoid is deenergized. The paper lift-up plate is stopped at the paper feed position.
- The actuator of bypass lift-up position sensor rotates in synchronism with the paper lift-up cam. When the paper lift-up plate is raised, the actuator rotates to thereby unblock the bypass lift-up position sensor. Then, the machine determines that the paper lift-up plate is raised to the paper feed position
- If the bypass lift-up position sensor remains unblocked even after the bypass pick-up solenoid has been deenergized, the machine determines that the paper lift-up plate is at the paper feed position
- As the paper level lowers during paper feed, the spring pushes up the paper lift-up plate, so that the paper stack is pushed up to the optimum paper feed position.

[2]

| $[1]$ | Paper lift-up cam (standby position) | $[2]$ | Paper lift-up plate (standby position) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper lift-up cam (paper feed position) | $[4]$ | Paper lift-up plate (paper feed position) |

## (b) Move to standby position (down)

- The paper lift-up plate is lowered if there is no print job that uses the manual bypass trays and the paper exit sensor detects a sheet of paper fed from the manual bypass tray.
- The paper lift-up plate is lowered if the above conditions are met even during execution of another job.
- If a bypass paper empty condition is detected at the paper feed position, the paper lift-up plate is lowered to the standby position.
- If a paper misfeed occurs, the paper lift-up plate is stopped at the paper feed position. When the transport motor rotates stably after the misfeed is cleared, the paper lift-up plate is lowered to the standby position.
- After the lapse of a predetermined period of time, the bypass pick-up solenoid is deenergized. The paper lift-up plate is stopped at the standby position. As the paper lift-up plate lowers, the bypass lift-up position sensor is blocked. The machine determines that the paper lift-up plate is at the standby position based on the fact that the bypass lift-up position sensor is blocked even after the bypass pick-up solenoid has been deenergized.

### 10.4.2 Paper feed control

(1) Pick-up control (bizhub C368/C308/C258)

- Paper feed operations of the manual bypass tray are driven by the transport motor.
- The bypass pick-up solenoid is energized by a print start signal and the paper is raised to the paper feed position.
- After the paper is raised to the paper feed position, the bypass paper feed clutch is energized.
- When the bypass paper feed clutch is energized, the drive from the transport motor is transmitted to the manual bypass tray paper feed roller, so that the paper can be fed in.
- The manual bypass tray paper feed roller feeds the paper onto the registration roller.
- When the paper fed from the manual bypass tray is reached onto the registration roller, the bypass paper feed clutch is deenergized to stop the manual bypass tray paper feed roller from rotating.
- The bypass pick-up solenoid is energized and the paper is lowered to the standby position.
- If the registration sensor does not detect paper even after the lapse of a predetermined period of time, the machine determines that there is a paper misfeed at the manual bypass tray. Note, however, that the paper feed sequence is repeated a second time if a paper misfeed is detected. If the registration sensor is still unable to detect paper, the machine determines that there is a paper misfeed at the manual bypass tray. (Paper feed retry control)

## (2) Pick-up control (bizhub C658/C558/C458)

- Paper feed operations of the manual bypass tray are driven by the paper feed motor.
- The bypass pick-up solenoid is energized by a print start signal and the paper is raised to the paper feed position.
- After the paper is raised to the paper feed position, the bypass paper feed clutch is energized.
- When the bypass paper feed clutch is energized, the drive from the paper feed motor is transmitted to the manual bypass tray paper feed roller, so that the paper can be fed in.
- The manual bypass tray paper feed roller feeds the paper onto the registration roller.
- When the paper fed from the manual bypass tray is reached onto the registration roller, the bypass paper feed clutch is deenergized to stop the manual bypass tray paper feed roller from rotating.
- The bypass pick-up solenoid is energized and the paper is lowered to the standby position
- If the registration sensor does not detect paper even after the lapse of a predetermined period of time, the machine determines that there is a paper misfeed at the manual bypass tray. Note, however, that the paper feed sequence is repeated a second time if a paper misfeed is detected. If the registration sensor is still unable to detect paper, the machine determines that there is a paper misfeed at the manual bypass tray. (Paper feed retry control)

| $[1]$ | Paper feed motor (M22) | $[2]$ | Bypass paper feed clutch (CL7) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Manual bypass tray separation roller | $[4]$ | Manual bypass tray feed roller |
| $[5]$ | Paper | - | - |

(3) Separation control

- The manual bypass tray separation roller is pressed up against, and driven by, the manual bypass tray feed roller. A torque limiter is equipped on the shaft of the manual bypass tray separator roller.
- The acting pressure of the manual bypass tray feed roller/manual bypass tray separation roller/torque limiter serves as the limit torque for preventing double feed.
- When there is no sheet of paper or only one sheet of paper between the manual bypass tray separation roller and manual bypass tray feed roller, the limit torque is exceeded and the manual bypass tray separation roller follows the rotation of the manual bypass tray paper feed roller.
- If there are two or more sheets of paper between the manual bypass tray separation roller and manual bypass tray feed roller, the limit torque is greater than the friction force of the paper, so that the manual bypass tray separation roller stops rotating.
- Because of the stationary manual bypass tray separation roller, the lower sheet of paper in contact with the manual bypass tray separation roller is not fed in, so that the first sheet of paper is properly separated from the second sheet of paper.

## (4) Periodical replacement parts

- The manual bypass tray feed roller and manual bypass tray separation roller are periodical replacement parts. These two rollers must be replaced with new ones at the same time.
- Neither the manual bypass tray feed roller nor manual bypass tray separation roller is provided with a new article detection mechanism. When the two rollers are replaced with new ones, the "Manual Tray" counter must be reset to zero using [Counter] -> [Life] of the Service Mode.
- The number of times the manual bypass tray has been subjected to paper feed operations can be checked with the "Manual Tray" counter of the Service Mode.

| Periodical replacement cycle | Paper feed operations 200,000 times |
| :--- | :--- |

- For details of the applicable replacement procedures for the manual bypass tray feed roller and manual bypass tray separation roller and the Service Mode, see "F.7.7.3 Replacing the manual bypass tray feed roller, manual bypass tray separation roller assy".
Manual bypass tray feed roller

Manual bypass tray separation roller assy

### 10.4.3 Paper size detection control

- The standard size of the paper loaded in the manual section is detected automatically by the combination of ON or OFF positions of the two bypass FD paper size sensors and the bypass CD paper size VR.
- The two bypass FD paper size sensors are mounted in positions at which they can detect length even with the sub tray closed.
- The size detection gear rotates by the moving of the paper guide. The bypass CD paper size VR mounted on the same axis as the size detection gear detects the paper width.
- The machine supports detection of SRA3 size.
- Irregular paper sizes and postcard can be used by entering the custom size.

## NOTE

- The paper guide has been extended to inhibit "paper skew" caused when the paper is fed and "paper jam due to paper skew".

| $[1]$ | Paper guide (rear side) | $[2]$ | Bypass CD paper size VR (VR1) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Bypass FD paper size sensor1 (PS28) | $[4]$ | Sub tray |

| $[7]$ | Actuator 1 | $[8]$ | Size detection gear |
| $[9]$ | Paper guide (front side) | - | - |

## (1) Sheet size determination

| Paper size detected | Bypass FD paper size sensor1 | Bypass FD paper size sensor2 | Bypass CD paper size VR |
| :---: | :---: | :---: | :---: |
|  |  |  | Unit: mm |
| A6S | OFF | OFF | Less than 115 |
| B6S |  |  | 115 to 144 inclusive |
| A5 * |  |  | 196 to 225 inclusive * |
| Invoice ( $5 \frac{1}{2} \times 8 \frac{1}{2}$ ) * |  |  |  |
| B5 * |  |  | 242 to 268 inclusive * |
| Executive ( $\mathbf{7}^{1 / 4 \times 10 \frac{1}{2} \text { ) * }}$ |  |  |  |
| A5S * | ON | OFF | 133 to 164 inclusive * |
| Invoice S ( ${ }^{1 / 2} \times 8$ ¹/2S ${ }^{\text {* }}$ |  |  |  |
| B5S * |  |  | 169 to less than 196 * |
| Executive S (7 1/4 $\times 101 / 2 \mathrm{~S}$ ) * |  |  |  |
| A4S * |  |  | 196 to 225 inclusive * |
| Letter S ( $81 / 2 \times 11 \mathrm{~S}$ ) * |  |  |  |
| Letter ( $81 / 2 \times 11$ ) |  |  | 255 to less than 288 |
| A4 |  |  | 288 to 330 inclusive |
| Legal ( $81 / 2 \times 14$ ) | ON | ON | 201 to 231 inclusive |
| B4 |  |  | 242 to less than 268 |
| Ledger (11 $\times 17$ ) |  |  | 268 to less than 288 |
| A3 |  |  | 288 to less than 301 |
| A3 wide (12 $\times 18$ ) |  |  | 301 to 312.5 inclusive |
| SRA3 |  |  | Over 312.5 and up to 330 |

- *: When the area is in inches, the size is detected in inches; for other areas, $A / B$ size is detected.

### 10.4.4 Paper empty detection control

- When the paper is loaded in the manual bypass tray, the paper empty detection actuator is pressed by the leading edge of the paper. The paper empty detection actuator is pressed to unblock the bypass paper empty sensor
- When there is no paper on the manual tray, the paper empty detection actuator is raised. The paper empty detection actuator is returned to its original position to thereby block the bypass paper empty sensor.

### 10.4.5 Paper separation pressure switching mechanism

- Paper misfeed may infrequently occur at use of 300g thick paper. (Paper separation pressure is too low for thick paper)
- Switch the pressure (paper separation pressure) of the manual separation roller pressing down on the feed roller to increase the paper separation pressure and reduce a paper misfeed.
- For details about the adjustment procedure, see I.11.2.3 Separator roller pressure adjustment of the bypass tray.

## NOTE

- It does not require to switch the paper separation pressure if paper misfeeds do not occur even at use of $\mathbf{3 0 0} \mathbf{g}$ thick paper.
- Use of plain paper under high-temperature, high-humidity environment after the paper separation pressure is switched may cause a paper misfeed infrequently. (Paper separation pressure is too high for plain paper)

## 11. PAPER FEED SECTION

### 11.1 Configuration

### 11.1.1 Tray 1 (bizhub C368/C308/C258)

### 11.2 Drive

### 11.2.1 Drive (bizhub C368/C308/C258)

- Drive parts are arranged in the same way in tray 1 and tray 2 . If the description that follows is not identified with tray 1 or tray 2 , it is applicable to both tray 1 and tray 2 in terms of mechanism and control
- Transport motor drives the tray1 and 2 paper feed roller section.
- The drive section of each tray has a clutch that controls rotation of the paper feed roller section.

| $[1]$ | Vertical transport roller | $[2]$ | Tray 1 separation roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Tray 1 feed roller | $[4]$ | Tray 1 pick-up roller |
| $[5]$ | Tray 1 paper feed clutch (CL3) | $[6]$ | Transport motor (M1) |
| $[7]$ | Tray 2 vertical transport clutch (CL2) | $[8]$ | Tray 2 paper feed clutch (CL1) |
| $[9]$ | Tray 2 pick-up roller | $[10]$ | Tray 2 separation roller |
| $[11]$ | Tray 2 feed roller | - | - |

### 11.2.2 Drive (bizhub C658/C558/C458)

- Drive parts are arranged in the same way in tray 1 and tray 2 . If the description that follows is not identified with tray 1 or tray 2 , it is applicable to both tray 1 and tray 2 in terms of mechanism and control.
- Paper feed motor drives the tray 1 and tray 2 feed roller section.
- The drive section of each tray has a clutch that controls rotation of the paper feed roller section.
- Forward and reverse operation of the paper feed motor enables switching between drive of the tray 1 paper roller and tray 2 paper roller.
- The one-way clutch on the transport motor drive shaft switches drive modes.
- The tray 2 vertical transport motor drives the vertical transport motor.

Paper feed drive

| $[1]$ | Paper feed motor (M22) | $[2]$ | One-way clutch |
| :--- | :--- | :--- | :--- |
| $[3]$ | Tray 1 pick-up roller | $[4]$ | Tray 1 feed roller |

| $[7]$ | Tray 2 separation roller | $[8]$ | Tray 2 pick-up roller |
| $[9]$ | Tray 2 paper feed clutch $(C L 1)$ | - | - |

Conveyance drive (tray 2)

| $[1]$ | Tray 2 vertical transport motor (M23) | [2] Vertical transport roller |
| :--- | :--- | :--- |

### 11.3 Operation

### 11.3.1 Up/down control

- Tray 1 and tray 2 are controlled in the same control procedure.

## (1) Up operation

- The paper lift-up plate $B$ is located under the paper lift-up plate $A$.
- The lift-up plate drive shaft of the tray $1 / 2$ lift-up motor is connected to paper lift-up plate $B$.
- When the drive shaft of the tray $1 / 2$ lift-up motor rotates, paper lift-up plate B raises paper lift-up plate A

The following illustration is for bizhub C368/C308/C258.

| $[1]$ | Tray 1 upper limit sensor (PS25) / Tray 2 upper limit <br> sensor (PS22) | $[2]$ | Tray 1 lift-up motor (M12) / Tray 2 lift-up motor (M13) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper | $[4]$ | Lift-up plate drive shaft |
| $[5]$ | Paper lift-up plate B | $[6]$ | Paper lift-up plate A |

## (2) Down operation

- When the tray is slid out of the machine, the coupling of tray $1 / 2$ lift-up motor and the lift-up plate drive shaft are disconnected from each other.
- When the driving force of tray $1 / 2$ lift-up motor is released from the lift-up plate drive shaft, the paper lift-up plate starts lowering by its own weight.
The following illustration is for bizhub C368/C308/C258.

[5]

| $[1]$ | Pick-up roller | $[2]$ | Light blocking plate of upper limit sensor |
| :--- | :--- | :--- | :--- |
| $[3]$ | Tray 1 upper limit sensor (PS25) / Tray 2 upper limit <br> sensor (PS22) | $[4]$ | Tray 1 lift-up motor (M12) / Tray 2 lift-up motor (M13) |
| $[5]$ | Paper | $[6]$ | Paper lift-up plate B |
| $[7]$ | Paper lift-up plate A | - | - |

## (3) Operation timing

(a) When the tray is slid in

- When the tray is slid into the machine, the sensor on the tray $1 / 2$ FD paper size board is blocked. The machine then determines that the tray is slid into position.
- The paper lift-up plate is lowering when the tray is slid out, so that the tray $1 / 2$ upper limit sensor is unblocked.
- Determining after tray insertion that the tray $1 / 2$ upper limit sensor is unblocked, the machine lets the tray $1 / 2$ lift-up motor rotate to start the up operation of the paper lift-up plate.
- When the paper stack is raised to a predetermined height after the up operation of the paper lift-up plate has been started, the tray $1 / 2$ upper limit sensor is blocked
- Determining that the tray $1 / 2$ upper limit sensor is blocked, the machine stops the tray $1 / 2$ lift-up motor to complete the up operation of the paper lift-up plate.
- Control is provided to make sure that only one tray performs the up operation at one time.
- If the tray is slid out during the up operation of the paper lift-up plate and accordingly the sensor on the tray $1 / 2$ FD paper size board is unblocked, the up operation of the paper lift-up plate is terminated.

## (b) During a print cycle

- When the amount of paper decreases as the unit keeps printing, the pick-up roller will gradually come down to unblock the tray $1 / 2$ upper limit sensor. The tray $1 / 2$ lift-up motor will rotate again to lift up the paper lift-up plate.
- When the tray $1 / 2$ upper limit sensor is blocked, the tray $1 / 2$ lift-up motor will stop to stop lift-up the paper lift-up plate.
- The sequence of these operations is repeated to keep constant the pressure between the pick-up roller and paper stack (paper takeup pressure) regardless of the amount of paper still available for use.

### 11.3.2 Paper feed control (bizhub C368/C308/C258)

- Tray 1 and tray 2 are controlled in the same control procedure.

## (1) Pick-up control

- The tray $1 / 2$ paper feed clutch is energized after the lapse of a predetermined period of time after the print start signal.
- The driving force of the transport motor is transmitted to the pick-up roller and paper feed roller when the tray $1 / 2$ paper feed clutch is energized. These rollers rotate to pick up and feed a sheet of paper into the machine.

## (2) Separation control

- The separation roller is pressed up against the feed roller by the pressure of a spring and an acting pressure generated from torque of the torque limiter.
- The acting pressure of the feed roller/separation roller/torque limiter serves as the limit torque for preventing double feed
- When there is no sheet of paper or only one sheet of paper between the separation roller and feed roller, the limit torque is exceeded and the separation roller follows the rotation of the feed roller
- If there are two or more sheets of paper between the separation roller and feed roller, the limit torque is greater than the friction force of the paper, so that the separation roller is not rotated.
- The separation roller causes the lower sheet of paper in contact with the separator roller to be pushed backward in the direction of the tray, so that the lower sheet of paper is properly separated.
- Only the upper paper contacting the feed roller is conveyed to the registration section.

| $[1]$ | Feed roller | $[2]$ | Separation roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper | $[4]$ | Pick-up roller |

## (3) Periodical replacement parts

- The pick-up roller, feed roller, and separation roller are periodical replacement parts. These three rollers must be replaced with new ones at the same time.
- None of the pick-up roller, feed roller, and separation roller is provided with a new article detection mechanism. When the three rollers are replaced with new ones, the "1st." or "2nd." counter must be reset to zero using [Counter] -> [Life] of the Service Mode.
- The number of times tray $1 /$ tray 2 has been subjected to paper feed operations can be checked with the " 1 st./2nd." counter of the Service Mode.

[1] Pick-up roller $\quad$ [2] Feed roller/Separation roller
- To improve exchangeability, the pick-up roller, feed roller, and separation roller are held in position on one side. At the time of replacement, remove the paper feed tray and remove the C-clip on one side. It allows each of the three rollers to be removed.
- For details of the applicable replacement procedures for the pick-up roller, feed roller, and separation roller and the Service Mode, see " F.7.7.1 Replacing the tray 1 feed roller, tray 1 pick-up roller, tray 1 separation roller" and "F.7.7.2 Replacing the tray 2 feed roller, tray 2 pick-up roller, tray 2 separation roller."

### 11.3.3 Paper feed control (bizhub C658/C558/C458)

## (1) Pick-up control

- The paper feed motor turns ON when the predetermined amount of time elapses after the print start signal is input. Drive power transfers to tray 1 and tray 2 via forward and reverse operation of the paper feed motor.
- Drive power from the paper feed motor transfers to the tray 1 pick-up roller and feed roller when the paper feed motor is turned ON. Paper is picked up and fed by the rotation of the rollers.
- Drive power from the paper feed motor transfers to the tray 2 pick-up roller and feed roller when the tray 2 paper feed clutch is turned ON. Paper is picked up and fed by the rotation of the rollers.

## (2) Separation control

- The separation roller is pressed up against the feed roller by the pressure of a spring and an acting pressure generated from torque of the torque limiter.
- The acting pressure of the feed roller, separation roller, and torque limiter serves as the limit torque for preventing double feed.
- When there is no sheet of paper or only one sheet of paper between the separation roller and feed roller, the limit torque is exceeded and the separation roller follows the rotation of the feed roller.
- If there are two or more sheets of paper between the separation roller and feed roller, the limit torque is greater than the friction force of the paper, so that the separation roller is not rotated.
- The separation roller causes the lower sheet of paper in contact with the separator roller to be pushed backward in the direction of the tray, so that the lower sheet of paper is properly separated.
- Only the upper paper contacting the feed roller is conveyed to the registration section.

| $[1]$ | Feed roller | $[2]$ | Separation roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper | $[4]$ | Pick-up roller |

## (3) Periodical replacement parts

- The pick-up roller, feed roller, and separation roller are periodical replacement parts. These three rollers must be replaced with new ones at the same time.
- None of the pick-up roller, feed roller, and separation roller is provided with a new article detection mechanism. When the three rollers are replaced with new ones, the "1st." or "2nd." counter must be reset from [Service Mode] -> [Counter] -> [Life].
- The number of times tray $1 /$ tray 2 has been subjected to paper feed operations can be checked with the "1st./2nd." counter of the Service Mode.

| $[1]$ | Pick-up roller | Feed roller, Separation roller |
| :--- | :--- | :--- | :--- |

- To improve exchangeability, the pick-up roller, feed roller, and separation roller are held in position on one side. At the time of replacement, remove the paper tray and release the claws on each roller to remove each of the three rollers.
- For details of the applicable replacement procedures for the pick-up roller, feed roller, and separation roller and the Service Mode, see " F.8.8.1 Replacing the tray 1 feed roller, tray 1 pick-up roller, tray 1 separation roller" and "F.8.8.2 Replacing the tray 2 feed roller, tray 2 pick-up roller, tray 2 separation roller."

### 11.3.4 Paper feed retry control

- If the specified sensor is unable to detect the paper even after the lapse of a predetermined period of time after the start of the paper feed sequence, the machine determines that there is a paper misfeed. To reduce possibility of paper misfeed, if a paper misfeed is detected during a print job under the following conditions, the paper feed sequence is performed again (retry) only once. The feed roller is temporarily stopped, and is then turned again. A paper misfeed results if the specified sensor is still unable to detect the paper even after the paper feed retry sequence, the machine determines that there is a paper misfeed.
bizhub C368/C308/C258

| Paper port | Paper feed retry control | Sensor name |
| :--- | :--- | :--- |
| Manual bypass tray | Only in black mode | Registration sensor |
| Tray 1 | No retry control is performed. |  |
| Tray 2 | Only in black mode | Tray 2 vertical transport sensor |

### 11.3.5 Feed roller speed reduction control

- During multi-print cycles, the target printed pages number is maintained due to correction of the transport speed variations and a proper paper-to-paper distance.
- Measure the time that is taken from starting paper feed to the paper feed sensor ON. If the paper-to-paper distance is too narrow, the paper roller is decelerated for a predetermined time, so that a proper paper-to-paper distance can be achieved.
- Feed roller speed reduction control is implemented when paper is fed from the following paper trays.

| Paper port | Controlled roller | Sensor name |
| :--- | :--- | :--- |
| Tray 1 | Tray 1 feed roller | Tray 1 paper feed sensor |
| Tray 2 | Tray 2 feed roller | Tray 2 paper feed sensor |

[2]

| $[1]$ | Preceding sheet | $[2]$ | Sheet of paper being controlled |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper feed sensor | - | - |

### 11.3.6 Vertical transport roller speed reduction control

- In the same manner as with the feed roller speed reduction control, control is performed to reduce the speed of the vertical transport roller during a multi-print cycle, thereby maintaining a proper paper-to-paper distance.
- Time it takes the vertical transport sensor to be activated after the start of a paper feed sequence is measured. If the distance between two sheets of paper is determined to be narrow, the vertical transport roller is decelerated for a predetermined period of time, so that a proper paper-to-paper distance can be achieved.
- Vertical transport roller speed reduction control is implemented paper is fed from the following paper trays.
bizhub C368/C308/C258

### 11.3.7 Paper transport control (bizhub C368/C308/C258)

(1) Tray 1

- The tray 1 feed roller feeds the paper onto the registration roller.
- The tray 1 paper feed sensor located downstream of the tray 1 feed roller detects the paper fed from the feed roller.
- When the paper fed from the feed roller moves past the registration roller and reaches a predetermined position, the tray 1 paper feed clutch is deenergized to disconnect the driving force of the transport motor. The pick-up roller and feed roller follow the movement of the paper, continuing rotating. The pick-up roller and feed roller stop rotating as soon as the paper moves past them.
- If the registration sensor is unable to detect paper even after the lapse of a predetermined period of time, the machine determines that there is a paper misfeed at tray 1.

## (2) Tray 2

- The tray 2 feed roller feeds the paper onto the tray 2 vertical transport roller.
- The tray 2 paper feed sensor located downstream of the tray 2 feed roller detects the paper fed from the tray 2 feed roller.
- When the tray 2 vertical transport sensor located downstream of the tray 2 vertical transport roller along the paper path detects the leading edge of the paper fed from the feed roller, the tray 2 paper feed clutch is deenergized to disconnect the driving force of the transport motor. The pick-up roller and feed roller follow the movement of the paper, continuing rotating. The pick-up roller and feed roller stop rotating as soon as the paper moves past them.
- If the tray 2 vertical transport sensor is unable to detect the leading edge of paper even after the lapse of a predetermined period of time, the machine determines that there is a paper misfeed at tray 2.

### 11.3.8 Paper transport control (bizhub C658/C558/C458)

## (1) Tray 1

- The tray 1 feed roller feeds the paper onto the registration roller.
- The tray 1 paper feed sensor located downstream of the tray 1 feed roller detects the paper fed from the feed roller.
- The paper feed motor turns OFF when the trailing edge of paper that is transported from the feed roller reaches the specified position upstream from the tray 1 feed roller. The pick-up roller and feed roller follow the movement of the paper, continuing rotating. The pick-up roller and feed roller stop rotating as soon as the paper moves past them.
- If the registration sensor is unable to detect paper even after the lapse of a predetermined period of time, the machine determines that there is a paper misfeed at tray 1 .

## (2) Tray 2

- The tray 2 feed roller feeds the paper onto the tray 2 vertical transport roller
- The tray 2 paper feed sensor located downstream of the tray 2 feed roller detects the paper fed from the tray 2 feed roller.
- The paper feed motor and the tray 2 paper feed clutch are turned OFF when the tray 2 vertical transport sensor located downstream from the tray 2 vertical transport roller along the paper path detects the leading edge of the paper that is fed from the feed roller. The pick-up roller and feed roller follow the movement of the paper, continuing rotating. The pick-up roller and feed roller stop rotating as soon as the paper moves past them.
- If the tray 2 vertical transport sensor is unable to detect the leading edge of paper even after the lapse of a predetermined period of time, the machine determines that there is a paper misfeed at tray 2.

### 11.3.9 Downstream exit control during multi-print cycle

- When a paper jam in the paper feed section is detected, the print operation does not stop immediately. Paper that has been printed completely and paper that can be printed completely is discharged outside of the machine after being printed.
- Completely discharge printed paper to make jam removal easily and reduce paper consumption.
(1) Downstream exit control jams

| Misfeed at tray 1 paper feed section | Misfeed at LCC (PC-410/PC415) paper feed section |
| :--- | :--- |
| Misfeed at tray 2 paper feed section | Misfeed at LCT (LU-207/LU-302) paper feed section |
| Misfeed at tray 3 paper feed section | Misfeed at manual bypass tray paper feed section |
| Misfeed at tray 4 paper feed section | Misfeed at vertical transport section |

## (2) 1-sided printing

1. Stops the feeding of paper [3] where the jam occurred and the transport operation.
2. Exit paper [1].
3. Transfers, fuses image onto, and then discharges paper [2].

| $[1]$ | Sheet after a 1-sided image transfer | $[2]$ | Sheet before a 1-sided image transfer |
| :--- | :--- | :--- | :--- |
| $[3]$ | Jamming paper | $[4]$ | Jamming |

## (3) 2-sided printing

1. Stops the feeding of paper [4] where the jam occurred and the transport operation.
2. Exit paper [1].
3. Transfer and fuse 2-side image onto, and then exit, sheets [3] and [5] located at the reverse/duplex section.
4. Performs 2 -sided printing and discharges paper [3] in the pre-image transfer process.

| $[1]$ | Sheet after a 2-sided image transfer | $[2]$ | Sheet before a 1-sided image transfer |
| :--- | :--- | :--- | :--- |
| $[3]$ | Sheet after a 1-sided image transfer | $[4]$ | Jamming paper |
| $[5]$ | Sheet after a 1-sided image transfer | $[6]$ | Jamming |

### 11.3.10 Paper pick-up pressure switching mechanism

- A paper misfeed may infrequently occur, if lightweight 52 g recycled paper, or the like, is used under high temperature, high humidity environment. (Paper pick-up pressure is too high for the thin paper)
- Replacement of the pick spring that is mounted to paper feed unit 2 may lower the paper pick-up pressure and reduce the paper misfeed.
- For the replacement procedure, see " I.11.2.2 Pick-up pressure adjustment of the tray 1/2".

## NOTE

- Since the spring is available to the recommended thin paper (CS520), replacement is not required.
- At using plain paper under high-temperature, high-humidity environment or feeding thick paper after replacement of the pick-up spring, a paper misfeed may infrequently occur. (Paper pick-up pressure is too low for the thick paper)

### 11.3.11 Paper size detection contro

(1) Paper width detection (CD)

- The size in paper width is detected with the combination of ON/OFF the transmission type photosensors 1,2 on the CD paper size board.
- The CD paper size sensor is unblocked or blocked according to the position of the paper width detection plate connected to the paper width guide plate.

## (2) Paper length detection (FD)

- The size in paper length is detected with the combination of ON/OFF transmission type photosensors 1 to 4 on the FD paper size board.
- The FD paper sensor is unblocked or blocked by the paper length detection plate position connected to the paper length guide plate.
- The sensor on the FD paper size board also functions to detect whether the tray is mounted.

(3) Sheet size determination
- The 2 CD paper size sensors detect the paper width, and the 4 FD paper size sensors detect the paper length. Paper size is determined with the combination of the above paper width and paper length.

| Paper size | FD paper size board |  |  |  | CD paper size board |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Sensor 4 | Sensor 3 | Sensor 2 | Sensor 1 | Sensor 2 | Sensor 1 |
| SRA3 (*1) | H | L | L | H | H | H |
| A3 Wide (*1) | H | L | L | H | L | H |
| A3 | L | L | H | L | L | H |
| B4 | L | H | H | H | L | H |
| A4S | H | H | L | L | L | L |
| A4 | H | L | L | H | L | H |
| B5S | L | H | H | L | L | L |
| B5 | L | H | L | L | L | H |
| A5S (*2) | H | L | H | L | L | L |
| Invoice S (*2) | H | L | H | L | L | L |
| Ledger (11×17) | L | L | H | L | H | H |
| Legal ( $81 / 2 \times 14)$ | L | H | H | H | L | L |
| Letter S ( $8^{1 / 2 \times 11}$ S) | L | L | L | H | L | L |
| Letter ( $8^{1 / 2} \times 11$ ) | H | L | H | L | H | H |
| FLS S (*3) | H | H | H | H | L | L |
| $8 \mathrm{~K} \mathrm{~S} \mathrm{(270} \mathrm{~mm} \mathrm{x} 390 \mathrm{~mm}$ ) | L | H | L | H | H | H |
| 16K (270 mm × 195 mm ) | L | H | H | L | H | H |

- *1: SRA3 and A3 Wide are support only from the tray 2 and the bypass tray.
- *2: For regions using inches, Invoice S size is detected. For other regions, A5S size is detected.
- FLS can be configured with one of the following paper sizes from Foolscap Size Setting in Service Mode.
- $8 \frac{1}{2} \times 13 \frac{1}{2}, 8 \times 13,8 \frac{1}{4} \times 13,8 \frac{1}{2} \times 13$
(a) Sensor states

| Sensor |  | Physical state |  |
| :--- | :---: | :---: | :---: |
|  | HIGH signal | LOW signal |  |
| FD paper size board: sensor 1 to 4 | Blocked | Unblocked |  |
| CD paper size board: sensor 1, 2 |  |  |  |

### 11.3.12 Paper length guide operation mechanism

Two methods are provided to operate the paper length guide.

- Squeeze the paper length guide to operate it in the direction orthogonal to the direction of movement.
- Squeeze the paper length guide to operate it in the same direction as the direction of movement

## [1]

[2]

[3]

| $[1]$ | Squeeze in the same direction as the direction of <br> movement | [2] | Squeeze in the direction orthogonal to the direction of <br> movement |
| :--- | :--- | :--- | :--- |
| $[3]$ | Movement direction of paper length guide | $[4]$ | Paper length guide |

### 11.3.13 Paper width guide

- A latching positioning method is used to prevent paper width guide misalignment due to shock that is generated during insertion of trays.
- Operating the lock lever releases the lock that is installed to the front side of the paper width guide. The paper width guide can then be moved.
- The front side paper width guide is equipped with a support guide. The support guide presses paper in the tray with spring force to reduce paper skew.

| $[1]$ | Paper width guide | $[2]$ | Lock lever |
| :--- | :--- | :--- | :--- |
| $[3]$ | Support guide | - | - |

### 11.3.14 Remaining paper detection control

- The remaining paper detection control is performed under any of the following conditions:
- "Tray $1 /$ tray 2 is closed in position"
- "The up/down control of the paper lift-up plate is completed"

## (1) Paper near-empty detection

- The tray $1 / 2$ near empty sensor detects a paper near-empty condition of the tray.
- As paper is consumed, the paper lift-up plate is raised. This raises the near empty detection actuator provided at the lift-up plate drive shaft of the lift-up motor
When a sufficient amount of paper is loaded

- When the near empty detection actuator is raised to a position at which the tray $1 / 2$ near empty sensor is blocked, the machine detects a near-empty condition.
NOTE
- A near-empty condition is detected when the amount of paper still available for use becomes about 50 sheets. Near empty condition

| $[1]$ | Actuator | $[2]$ | Tray $1 / 2$ paper near empty sensor (PS11/PS12) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Tray 1/2 lift-up motor (M12/M13) | $[4]$ | Paper |
| $[5]$ | Paper lift-up plate | - | - |

## (2) Paper empty detection

- Tray 1 and tray 2 use the same control system to detect a paper empty condition.
- A paper empty condition is detected by the tray $1 / 2$ paper empty sensor.

[1] Actuator [2]
Tray 1/2 paper empty sensor (PS24/PS21)
(3) Remaining paper level display
- The amount of remaining paper is indicated by the LED on the right side of each tray and by the screen of the control panel.
- The following shows how the level is displayed.

| Tray condition | Empty | Near empty | Other statuses (Including during lift-up and no tray conditions) |
| :---: | :---: | :---: | :---: |
| LED | ON | Blinking/OFF * | OFF |

*: LED turns OFF when Paper Remainder is set to Type 2: Service Mode -> System 1 -> Machine State LED Setting -> Paper Remainder.

[^52]
### 11.3.15 Paper feed tray locking mechanism

- The paper feed tray is provided with a locking mechanism.

## (1) Unlocking the paper feed tray

- With drawing the lever of the paper feed tray to the front will disengage the tray lock lever equipped on the right side of the paper feed tray.
- The paper feed tray can be pulled out of the machine by continuing pulling the lever with the tray lock lever disengaged.
- Rollers are provided for the right and left tray rails. They reduce the operating force required for sliding in/out the paper feed tray.

## (2) Locking the paper feed tray

- Pushing the lever of the paper feed tray all the way toward the rear will allow the paper feed tray to be slid into the machine.
- When the paper feed tray is inserted all the way in place, the tray lock lever equipped on the right side of the paper feed tray locks the tray in place.
- To prevent false detection, the paper feed tray is equipped with a spring in the rear that pushes the tray back out if the tray is not inserted all the way in place.

| [1] Lever of the paper feed tray | [2] Lock lever |
| :--- | :--- | :--- |

### 11.3.16 Roller retract mechanism

- When the paper feed tray is inserted or pulled out, there is a mechanism which retracts the pick-up roller and the separation roller.
- The pick-up roller retracts from the paper.
- The separation roller retracts from the feed roller.

Front view

## [6]

| $[1]$ | Feed roller | $[2]$ | Separation roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Separation roller pressure spring | $[4]$ | Paper |
| $[5]$ | Pick-up roller | $[6]$ | Pick-up roller pressure spring |

## (1) Pick-up roller retract mechanism

- When the paper feed tray is inserted or pulled out, the pick-up roller prevents the paper from being damaged.
- The pick-up roller comes down through spring pressure when the paper feed tray is closed. When paper is placed, the roller is pressed against the paper surface. (Paper feed position)
- Released the paper feed tray lock, the roller lifting lever is also released and the pick-up roller holder is pushed up to the retracted position. It prevents the paper surface from being damaged even if the paper tray is pulled out.

Left side view

| $[1]$ | Roller lifting lever | $[2]$ | Pick-up roller holder |
| :--- | :--- | :--- | :--- |
| $[3]$ | Pick-up roller (retracted position) | $[4]$ | Paper |
| $[5]$ | Paper feed tray (lock released) | - | - |

## (2) Separation roller retract mechanism

- When a paper jam occurs and paper is caught between rollers where the feed roller is pressing the separation roller, paper will be left inside the machine through pulling out the paper feed tray. If you insert the paper feed tray in that state, the paper may get torn in pieces which may fall off and scatter inside the machine. It prevents paper from being torn or falling off through retracting the separation roller.
- The separation roller is pressed against the feed roller by spring pressure when the paper feed tray is closed. (Paper feed position)
- Release the paper tray lock, the roller pushdown lever is also released and the separation roller retract lever is pushed down to the retracted position. It releases the paper from the rollers even if it is jammed between the rollers.

Left side view

| $[1]$ | Roller pushdown lever | $[2]$ | Feed roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Separation roller (retracted position) | $[4]$ | Separation roller retract lever |
| $[5]$ | Paper feed tray (lock released) | - | - |

### 11.3.17 Paper feed tray stopper release mechanism

- The paper feed tray is equipped with a stopper mechanism.
- When paper is placed, the stopper prevents the paper feed tray from falling off from the machine even if it is pulled out.
- The paper feed tray can be removed if paper is remained inside the machine at the time of handling a paper jam or a misfeed.

## NOTE

- The paper feed stopper release mechanism is mounted only on tray 1, tray 2, and optional PC-115/215.
- To remove trays 3 and 4 of optional PC-110/210, remove the paper feed stopper ( 1 screw).

## (1) Releasing the paper tray stopper

- Press the stopper on its left side, the stopper lock will be released.
(2) Locking the paper tray stopper
- Press the stopper on its right side, the stopper lock will be locked. NOTE
- A mechanism is provided to push and lock the stopper through closing the paper tray to its home position even if you forget to lock it. (Mechanism to prevent forgetting lock)

## 12. REGISTRATION SECTION

### 12.1 Configuration

12.1.1 Configuration (bizhub C368/C308/C258)

| $[1]$ | Fusing loop sensor (PS2) | $[2]$ | Registration roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | 2nd transfer roller | $[4]$ | Registration sensor1 (PS1) |
| $[5]$ | Registration clutch (CL4) | $[6]$ | Transport motor (M1) |
| $[7]$ | Fusing unit | - | - |

12.1.2 Configuration (bizhub C558/C458)

| $[1]$ | Fusing loop sensor (PS2) | $[2]$ | Registration roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | 2nd transfer roller | $[4]$ | Registration sensor2 (PS72) * |
| $[5]$ | Registration sensor1 (PS1) | $[6]$ | Registration clutch (CL4) |
| $[7]$ | Transport motor (M1) | $[8]$ | Fusing unit |

- *: Only bizhub C558 is equipped with the registration sensor 2.

### 12.1.3 Configuration (bizhub C658)

| $[1]$ | Fusing loop sensor (PS2) | $[2]$ | Registration roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | 2nd transfer roller | $[4]$ | Registration sensor2 (PS72) |
| $[5]$ | Registration sensor1 (PS1) | $[6]$ | Registration motor (M24) |
| $[7]$ | Fusing unit | - | - |

### 12.2 Operation

### 12.2.1 Registration control

- The transport motor and registration clutch controls rotation of the registration roller. Note that control in bizhub C658 models is provided by the registration motor.
- The paper will create a loop between the tray 1 paper feed roller (or tray 2 vertical transport roller or bypass paper feed roller) and the registration roller when the paper is being conveyed in order to correct the skew.
- Registration roller is controlled in order to synchronize the timing the unit starts writing the image and conveying paper.
- The amount of the loop of the paper can be adjusted in the [Service Mode] -> [Machine] -> [Printer Reg. Loop Adj.]. Changing the adjustment value will change the amount of loop in the paper.

## (1) Operation

1. The paper is transported while the registration roller is stationary.
2. The registration sensor1 detects the leading edge of the paper, which is interpreted to mean that the paper has reached the registration roller.
3. A paper loop is formed thus skew in the paper is corrected.
4. The registration roller rotates to transport the paper.

| $[1]$ | Registration roller | $[2]$ | Loop formation |
| :--- | :--- | :--- | :--- |
| $[3]$ | Manual bypass tray feed roller | $[4]$ | Tray 1 feed roller |
| $[5]$ | Registration sensor1 (PS1) | - | - |

(2) Paper trailing edge detection (bizhub C658/C558)

- The registration sensor2 is provided to detect paper trailing edges.
- The registration sensor2 is a reflective optical sensor which detects paper using reflected light.
- The registration sensor1 (photosensor and actuator) is used to detect paper leading/trailing edges. However, paper detection accuracy decreases when the speed of paper transport is increased. The registration sensor2 has been provided to resolve this issue.
- The registration sensor1 and registration sensor2 can be used in combination to increase the paper transport detection accuracy and reduce the paper transport variability.

| $[1]$ | Registration roller | $[2]$ | Registration sensor2 |
| :--- | :--- | :--- | :--- |
| $[3]$ | Registration sensor1 | $[4]$ | Registration sensor1 actuator |

### 12.2.2 Right door mechanism

- The machine has the right door to enable easy access into the inside of the machine for clearing a paper misfeed or performing other service jobs.
- The right door is mounted with the mechanisms of the vertical transport section, paper feed section (manual bypass tray), and the duplex section. For detailed functions of the paper feed section (manual bypass tray) and the duplex section, see the corresponding chapters.
- The regist unit (2nd transfer section, registration section, and duplex section) is found inside the right door when opened.
- The regist unit is not provided with a locking mechanism or open/close detection mechanism. The locking mechanism and open/close detection mechanism provided for the right door are used also for the regist unit. For details of the regist unit, see O.12.1.1 Configuration (bizhub C368/C308/C258), O.12.1.2 Configuration (bizhub C558/C458), and O.12.1.3 Configuration (bizhub C658).
The following illustration is for bizhub C368/C308/C258.

| $[1]$ | Right door section | [2] $\quad$ Regist unit |
| :--- | :--- | :--- |

Regist unit (registration section/ 2nd transfer section)

| $[1] ~ R e g i s t ~ u n i t ~$ | - | - |
| :--- | :--- | :--- |

Regist unit (duplex section)

## (1) Right door locking mechanism

- The right door is provided with a locking mechanism.
(a) Unlocking the right door
- With drawing the lever of the right door to the front will disengage the door lock pawls (three) equipped at the front side of the right door.
(b) Locking the right door
- Close the regist unit and then close the right door. When the right door is closed in its correct position, the door lock pawls (three) equipped at the front side of the right door lock the right door in place.

| $[1]$ | Door lock pawl (upper) | $[2]$ | Right door lever |
| :--- | :--- | :--- | :--- |
| $[3]$ | Door lock pawl (lower) | $[4]$ | Door lock pawl (center) |

## (2) Regist unit lock mechanism

1. When the right door is opened, the regist unit that is left locked to the right door is also opened.

- The regist unit can be separated from the right door when the regist unit lever is disengaged from the door lock pawl equipped on the right door side.

$$
\begin{array}{|ll|lc|}
\hline[1] & \text { Door lock pawl } & \text { [2] } & \text { Lever } \\
\hline
\end{array}
$$

## (3) Right door open/close detection mechanism

- The right door switch detects that the right door is opened or closed.
- When the right door is closed, the open/close detection plate equipped at an upper portion at the front of the right door presses the actuator of the right door switch. This turns ON the right door switch and the machine determines that the right door is closed.
- When the right door is opened, the actuator of the right door switch is released. This turns OFF the right door switch and the machine determines that the right door is opened, giving a message that prompts the operator to close the right door.
- On determining that the right door is open, the machine prohibits the use of all jobs but the fax reception job. A paper misfeed results if the right door is opened during a print cycle.

| $[1]$ | Right door | $[2]$ | Open/Close detection plate |
| :--- | :--- | :--- | :--- |
| $[3]$ | Right door switch (SW3) | - | - |

## 13. FUSING SECTION (bizhub C458/C368/C308/C258)

### 13.1 Configuration

| $[1]$ | Paper separator claws (noncontact type) | $[2]$ | Pressure roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Fusing pressure home sensor (PS38) | $[4]$ | Fusing roller |
| $[5]$ | Fusing heater lamp assy | $[6]$ | Heating roller thermistor1 (TH1) |
| $[7]$ | Heating roller thermistor2 (TH2) | $[8]$ | Heating roller temperature sensor (TEMS) * |
| $[9]$ | Heating roller thermostat (TS1) | $[10]$ | Fusing belt |

- *: Equipped to bizhub C368/C308/C258 only

### 13.2 Drive

### 13.2.1 Fusing section roller drive

| $[1]$ | Fusing motor (M3) | $[2]$ | Fusing drive release gear |
| :--- | :--- | :--- | :--- |
| $[3]$ | Pressure roller | $[4]$ | Fusing roller |
| $[5]$ | Heating roller | - | - |

### 13.2.2 Pressure roller pressure drive

| $[1]$ | Fusing motor (M3) | $[2]$ | Fusing lever |
| :--- | :--- | :--- | :--- |
| $[3]$ | Fusing belt | $[4]$ | Fusing pressure home sensor (PS38) |
| $[5]$ | Pressure cam | $[6]$ | Cam shaft |

### 13.3 Operation

### 13.3.1 Fusing drive release mechanism

- At the fusing drive position, transmit the driving force of the fusing motor to the pressure roller by a fusing drive release gear.
- Opening the right door places the fusing drive release lever in the fusing drive release position
- With the fusing drive release lever in the fusing drive release position, the fusing drive release gear is disconnected from the fusing motor and, instead, connected to the jam removal dial.
- If a paper misfeed occurs in the fusing section, opening the right door allows the jam removal dial to be used for removing the misfed paper.
[1]

| $[1]$ | Fusing drive position | $[2]$ | Fusing motor (M3) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Fusing drive release gear | $[4]$ | Fusing drive release lever |
| $[5]$ | Right door close position | $[6]$ | Connected to fusing motor |
| $[7]$ | Pressure roller | $[8]$ | Fusing drive release position |
| $[9]$ | Jam removal dial | $[10]$ | Connected to jam removal dial |
| $[11]$ | Right door open position | - | - |

### 13.3.2 Fusing speed correction

## (1) Fusing loop control

- To prevent double transferred images and brush effects that occur due to a difference in speed between paper transport during image transfer and fusing, a loop is formed in the paper between the 2nd transfer and fusing sections.
- The fusing loop sensor detects the length of the loop formed in the paper between the 2 nd transfer section and the fusing roller.
- The fusing motor increases or decreases the fusing speed according to the length of loop in the paper, thereby ensuring that the length of loop falls within a predetermined range.

| Fusing loop sensor | Loop amount | Fussing speed |
| :---: | :---: | :---: |
| Unblocking | Large | Speed-up |
| Blocking | Small | Slowdown |

| $[1]$ | Loop length: large | $[2]$ | Actuator |
| :--- | :--- | :--- | :--- |
| $[3]$ | Fusing loop sensor (PS2) | $[4]$ | 2nd transfer roller |
| $[5]$ | Loop length: small | $[6]$ | Fusing roller |

## Operation timing

- It starts controlling when the front-edge of the paper reaches to the predetermined position before the fusing roller.
- The fusing speed is decelerated so that a loop is formed in the paper between the 2nd transfer roller and the fusing roller.
- When the paper loop amount is large, the fusing loop sensor is unblocked, and the fusing speed is increased.
- When the paper loop amount is small, the fusing loop sensor is blocked, and the fusing speed is decreased.
- The fusing speed is increased or decreased as necessary to make sure that the paper loop amount falls within a predetermined range, thereby absorbing a difference between the fusing speed and image transfer speed.
- The fusing loop control will finish after the trailing of the paper passes the 2nd transfer roller.

## Fusing speed adjustment

- If double transferred images or brush effects occur due to inadequate paper loop before fusing, adjust the fusing speed using [Service Mode] -> [Machine] -> [Fusing transport speed].
- For detailed adjustment method, see " I.5.4.3 Fusing Transport Speed".

### 13.3.3 Fusing pressure/retraction control

- To maintain durability of the fusing belt, the fusing pressure roller is retracted *1 from the fusing belt during any time other than a print cycle. (The roller is, however, retracted during a print cycle using envelopes.) *1: The pressure roller does not completely retract from the fusing belt but is slightly pressed to the fusing belt.
- The fusing pressure roller is pressed against, and retracted from, the fusing belt by rotating the pressure cam through forward or backward rotation of the fusing pressure motor.
- The fusing pressure home sensor detects the pressure roller at its pressure position.
- The position at which the fusing pressure roller is retracted is controlled by the period of time (number of pulses) through which the fusing pressure motor is rotated
- When there is no change in the output of the fusing pressure home sensor even after the lapse of a predetermined period of time after the fusing pressure motor has started rotating, the machine determines that there is a pressure/retraction fault and displays the "Trouble code C3101: Pressure roller separation failure" message or "Trouble code C3103: Pressure roller release failure" message.

[5] [4]

| $[1]$ | Fusing belt | $[2]$ | Pressure roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Pressure lever | $[4]$ | Fusing pressure home sensor (PS38) |
| $[5]$ | Pressure cam | $[6]$ | Fusing pressure motor (M11) |
| $[7]$ | Pressure position | $[8]$ | Release position |

(1) Operation timing

| Condition |  | Pressure roller position |
| :--- | :--- | :--- |
| Warm-up | At the start of a warm-up cycle | Pressure |
| Pre-standby | At the start of the pre-standby | Pressure |
| Standby | At the start of the standby | Retraction |
| Printing | For envelopes | Retraction |
|  | For paper types other than envelopes | Pressure |
| When printing the multi jobs | When current printing is for other than <br> envelopes and the next job is for the <br> envelopes. | Pressure -> Retraction *1 |
| When current printing is for the envelopes <br> and the next job is for other than envelopes. | Retraction -> Pressure *1 |  |
| Energy save mode (lower power mode, sleep mode) | Retraction |  |
| When a malfunction or misfeed occurs | Retraction |  |
| When the fusing heater lamp is turned OFF (a door opened, a malfunction occurs, or other <br> factors.) | Stop |  |

- *1: Pressure/retraction will be conducted after the currently printed paper passes between the fusing belt and the pressure roller. The timing for the next paper to be fed will be delayed during the pressure/retraction and keep the certain period of time between feeding the papers.

### 13.3.4 Paper separation mechanism

- Paper separator claws are provided on the fusing pressure roller side and the fusing belt side in order to separate the sheet of paper reliably after the fusing process.
- Three contact type paper separator claws are installed on the fusing pressure roller side.
- Five noncontact type paper separator claws are installed on the fusing belt side.

### 13.3.5 Fusing temperature control

- Fusing temperature control uses the heating roller temperature sensor and the heating roller thermistor that detect the surface temperature of the fusing belt to turn ON or OFF the fusing heater lamp as necessary.
The fusing heater lamp when turned ON heats the fusing belt to a set temperature.

| $[1]$ | Fusing belt | $[2]$ | Pressure roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Fusing roller | $[4]$ | Fusing heater lamp assy |
| $[5]$ | Heating roller | $[6]$ | Heating roller thermistor1 (TH1) |
| $[7]$ | Heating roller thermistor2 (TH2) | $[8]$ | Heating roller temperature sensor (TEMS) * |
| $[9]$ | Heating roller thermostat (TS1) | - | - |

- *: Equipped to bizhub C368/C308/C258 only
(1) Fusing heater lamp
- The heating roller contains a fusing heater lamp assy in it. The fusing heater lamp turns ON to generate heat, which heats the heating roller and fusing belt.
- The fusing heater lamp assy consists of two heaters, each having a unique heating range different from each other.
- The fusing heater lamp1 (long) * uniformly heats the entire area of the heating roller.

## NOTE

- *: Only bizhub C458 dedicated for Japan contains both the fusing heater lamp1 (long) (FH1) and the fusing heater lamp3 (long) (FH3).
- The fusing heater lamp2 (short) heats only the central portion of the heating roller.
- The fusing heater lamp is turned ON or OFF according to the width of the paper and the surface temperature of the fusing belt.
- For a paper width of 209 mm or less, the fusing heater lamp2 is used to heat the central portion.
- For a paper width exceeding 209 mm , the surface temperature of the fusing belt is measured and the fusing heater lamp1 and the fusing heater lamp2 are alternately turned ON.

| $[1]$ | Front of machine | $[2]$ | Fusing heater lamp1 (FH1) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Fusing heater lamp2 (FH2) | $[4]$ | Rear of machine |
| $[5]$ | Heating roller thermostat (TS1) | $[6]$ | Heating roller temperature sensor (TEMS) * |
| $[7]$ | Heating roller thermistor2 (TH2) | $[8]$ | Heating roller thermistor1 (TH1) |

- *: Equipped to bizhub C368/C308/C258 only

## (2) Temperature control chart

* An example when a machine is warmed up under a normal ambient condition

| $[1]$ | Main power switch ON | $[2]$ | Warm-up control |
| :--- | :--- | :--- | :--- |
| $[3]$ | Warm-up completed | $[4]$ | Pre-standby control |
| $[5]$ | Standby control (including a countermeasure against <br> overshoot $)$ | $[6]$ | Print request |
| $[7]$ | Print control | $[8]$ | Standby |
| $[9]$ | Low power mode | $[10]$ | Entry in sleep mode |
| $[11]$ | Sleep mode | $[12]$ | Fusing belt temperature |
| $[13]$ | Temperature | $[14]$ | Time |

## (3) Fusing temperature control during warm-up

- To prevent image fixability from being degraded due to environmental changes when the main power switch is turned ON, three different warm-up modes are incorporated for fusing temperature control.
- The warm-up mode is performed "at low temperatures", "at ordinary temperatures", or "under high humidity condition".
- In the warm-up mode under high humidity condition, the warm-up time is extended to prevent paper from curling and the difference in temperature between the fusing belt and fusing pressure roller is minimized.
- When the temperature of the fusing belt reaches the warm-up completion temperature, control is passed onto the pre-standby process.

| Warm up mode |  | Environment |  |
| :--- | :--- | :--- | :---: |
|  | Machine interior temperature | Machine interior humidity (absolute humidity |  |
| *1) |  |  |  |

- *1: Absolute humidity: water content contained in the air (1 m3) as steam regardless of the temperature

| $[1]$ | Machine interior temperature $18^{\circ} \mathrm{C}$ or less | $[2]$ | Machine interior temperature exceeding $18^{\circ} \mathrm{C}$ |
| :--- | :--- | :--- | :--- |
| $[3]$ | Absolute humidity, specified value or more | $[4]$ | Absolute humidity, less than the specified value |
| $[5]$ | Warm-up at low temperatures | $[6]$ | Warm-up under high humidity condition |
| $[7]$ | Warm-up at ordinary temperatures | - | - |

## (4) Temperature control during pre-standby

- After the warm-up completion temperature is reached, control is then passed onto the pre-standby process.
- The temperature control in the pre-standby state turns ON or OFF the fusing heater lamp as necessary in order to maintain the fusing belt temperature at a level that enables printing.
- A print job, when received during the pre-standby state, can be started without waiting.

## (5) Temperature control during stand-by

- If no print request is received after the temperature control in the pre-standby state is started, control is passed onto the standby process.
- The temperature control in the standby state maintains the fusing belt temperature at a level lower than the temperature that enables printing.
- The control is intended to shorten time it takes the temperature to reach the printable level when a print request is received.
- An overshoot preventive process may be performed before control is passed onto the temperature control in the standby state.
- The fusing motor repeats rotating (at low speed) and stopping for 30 minutes after the standby starts.

After the $30-\mathrm{min}$. period, the fusing motor is deenergized.

## (6) Temperature control during the print cycle

(a) Temperature control

- The machine enters a print state as it receives a print control and carries out a print cycle at a set temperature corresponding to the type of paper selected for the job.
- The fusing temperature is measured during the print cycle and temperature control suitable for the print condition is performed accordingly.

## (7) Energy save mode

- The machine enters the energy save mode from any standby state to thereby reduce power consumption (TEC value).
- The energy save mode may be either the low power mode or sleep mode, whichever is enabled depending on the set conditions. NOTE
TEC value (Typical Electricity Consumption):
- Energy saving criteria for copiers and printers to comply with the Energy Start program.
- Power consumption ( kWh ) at the office assuming operation of a product for one week ( 5 working days + 2 holidays) is calculated from the print speed and power consumption of the product.
(a) Temperature control during low power mode
- To reduce power consumption in the low power mode, the surface temperature of the fusing belt is made lower than the controlled temperature under "temperature control during the standby state".
- In the low power mode, the printable temperature can be recovered within a period of time shorter than warm-up.

## (b) Temperature control during sleep mode

- To reduce power consumption during the sleep mode, power to the fusing heater lamp is shut down to stop heating the fusing belt.
- If the fusing belt temperature is decreased to room temperature, the printable temperature can be recovered within the same period of time as that of warm-up.

## (8) Fusing-related control

- The following types of control are available as they relate to fusing temperature:
- For detailed setting method, see each item.
(a) Service Mode
- [Machine/Fusing Temperature]
- [Machine/Heater Control Level].
- [System 1/Warmup]
- [System 2/Smart Fusing Control]
(b) Enhanced Security
- [Engine FW DipSW / No. 5 Choice of high humidity circumstance]
- [Engine FW DipSW / No. 13 Choice of securing fusibility]

### 13.3.6 Plain paper fusing temperature control

- Two different target temperatures control the printing on plain paper.

| Basis weight | Specific controls |
| :--- | :--- |
| Plain paper $\left(60 \mathrm{~g} / \mathrm{m}^{2}-70 \mathrm{~g} /\right.$ <br> $\left.\mathrm{m}^{2}\right)$ | The base weight is limited to $60 \mathrm{~g} / \mathrm{m}^{2}-70 \mathrm{~g} / \mathrm{m}^{2}$. Power consumption (TEC value) is controlled through lowering the <br> target temperature to lower than the normal fusing temperature. |
| Plain paper $\left(60 \mathrm{~g} / \mathrm{m}^{2}-90 \mathrm{~g} /\right.$ <br> $\left.\mathrm{m}^{2}\right)$ | The normal target temperature controls the fusing temperature control of plain paper. |

(1) Setting procedure

Example of display

1. Select [Paper] on the basic screen.
2. Select your desired paper feed port and tap [Change Tray Setting].
3. Select [Plain Paper] and tap [Alter Paper Thickness] to select "Plain Paper ( $60 \mathrm{~g} / \mathrm{m} 2-70 \mathrm{~g} / \mathrm{m} 2)$ ". A "check mark" will be displayed in the check box of the [Alter Paper Thickness] key.
4. Tap the [Alter Paper Thickness] key again to select "Plain Paper ( $60 \mathrm{~g} / \mathrm{m} 2-90 \mathrm{~g} / \mathrm{m} 2$ )". The "check mark" in the check box of the [Alter Paper Thickness] key will disappear.

## NOTE

. "Plain Paper ( $60 \mathrm{~g} / \mathrm{m} 2$ to $70 \mathrm{~g} / \mathrm{m} 2$ )" is specified by default only for Japan.

- You can only use the [Alter Paper Thickness] key for plain paper.

### 13.3.7 Smart fusing control

- Lower the target temperature as much as possible according to the information of each sheet of paper to control the fusing temperature adjustment. In this way, the power consumption (TEC value) is controlled.
- Smart fusing control is only performed when the execution conditions below are met.
- If these execution conditions are not met, the normal fusing temperature control is performed
- Smart fusing control can also prohibit control execution from [Service Mode] -> [System 2] -> [Smart Fusing Control]. For details on how to configure the settings, see "I.5.16.35 Smart Fusing Control".

## (1) Smart fusing control execution conditions

| Function | Execution conditions |  |
| :--- | :--- | :--- |
| Temp-Inside | $10^{\circ} \mathrm{C}$ and above |  |
| Print mode | Print zoom | Only for PC printing, BOX printing, and direct printing (USB)*1 |
| Basic Settings | Paper type | Only $100 \%$ |
|  | Combination | Plain paper only |
|  | Image shift | 1 in 1 only |
|  | Cover sheet | No |
|  | Back cover | No |
|  | Inter sheet | No |
|  | OHP interleave | No |

| Function |  | Execution conditions |
| :---: | :---: | :---: |
|  | Booklet | No |
| Image quality | Select color | Black mode only |
|  | Gloss mode | No |
|  | Toner save (density 50\%) | No |
|  | Edge enhancement | No |
|  | Negative-positive reversal | No |
|  | Maximum black density | 80\% or more to 90\% or less |
|  | Line width | 1.5pt or less |
|  | Character decoration | Normal characters only*2 |
|  | Character size | 16pt or less |
|  | Image object | No |
| Stamp/page printing | No watermarks | No |
|  | No overlay | No |
|  | No copy security | No |
|  | No header/footer | No |
|  | No management number | No |

- *1: Copies are not included in the control
- *2: Bold characters are not included in the control

### 13.3.8 Protection from abnormal temperatures

## (1) First approach: software protection

- If the heating roller temperature sensor detects a predetermined temperature or more continuously, the temperature is determined to be abnormally high and a "trouble code C3725: Fusing abnormally high temperature detection (Main of the heating side)" will be displayed.
- If the heating roller thermistor1 detects a predetermined temperature or more continuously, the temperature is determined to be abnormally high and a "trouble code C3722: Fusing abnormally high temperature detection (Edge of the heating side)" will be displayed.
- If the heating roller thermistor2 detects a predetermined temperature or more continuously, the temperature is determined to be abnormally high and a "trouble code C3726: Fusing abnormally high temperature detection (Center of the heating side)" will be displayed.
- When the trouble code is displayed, printing will be prohibited.

## (2) Second approach: hardware protection

- A different protection is provided when the CPU overruns, becoming unable to detect the malfunction of an abnormally high temperature. If the heating roller temperature sensor detects an abnormal temperature, the heater relay of the DC power supply is turned OFF through the MFP board. Power supply to the fusing heater lamp is then shut down.
- When the hardware circuit in the MFP board detects the heater relay being OFF, the temperature is judged to be abnormally high. Trouble code C3731: Fusing abnormally high temperature detection (Hard protector) will be displayed.
- Through these control procedures, the power supply to the heater lamps can be shut down before the thermostat is activated. It thereby suppresses damage to the fusing unit itself.
(3) Third approach: thermostat protection
- If detection of the abnormally high temperature through approaches 1 and 2 above is not possible due to a defective the heating roller temperature sensor, heating roller thermistor or other reason, the thermostat comes into play to shut down the power supply to the heater lamp.

### 13.3.9 Fusing PPM control

## (1) PPM control

- To achieve the intended level of fixability of printed images, the PPM control reduces the number of printed pages per minute by widening the distance between sheets of paper.

| PPM mode | Control execution <br> conditions | Purpose | Specific controls | Print productivity *1 |
| :--- | :--- | :--- | :--- | :--- |
| Low temperature <br> environment mode | Room temperature at the <br> start of the print cycle is <br> $18^{\circ} \mathrm{C}$ or less | To achieve the intended <br> level of fixability under low <br> temperature environment | To prevent fixability from <br> being degraded in a multi- <br> print cycle, paper-to-paper <br> distance is widened to <br> thereby limit a decrease in <br> the fusing temperature. | $100 \%$ : default value <br> $90 \%$ <br> $80 \%$ <br> $70 \%$ <br> $60 \%$ <br> $50 \%$ |
| High humidity environment <br> mode *2 | Environmental humidity at <br> the start of the print cycle <br> is a predetermined value or <br> more | To suppress occurrence of <br> paper curl under high <br> humidity environment | Paper-to-paper distance is <br> widened in a multi-print <br> cycle run under high <br> humidity environment so <br> as to prevent paper from <br> curling, thereby achieving <br> a required fusing <br> temperature. | $100 \%$ : default value <br> $70 \%$ <br> $50 \%$ |

| PPM mode | Control execution conditions | Purpose | Specific controls | Print productivity *1 |
| :---: | :---: | :---: | :---: | :---: |
| Paper curl suppression mode | "Mode 3" is selected for "Change Warm Up Time" of the service mode | To suppress occurrence of paper curl under conditions other than high humidity environment | Paper-to-paper distance is widened in a multi-print cycle run under any condition other than high humidity environment so as to prevent paper from curling, thereby achieving a required fusing temperature. | $100 \%$ : default value 50\% |
| Heating roller end temperature rise suppression mode | - Print request is received for paper with a paper width of 209 mm or less <br> - Temperature of the heating roller ends becomes a predetermined value or more | To suppress inordinate rise in temperature on heating roller ends in a print cycle using paper of a small size | Paper-to-paper distance is widened in a multi-print cycle so as to prevent the temperature on ends of the heating roller from increasing, thereby promoting reduction in temperature. | $100 \%$ : default value $90 \%$ $80 \%$ $70 \%$ $60 \%$ $50 \%$ $40 \%$ $30 \%$ |
| Reduced power supply mode | Only an insufficient power is supplied to the fusing heater lamp, resulting in a fusing temperature lower than a predetermined value | To achieve the intended level of fixability under low power supply condition | To prevent fixability from being degraded in a multiprint cycle, paper-to-paper distance is widened to thereby limit a decrease in the fusing temperature. | $70 \%$ : default value 50\% |
| Thin paper mode | " $100 \%$ " is selected for "PPM Control Choice" of the service mode | To increase the print productivity of thin paper and recycled paper. To increase productivity during printing using thin paper. <br> * The choice of $100 \%$ may result in paper curling. | Paper-to-paper distance is narrowed to thereby increase productivity. | $\begin{aligned} & \text { 100\% } \\ & 70 \% \text { : default value *3 } \end{aligned}$ |

- *1: Exemplary calculation of print speed: If 36 ppm can be achieved at a print productivity of $100 \%$ on A4 plain paper, a change in print productivity to $90 \%$ results in 32.4 ppm .
- *2: Execution of the control for the high humidity environment mode can be prohibited when "No. 5 PPM control (high humidity environment mode) prohibited" is turned ON in [Service Mode] -> [Enhanced Security] -> [Engine FW DIP SW].
- *3: For recycled paper, the print productivity will be set to $70 \%$ when "Mode 3 " is selected for warm-up choice. For thin paper, the print productivity will be set to $70 \%$ regardless of the mode setting for warm-up choice.

### 13.3.10 Fusing unit new article detection

- The fusing unit is not provided with any new article detection mechanism. If the fusing unit is replaced with a new one, therefore, "New Release" of "Fusing Unit" must be performed in [Counter] -> [Life] of the Service Mode.

## NOTE

- For the life of the fusing unit, refer to F.6.1 Consumable/part replacement time (bizhub C368/C308/C258) and F.6.2 Consumable/ part replacement time (bizhub C658/C558/C458).

### 14.3 Operation

### 14.3.1 Heating roller assy heating control

## (1) Heating control

- The heating roller assy consists of the fusing belt (cylindrical shape) into which the fusing roller is inserted.
- The inside surface of the fusing belt is formed with Ni layer and Cu layer.
- The IH coil unit located beside the heating roller assy radiates magnetic flux to the fusing belt when energized.
- The IH coil unit consists of two different types of coil: main coil and demagnetization coil.
- The fusing belt is heated by the main coil. The demagnetization coil controls the heating zone.
- Ni layer and Cu layer of the fusing belt is the conducting layer in which eddy current is generated with magnetic flux. The eddy current generated in the conducting layer produces Joule heat to heat the heating roller.
- The main coil is provided only on one side of the heating roller assy, so that the heating roller generates heat from a local surface of the fusing belt close to the main coil. The heating roller assy is therefore rotated to ensure that the entire periphery of the roller is heated to an adequate temperature
- The heating roller temperature sensor and heating roller thermistor1 to 3 measure the temperature of the fusing belt.

| $[1]$ | Heating roller assy | $[2]$ | Fusing roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Ni layer and Cu layer (coated back side) | $[4]$ | Fusing belt |
| $[5]$ | Demagnetization coil | $[6]$ | Main coil |
| $[7]$ | IH coil unit | $[8]$ | Fusing unit |

## (2) Whole area heating control

- During printing, the whole area of the fusing belt is heated by the main coil.

## (3) Center heating switch control

- The temperature on ends of the fusing belt is measured with the heating roller thermistor1.
- When the temperature of ends of the fusing belt exceeds a predetermined value during printing using paper of a small size or in the standby state, the demagnetization coil comes into play in inhibiting heating of roller ends and only the center portion of the roller is heated.
- When the demagnetization coil is energized, the magnetic flux from the main coil is cancelled by the repulsive magnetic flux induced from the demagnetization coil. When the magnetic flux at the ends of the roller is canceled, heating of the ends of the roller can be controlled.
- The IH coil unit is provided with one type of demagnetization coil.
- The ON/OFF control of the demagnetization coil is performed depending on the paper width (CD: main scanning length), the temperature on sides of the fusing belt, and the type of paper to be fed.

[1] Demagnetization coil $\quad$ [2] Main coil

## (4) Detection of rotation of the heating roller assy

- The heating roller assy is rotated while it is being heated to ensure that the entire periphery of the fusing belt reaches an adequate temperature.
- If the heating roller assy does not rotate while the IH coil unit (main coil) is energized, the temperature of the entire periphery of the fusing belt cannot be measured and thus proper temperature control cannot be provided. At this time, only the half surface of the fusing belt is heated. If the main coil is energized with the heating roller assy remaining stationary, the roller can be damaged.
- Rotation of the heating roller results in the cylinder actuator being rotated.
- As the heating roller rotation sensor alternates between unblocked and blocked states at regular intervals, the machine determines that the heating roller assy is rotating.
- If the heating roller rotation sensor remains unblocked or blocked for a predetermined period of time during printing, the machine determines that a paper misfeed occurs at the exit, displaying a corresponding message on the control panel.
- If the heating roller rotation sensor remains unblocked or blocked for a predetermined period of time during a warm-up cycle, standby state, or any other timing than a print cycle, the machine displays the malfunction code "C3102: Heating roller failure to turn" on the control panel.

[2]

| $[1]$ | Heating roller rotation sensor (PS37) | $[2]$ | Cylinder actuator |
| :--- | :--- | :--- | :--- |
| $[3]$ | Heating roller assy | - | - |

### 14.3.2 Fusing drive release mechanism

- At the fusing drive position, transmit the driving force of the fusing motor to the fusing pressure roller by a fusing drive release gear.
- Opening the right door places the fusing drive release lever in the fusing drive release position.
- With the fusing drive release lever in the fusing drive release position, the fusing drive release gear is disconnected from the fusing motor and, instead, connected to the jam removal dial.
- If a paper misfeed occurs in the fusing section, opening the right door allows the jam removal dial to be used for removing the misfed paper.
[1]

| $[1]$ | Fusing drive position | $[2]$ | Fusing motor (M3) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Fusing drive release gear | $[4]$ | Fusing drive release lever |
| $[5]$ | Right door close position | $[6]$ | Connected to fusing motor |
| $[7]$ | Fusing pressure roller | $[8]$ | Fusing drive release position |
| $[9]$ | Jam removal dial | $[10]$ | Connected to jam removal dial |
| $[11]$ | Right door open position | - | - |

### 14.3.3 Fusing speed correction

(1) Fusing loop control

- To prevent double transferred images and brush effects that occur due to a difference in speed between paper transport during image transfer and fusing, a loop is formed in the paper between the 2nd transfer and fusing sections.
- The fusing loop sensor detects the length of the loop formed in the paper between the $2 n d$ transfer section and the fusing pressure roller.
- The fusing motor increases or decreases the fusing speed according to the length of loop in the paper, thereby ensuring that the length of loop falls within a predetermined range.

| Fusing loop sensor | Loop amount | Fussing speed |
| :---: | :---: | :---: |
| Unblocking | Large | Speed-up |
| Blocking | Small | Slowdown |

| $[1]$ | Loop amount: large | $[2]$ | Actuator |
| :--- | :--- | :--- | :--- |
| $[3]$ | Fusing loop sensor (PS2) | $[4]$ | 2nd transfer roller |
| $[5]$ | Loop amount: small | $[6]$ | Fusing pressure roller |

## (a) Operation timing

- It starts controlling when the front-edge of the paper reaches to the predetermined position before the fusing roller.
- The fusing speed is decelerated so that a loop is formed in the paper between the 2nd transfer roller and the fusing roller.
- When the paper loop amount is large, the fusing loop sensor is unblocked, and the fusing speed is increased.
- When the paper loop amount is small, the fusing loop sensor is blocked, and the fusing speed is decreased.
- The fusing speed is increased or decreased as necessary to make sure that the paper loop amount falls within a predetermined range, thereby absorbing a difference between the fusing speed and image transfer speed.
- The fusing loop control will finish after the trailing of the paper passes the 2nd transfer roller.
(b) Fusing speed adjustment
- If double transferred images or brush effects occur due to inadequate paper loop before fusing, adjust the fusing speed using [Service Mode] -> [Machine] -> [Fusing transport speed].

### 14.3.4 Fusing pressure/retraction control

- To maintain durability of the fusing belt, the fusing pressure roller is retracted *1 from the fusing belt during any time other than a print cycle. (The roller is, however, retracted during a print cycle using envelopes.)
*1: The fusing pressure roller does not completely retract from the fusing belt but is slightly pressed to the fusing belt.
- The fusing pressure roller is pressed against, and retracted from, the fusing belt by rotating the pressure cam through forward or backward rotation of the fusing pressure motor.
- The fusing pressure home sensor detects the fusing pressure roller at its pressure position.
- The position at which the fusing pressure roller is retracted is controlled by the period of time (number of pulses) through which the fusing pressure motor is rotated.
- When there is no change in the output of the fusing pressure home sensor even after the lapse of a predetermined period of time after the fusing pressure motor has started rotating, the machine determines that there is a pressure/retraction fault and displays the "Trouble code C3101: Fusing roller separation failure" message.

| $[1]$ | Fusing belt | $[2]$ | Fusing pressure roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Pressure lever | $[4]$ | Fusing pressure home sensor (PS38) |
| $[5]$ | Pressure cam | $[6]$ | Fusing pressure motor (M11) |
| $[7]$ | Pressure position | $[8]$ | Release position |

(1) Operation timing

| Condition |  | Fusing pressure roller position |
| :--- | :--- | :--- |
| Warm-up | At the start of a warm-up cycle | Retraction (bizhub C558) |
|  |  | Retraction and pressure (bizhub C658) |
| Pre-standby | At the start of the pre-standby | Pressure |
| Standby | At the start of the standby | Retraction |
| Printing | For envelopes | Retraction |
|  | For paper types other than envelopes | Pressure |
| When printing the multi jobs | When current printing is for other than <br> envelopes and the next job is for the <br> envelopes. | Pressure -> Retraction *1 |
|  | When current printing is for the envelopes <br> and the next job is for other than envelopes. | Retraction -> Pressure *1 |
| Energy save mode (lower power mode, sleep mode) | Retraction |  |
| When a malfunction or misfeed occurs | Retraction |  |
| When the fusing heater lamp is turned OFF (a door opened, a malfunction occurs, or other <br> factors.) | Stop |  |

- *1: Pressure/retraction will be conducted after the currently printed paper passes between the fusing belt and the fusing pressure roller. The timing for the next paper to be fed will be delayed during the pressure/retraction and keep the certain period of time between feeding the papers.

### 14.3.5 Soaking roller pressurization/release control

- The cleaning roller collects paper dust and toner that has adhered to the fusing pressure roller via the soaking roller. However, sometimes not all paper dust or toner is collected from the fusing pressure roller when the fusing pressure roller and soaking roller are always pressurized.
- A pressurization/release mechanism has been provided to the soaking roller to prevent the fusing pressure roller from becoming dirty.
- The soaking roller pressurization/release control releases the roller at start of printing, and pressurizes the soaking roller at end of printing.
- The release lever operates when the soaking roller pressure solenoid is turned ON to separate the soaking roller.

### 14.3.6 Fusing paper transport control

- The 2nd transfer roller transports paper onto the fusing unit.
- The fusing unit uses the fusing motor to drive the fusing pressure roller, thereby transporting paper onto the exit/reverse section.
- Fusing motor speed control is completed before the paper enters the fusing unit.
- The paper fed into the paper exit/reverse section is detected by the paper exit sensor before being transported by the paper exit roller.
- The fusing motor is deenergized after the last sheet of paper is fed into the finisher or out into the exit tray.

| $[1]$ | Actuator | $[2]$ | Paper exit sensor (PS3) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Fusing pressure roller | $[4]$ | 2nd transfer roller |
| $[5]$ | Fusing roller | $[6]$ | Exit tray front roller |
| $[7]$ | Exit roller | - | - |

### 14.3.7 Paper separation mechanism

- Paper separator claws are provided on the fusing pressure roller side and the fusing belt side in order to separate the sheet of paper reliably after the fusing process.
- Three contact type paper separator claws are installed on the fusing pressure roller side.
- Five noncontact type paper separator claws are installed on the fusing belt side.

| $[1]$ | Fusing belt | $[2]$ | Paper separator claws (noncontact type) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper separator claws (contact type) | $[4]$ | Fusing pressure roller |

### 14.3.8 Fusing temperature control

- The surface temperature of the fusing belt is detected to control the amount of the heat of the IH coil in order to maintain the appropriate fusing temperature.

| $[1]$ | Heating roller assy | $[2]$ | Fusing pressure roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Soaking roller | $[4]$ | Heating roller rotation sensor (PS37) |
| $[5]$ | Fusing pressure home sensor (PS38) | $[6]$ | Heating roller thermistor1 (TH1) |
| $[7]$ | Heating roller thermostat (TS1) | $[8]$ | Heating roller thermistor3 (TH3) |
| $[9]$ | Heating roller temperature sensor1 (TEMS/1) (Fixed at the <br> main body) | $[10]$ | Heating roller thermistor2 (TH2) |
| $[11]$ | Heating roller temperature sensor2 (TEMS/2) (Fixed at the <br> main body) * | - | - |

- *: Equipped to bizhub C658 only

## (1) Temperature control chart

| $[1]$ | Main power switch ON | $[2]$ | Warm-up |
| :--- | :--- | :--- | :--- |
| $[3]$ | Print is available | $[4]$ | Pre-standby (3 seconds) |
| $[5]$ | Standby | $[6]$ | Start key ON |
| $[7]$ | Printing (plain/color) | $[8]$ | End of print |
| $[9]$ | Standby | $[10]$ | Start of low power mode |
| $[11]$ | Low power mode | $[12]$ | Start of sleep mode |
| $[13]$ | Sleep mode | $[14]$ | Temperature |
| $[15]$ | Time | - | - |

## (2) IH coil control

- Electric energy of the IH coil is controlled so that the temperature of the fusing belt falls within a predetermined temperature range.
- The temperature of the fusing belt is measured with the heating roller temperature sensor to thereby determine a possible change in the temperature (increase or decrease).
- The following types of control are available for the control of the electric energy of the IH coil.

1. Fixed control: The electric energy of the IH coil is controlled with a predetermined value; the control is performed for temperature control during warm-up.
2. PID control: The electric energy of the IH coil is controlled through a combination of the P control, I control, and D control; Used for temperature control in the normal standby state, during a print cycle, and in the low power mode
3. P control: The electric energy of the IH coil is controlled according to the difference between a target temperature and a detected temperature; used for temperature control in the printing, standby, low power, pre-standby state, and before printing.
4. I control: Temperature errors arising from individual variability in the IH coil and fusing unit are corrected; not to be performed individually.
5. D control: The electric energy of the IH coil is corrected to respond to sudden changes in temperature; not to be performed individually.

## (3) Fusing temperature control during warm-up

- To prevent image fixability from being degraded due to environmental changes when the main power switch is turned ON, three different warm-up modes are incorporated for fusing temperature control.
- The warm-up mode is performed "at low temperatures", "at ordinary temperatures", or "under high humidity condition".
- In the warm-up mode under high humidity condition, the warm-up time is extended to prevent paper from curling and the difference in temperature between the fusing belt and fusing pressure roller is minimized
- When the temperature of the fusing belt reaches the warm-up completion temperature, control is passed onto the pre-standby process.
- Printing then starts if there is a print request. The system transitions to the pre-standby temperature control if there is no print request.
- If the fusing pressure roller is pressed, the fusing pressure motor turns on to release the fusing pressure roller.

| Warm up mode |  | Environment |  |
| :--- | :--- | :--- | :---: |
|  | Paper temperature | Machine interior humidity (absolute humidity |  |
| ${ }^{*} 1$ ) |  |  |  |

- *1: Absolute humidity: water content contained in the air (1 m 3 ) as steam regardless of the temperature

| $[1]$ | Machine interior paper temperature $18^{\circ} \mathrm{C}$ or less | $[2]$ | Machine interior paper temperature exceeding $18^{\circ} \mathrm{C}$ |
| :--- | :--- | :--- | :--- |
| $[3]$ | Absolute humidity, specified value or more | $[4]$ | Absolute humidity, less than the specified value |
| $[5]$ | Warm-up at low temperatures | $[6]$ | Warm-up under high humidity condition |
| $[7]$ | Warm-up at ordinary temperatures | - | - |

## (4) Temperature control during stand-by

- If no print request is received after the temperature control in the pre-standby state is started, control is passed onto the standby process.
- When a predetermined amount of time elapses after the pre-standby control starts, temperature control is performed through standby control
- Within a specified time after standby temperature control starts, the target temperature is maintained for each mode in low-temperature, normal, and high-humid state
- The standby temperature control ensures that the temperature of fusing belt in the standby state is not decreased.
* Counted period for standby control includes the printing time.

## (5) Temperature control during the print cycle

- Temperature control is provided in order to keep optimum fusing performance with various factors, such as the type of paper, print mode, paper temperature*1, use of paper of small size, decreased temperature during paper passage, and warm-up carried out with a cool fusing unit.
- *1: The paper temperature is used as data to control the fusing temperature. The paper temperature sensor that is installed in the paper feed section measures this temperature as the "Internal paper feed section temperature".
(6) Temperature control under low power mode
- The temperature of the fusing belt is decreased to thereby reduce power consumption during the low power mode.
- When the fusing pressure roller is in the pressed state, the fusing pressure motor turns ON to release the pressure.
- The heating roller assy is rotated by the fusing motor at the same time that the IH coil is energized and stopped when the IH coil is deenergized. The speed of the heating roller assy at this time is lower than that during a print cycle. The rotation speed at this time is lower than the rotation speed used for printing.
- When the temperature of the fusing belt is decreased to the starting temperature of the low power mode temperature control, the IH coil and the fusing motor are energized; when the temperature exceeds the ending temperature, the IH coil and the fusing motor are deenergized.
- During the low power mode, ON/OFF control is repeated between the starting and ending temperatures of the low power consumption control.

## 7) Temperature control in sleep mode

- The main coil and demagnetization coil are deenergized to stop heating the fusing belt, thereby reducing power consumption in the sleep mode.
- When the fusing motor stops running, all rollers will stop rotating
- Sleep mode includes two types of control, which is determined depending on the time that has elapsed since printing has completed. This control includes the engine ON sleep and the engine OFF sleep control.
- Engine ON sleep control is used when a sleep mode start instruction is received less than 1 minute after a printing has completed - Any running fans continue driving, but fusing temperature control is stopped.
- Engine OFF sleep control is used when a sleep mode start instruction is received 1 minute or more after a printing has completed.
- In the sleep mode, the fusing belt temperature may be decreased down to room temperature because the fusing belt is not heated. A maximum time equivalent to the warm-up time may be required before the fusing belt temperature is increased to the print enable temperature from the room temperature.

### 14.3.9 Protection from abnormal temperatures

- The machine provides protection against abnormally high temperature of the fusing unit in the following three steps.

## (1) Soft protection

- When the temperature higher than the control range at heating roller assy is detected more than 1 second, the temperature is judged to be abnormally high, and the trouble code appears
- When the trouble code is displayed, printing will be prohibited.

| Roller name | Sensor name: symbol | Trouble code |  |
| :--- | :--- | :--- | :--- |
| Heating roller assy | Heating roller temperature sensor: TEMS | C3725 | Fusing abnormally high temperature detection <br> (Center of the heating side) |
|  | Heating roller thermistor2: TH2 | C3726 | Fusing abnormally high temperature detection <br> (Middle of the heating side) |
|  | Heating roller thermistor1: TH1 | C3722 | Fusing abnormally high temperature detection <br> (Edge of the heating side) |

## (2) Hard protection

- Next level is provided when the level 1 cannot detect due to CPU overrun.
- The heater relay, through the printer control board, is turned OFF in the second level operation to block the power supply to the IH coil.
- When the controlled temperature of heating roller assy is detected higher than the predetermined value, the temperature is judged to be abnormally high, and the trouble code appears.
- Through these control procedures, the power supply to the IH coil can be shut down before the thermostat is activated in the third level. It thereby suppresses damage to the fusing unit itself.

| Roller name | Sensor name: symbol | Trouble code |  |
| :---: | :--- | :---: | :--- |
| Heating roller assy | Heating roller temperature sensor: TEMS2 | C3725 | Fusing abnormally high temperature detection <br> (Center of the heating side) |
|  | Heating roller thermistor1: TH1 | C3726 | Fusing abnormally high temperature detection <br> (Middle of the heating side) |
|  | Heating roller thermistor2: TH2 | C3722 | Fusing abnormally high temperature detection <br> (Edge of the heating side) |
|  | Heating roller thermistor3: TH3 |  |  |

## (3) Excessive rise protection

- If the abnormal high temperature of soft protection/hard protection cannot be detected due to a faulty temperature sensor or thermistor, thermostat blocks the power supply to the IH coil.
- The thermostat rating is 210 degrees centigrade for the heating roller thermostat. The ratings do not, represent the actual surface temperature of the fusing belt, since the thermostats are installed in a non-contact with respect to heating roller assy.

### 14.3.10 IH power supply control

(1) IH power supply abnormal temperature detection

- The IH power supply unit includes a temperature fuse. This fuse prevents IH power supply troubles due to increased unit internal temperature.
- The IH power supply unit includes a thermistor for monitoring the unit internal temperature. Control starts to lower the temperature when the unit internal temperature has increased.
- Details of high temperature detection control

| Fault name | Mode | Control contents | Code |  |
| :--- | :--- | :--- | :--- | :---: |
| High <br> temperature 1 | Printing | Productivity decreases from $100 \%$ to $50 \%$. | Do Not Display |  |
|  |  | Productivity returns to $100 \%$ when a temperature of 90 degree is <br> detected for at least 30 seconds. |  |  |
|  |  |  |  |  |

| Fault name | Mode | Control contents |  | Code |
| :---: | :---: | :---: | :---: | :---: |
|  | Standby | The rotation speed of the IH power supply cooling fan is increased from 50\% to 100\%. |  |  |
|  |  | The speed returns to $50 \%$ when a temperature of 90 degree is detected for at least 30 seconds. |  |  |
| High temperature 2 | All modes | A trouble code appears. | C3B02 | IH malfunction (CPU) |

## (2) Abnormal power supply input detection

- The IH power supply unit reduces power to the IH coil when the voltage input into the IH power supply has decreased. When capacity of fusing cannot be maintained due to reduced IH coil power, PPM control is implemented to reduce print productivity from $100 \%$ to $40 \%$ in stages.
- The IH power supply unit displays a trouble code when the input power or voltage values are abnormal.

| Fault name | Detection method | Control contents | Code |  |
| :---: | :---: | :---: | :---: | :---: |
| Input power abnormal | Input current or power has exceeded the upper limit value. | A trouble code appears. | C3B07 | IH input power error |
|  | Input current or power has fallen below the lower limit value. |  |  |  |
| Input voltage abnormal | The input voltage has exceeded the upper limit value. | A trouble code appears. | C3B08 | IH input voltageerror |
|  | The input voltage has fallen below the lower limit value. |  |  |  |

### 14.3.11 Temperature sensor control

- A non-contact type thermopile sensor is used for heating roller temperature sensor (hereinafter referred to as "temperature sensor"). The temperature sensor detects the temperature of the fusing belt through infrared rays and controls the surface temperature.
- The temperature sensor is provided with a lens. For its structural reason, therefore, the temperature sensor can be dirtied by dew condensation formed or foreign matter deposited on the lens.
- The temperature sensor, if contaminated with dew drops or dirt on the lens, becomes unable to detect the temperature accurately, since the contaminants blocks the infrared rays that are otherwise detected by the sensor.
- If temperature control is provided under such conditions, the temperature sensor detects a temperature that is lower than the actual temperature of the fusing belt. Then, the fusing belt temperature is controlled based on a temperature higher than the target one.

## (1) Detection of condensation on the heating roller temperature sensor

- The control of detection of condensation on the heating roller temperature sensor is to determine degradation of detection accuracy of the temperature sensor caused by condensation or dirt.
- When the difference in temperature between that detected by heating roller thermistor3 and that detected by heating roller temperature sensor is equal to, or more than, a specified value and that condition lasts for predetermined period of time or more, the machine determines that the heating roller temperature sensor lens has condensation on it.
- When condensation on the temperature sensor is detected and the control is switched to "alternative temperature control", the machine displays the corresponding P code " $\mathrm{P}-32$ Heating roller temperature sensor temperature detection failure" on the control panel.

## (2) Detection of contamination on the heating roller temperature sensor

- The contamination detection control is to determine degradation of detection accuracy of the heating roller temperature sensor caused by contamination.
- The contamination detection control is performed only in the standby state. No control is provided during the alternative temperature control initiated by condensation of the temperature sensor.
- If contamination of the lens of the heating roller temperature sensor is detected, the machine displays the corresponding malfunction code "C-392A heating roller temperature sensor contamination (Main of the heating roller)" on the control panel. It then shuts down the circuit to the main coil and terminates fusing unit temperature control.
- If, after the start of the contamination detection control, the difference in temperature between that detected by heating roller thermistor3 and that detected by heating roller temperature sensor is equal to, or more than, a specified value and that condition lasts for 10 min. or more, the machine determines that the heating roller temperature sensor lens is contaminated.
- The contamination detection control is terminated if, at any timing within 10 min . after the contamination detection control has been started, the difference in temperature between that detected by heating roller thermistor/1 and that detected by heating roller temperature sensor is equal to, or less than, a specified value.
- The contamination detection control is terminated if the machine enters any mode other than the current one, including the warm-up or the low power mode as initiated by the start of a print cycle or restart.

## (3) Heating roller alternative temperature control

- If condensation on the heating roller temperature sensor is detected, the heating roller temperature control is provided based on the temperature detected by the heating roller thermistor3, instead of that detected by the heating roller temperature sensor. This control is referred to as the heating roller alternative temperature control.
- When the control is switched to the alternative temperature control, the machine displays the corresponding P code "P-32 Heating roller temperature sensor temperature detection failure" on the control panel.
- If the difference in temperature between that detected by heating roller thermistor3 and that detected by heating roller temperature sensor becomes less than a specified value during the alternative temperature control, the machine determines that condensation on the heating roller temperature sensor has been eliminated and resumes the temperature control based on the temperature detected by the heating roller temperature sensor.
- If the difference in temperature between that detected by heating roller thermistor3 and that detected by heating roller temperature sensor is not improved even after the lapse of 10 min . after the alternative temperature control has been initiated, the machine determines that the cause is not condensation, but contamination, on the lens and terminates the alternative temperature control.
- If a print job is received during the alternative temperature control, control is performed according to the settings made in "Enhanced Security" of "Service Mode". Reference: [Service Mode] -> [Enhanced Security] -> [Engine FW DipSW] -> [Switch No. 4/Fusing unit alternative temperature control]

## (4) Sensor disconnection detection control

- If the temperature of the temperature sensor or thermistor fails to reach the specified temperature in the given period after the warm-up started, the sensor is judged to have disconnection, and the trouble code will appear.

| Roller name | Sensor name: symbol | Trouble code |  |
| :---: | :--- | :---: | :--- |
| Heating roller assy | Heating roller temperature sensor: TEMS | C3925 | Fusing sensor wire breaks detection (Center of the <br> heating side) |
|  | Heating roller thermistor2: TH2 | C3926 | Fusing sensor wire breaks detection (Middle of the <br> heating side) |
|  | Heating roller thermistor1: TH1 | C3922 | Fusing sensor wire breaks detection (Edge of the <br> heating side) |

### 14.3.12 Fusing PPM control

(1) PPM control

- To achieve the intended level of fixability of printed images, the PPM control reduces the number of printed pages per minute by widening the distance between sheets of paper.

| PPM mode | Control execution conditions | Purpose | Specific controls | Print productivity *1 |
| :---: | :---: | :---: | :---: | :---: |
| Low temperature environment mode | Room temperature at the start of the print cycle is $18^{\circ} \mathrm{C}$ or less | To achieve the intended level of fixability under low temperature environment | To prevent fixability from being degraded in a multiprint cycle, paper-to-paper distance is widened to thereby limit a decrease in the fusing temperature. | $100 \%$ $90 \%$ $80 \%$ $70 \%$ : default value $60 \%$ $50 \%$ |
| High humidity environment mode *2 | Environmental humidity at the start of the print cycle is a predetermined value or more | To suppress occurrence of paper curl under high humidity environment | Paper-to-paper distance is widened in a multi-print cycle run under high humidity environment so as to prevent paper from curling, thereby achieving a required fusing temperature. | $\begin{aligned} & 100 \% \text { : default value } \\ & 70 \% \\ & 50 \% \end{aligned}$ |
| Reduced power supply mode | Only an insufficient power is supplied to the IH coil, resulting in a fusing temperature lower than a predetermined value | To achieve the intended level of fixability under low power supply condition | To prevent fixability from being degraded in a multiprint cycle, paper-to-paper distance is widened to thereby limit a decrease in the fusing temperature. | 70\%: default value 50\% |
| Thin paper mode | " $100 \%$ " is selected for "PPM Control Choice" of the service mode | To increase the print productivity of thin paper and recycled paper. To increase productivity during printing using thin paper. <br> * The choice of $100 \%$ may result in paper curling. | Paper-to-paper distance is narrowed to thereby increase productivity. | $\begin{aligned} & 100 \% \\ & 70 \% \text { : default value *4 } \end{aligned}$ |
| Low-power Support Selection *3 | Where the DipSW setting is set to "OFF" (prioritizing productivity) | To increase productivity when finishers are installed. <br> The choice of $100 \%$ may result in warm up time lengthening. | Paper-to-paper distance is narrowed to thereby increase productivity. | $\begin{aligned} & 100 \% \\ & 70 \% \text { : default value } \end{aligned}$ |

- *1: Exemplary calculation of print speed: If 55 ppm can be achieved at a print productivity of $100 \%$ on A4 plain paper, a change in print productivity to $90 \%$ results in 49.5 ppm .
- *2: Execution of the control for the high humidity environment mode can be prohibited when "No. 5 PPM control (high humidity environment mode) prohibited" is turned ON in [Service Mode] -> [Enhanced Security] -> [Engine FW DIP SW].
- *3: By setting the [Service Mode] -> [Security Selection] -> [Engine FW Dip SW] "No. 11: Low Power Support Selection" to "ON", the low power support selection can prohibit the execution of controls.
- *4: For recycled paper, the print productivity will be set to $70 \%$ when "Mode 3 " is selected for warm-up choice. For thin paper, the print productivity will be set to $70 \%$ regardless of the mode setting for warm-up choice.

### 14.3.13 Fusing unit new article detection

- The fusing unit is not provided with any new article detection mechanism. If the fusing unit is replaced with a new one, therefore, "New Release" of "Fusing Unit" must be performed in [Counter] -> [Life] of the Service Mode.
NOTE
- For the life of the fusing unit, refer to F.6.1 Consumable/part replacement time (bizhub C368/C308/C258) and F.6.2 Consumable/ part replacement time (bizhub C658/C558/C458).

| $[7]$ | Paper exit roller | $[8]$ | Reverse roller |

### 15.5 Operation

### 15.5.1 Transport control

## (1) Paper exit by paper exit roller

- If the paper is fed out by way of the paper exit roller, the paper exit roller is rotated forward to transport the paper.
- The initial position of the paper exit/reverse switch gate establishes a paper path through the paper exit roller, so that its position is not changed.
- The paper exit roller is driven by controlling rotation of the fusing motor with the paper exit clutch.
- The paper exit clutch is energized at timing at which the leading edge of the paper enters the fusing unit.
- The paper exit clutch is deenergized when the paper is fed a predetermined distance after the paper exit roller after the paper exit sensor has detected the trailing edge of the paper.

| $[1]$ | Actuator | $[2]$ | Paper exit sensor (PS3) |
| :--- | :--- | :--- | :--- |
| $[3]$ | 2nd transfer roller | $[4]$ | Fusing unit |
| $[5]$ | Transported to paper exit tray or finisher | $[6]$ | Paper exit roller |
| $[7]$ | Paper exit/reverse switch gate: solenoid OFF position | - | - |

## (2) Paper exit by reverse roller

- The paper is fed from the reverse roller to the paper exit tray, only if RU-513/JS-506 capable of feeding paper out through the reverse roller is mounted.
- When the paper is to be fed out via the reverse roller, the switchback motor is rotated forward to thereby transport the paper.
- The gate switch solenoid is energized in order to establish a paper path through the reverse roller by changing the position of the paper exit/reverse switch gate.
- The reverse roller is started at timing at which the leading edge of the paper enters the paper exit/reverse section.
- The reverse roller is stopped when the paper is fed a predetermined distance after the reverse roller after the paper exit sensor has detected the trailing edge of the paper.

| $[1]$ | Actuator | $[2]$ | Paper exit sensor (PS3) |
| :--- | :--- | :--- | :--- |
| $[3]$ | 2nd transfer roller | $[4]$ | Fusing unit |
| $[5]$ | Paper exit/reverse switch gate: solenoid ON position | $[6]$ | Paper exit to paper exit tray |
| $[7]$ | Reverse roller | - | - |

## (3) Duplex section transport

- When the paper is to be fed into the duplex section, the reverse roller is rotated forward to transport the paper to the reverse position and then rotated backward, thereby transporting the paper onto the duplex section.
- Until the paper is transported up to the reverse stop position, the gate switch solenoid is energized to place the paper exit/reverse switch gate in a position at which the paper path through the reverse roller is established.
- When the paper reaches the reverse stop position, the paper exit/reverse switch gate returns to its original position to thereby prevent the paper from moving backward into the fusing section.
- The reverse roller is started to rotate forward at timing at which the leading edge of the paper enters the paper exit/reverse section.
- The reverse roller is stopped from forward rotation at timing at which the paper reaches the reverse stop position after the paper exit sensor has detected the trailing edge of the paper.
- The reverse roller is started to rotate backward at timing at which the preceding paper moves past a predetermined position of the duplex section.
- The reverse roller is stopped from backward rotation at timing at which the trailing edge of the paper enters the duplex section

| $[1]$ | Transporting to duplex section | $[2]$ | 2nd transfer roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Fusing unit | $[4]$ | Paper exit/reverse switch gate: solenoid ON position |
| $[5]$ | Paper exit/reverse switch gate: solenoid OFF position | $[6]$ | Transporting to reverse stop position |
| $[7]$ | Reverse roller | $[8]$ | Reverse stop position |

### 15.5.2 Paper exit roller speed reduction control (C658/C558/C458)

- If the discharge speed at the same speed as process speed is too fast, paper will be discharged forcefully and unevenly in the paper exit tray.
- Speed reduction control is implemented on the paper exit roller to prevent unevenness in paper.
- The fusing motor and paper exit clutch drives the transport roller. However, drive power is transferred to the reduction gear when paper exit deceleration clutch is turned ON in the drive state to reduce transport roller speed
- The paper exit roller speed reduction control is performed only when normal paper is discharged

### 16.5 Operation

### 16.5.1 Paper transport control

- In duplex transportation, the paper transported from the reverse roller is transported to the internal duplex section by the ADU transport roller1 and ADU transport roller2
- In duplex pre-registration, the paper is conveyed to the registration roller at the vertical transport section by the ADU transport roller3 and ADU transport roller4.

## (1) Transport roller control

- The ADU transport motor drives the ADU transport roller1 and ADU transport roller2.
- The ADU transport roller3 and ADU transport roller4 are driven by controlling rotation of the transport motor with the ADU transport clutch. (bizhub C368/C308/C258)
- The ADU transport motor2 drives the ADU transport roller3 and ADU transport roller4. (bizhub C658/C558/C458)
(2) Paper entrance control (bizhub C368/C308/C258)
- The switchback motor at the paper exit/reverse section is deenergized to stop transport of the paper temporarily. (stop position 1) The switchback motor thereafter rotates in reverse to transport the paper into the duplex section.
- At the same time of backward rotation of the switchback motor, the ADU transport motor is energized and the ADU transport roller1 and ADU transport roller2 start rotating.
- The ADU paper passage sensor1 located downstream of the ADU transport roller1 detects the leading edge of the paper transported to the duplex section.
- If a preceding sheet of paper being transported through the duplex section is yet to reach a predetermined position downstream of the registration roller, the ADU transport motor is deenergized to stop transport of the paper temporarily. (stop position 2 )
- When the advanced sheet of paper moves past the specified position, ADU transport motor1 is energized to resume the transport of paper.
- If the ADU paper passage sensor2 does not detect the leading edge of the paper even after the lapse of a predetermined period of time after the ADU paper passage sensor1 has detected the leading edge of the paper, the machine determines that a paper misfeed occurs at the duplex transport part.
- When the leading edge of the paper reaches the specified position, ADU transport clutch is energized and ADU transport roller 3 and ADU transport roller 4 transports paper.
- ADU paper passage sensor2 detects the leading edge of the paper.
- When the paper moves past ADU transport roller 4 and reaches the specified position, ADU transport clutch is deenergized to stop the transport of the paper temporarily (stop position 3).

## (3) Paper entrance control (bizhub C658/C558/C458)

- The switchback motor at the paper exit section is deenergized to stop transport of the paper temporarily (stop position 1). The switchback motor thereafter rotates in reverse to transport the paper into the duplex section.
- When the switchback motor starts reverse rotation, ADU transport motor1 is energized and ADU transport roller 1 and ADU transport roller 2 transports the paper.
- The ADU paper passage sensor1 located downstream of the ADU transport roller1 detects the leading edge of the paper transported to the duplex section.
- If a preceding sheet of paper being transported through the duplex section is yet to reach a predetermined position downstream of the registration roller, the ADU transport motor1 is deenergized to stop transport of the paper temporarily. (stop position 2)
- When the advanced sheet of paper moves past the specified position, ADU transport motor1 is energized to resume the transport of paper.
- If ADU paper passage sensor2 is unable to detect the leading edge of the paper even after the lapse of a predetermined period of time after ADU paper passage sensor1 has detected the leading edge of the paper, the machine determines that a paper misfeed occurs at the duplex transport part.
- When the leading edge of the paper reaches the specified position, ADU transport motor2 is energized and ADU transport roller 3 and ADU transport roller 4 transports paper.
- ADU paper passage sensor2 detects the leading edge of the paper.
- When the paper moves past ADU transport roller 4 and reaches the specified position, ADU transport motor2 is deenergized to stop the transport of the paper temporarily (stop position 3).
(4) Duplex paper feed control
- At predetermined paper feed timing, the ADU transport clutch is energized to resume the transport of the paper. ADU transport motor1 is also energized if it has been deenergized. (bizhub C368/C308/C258)
- At predetermined paper feed timing, the ADU transport motor2 is energized to resume the transport of the paper. ADU transport motor1 is also energized if it has been deenergized. (bizhub C658/C558/C458)
- The paper is fed from ADU transport roller 4 onto the registration roller at the vertical transport part.

### 16.5.2 Duplex circulation control

- The duplex circulation control is performed differently according to the length of the paper path direction.

| Length of paper in the feed direction | Duplex circulation control |
| :---: | :---: |
| 458 mm or less | One-sheet circulation operation |
| 432 mm or less | Two-sheet circulation operation |
| 216 mm or less | Three-sheet circulation operation |

(1) One-sheet circulation operation

- After the second side is printed for each sheet, the paper is transported to the duplex pre-registration section. After the first side is printed, the paper is then discharged outside of the machine.

(2) Two-sheet circulation operation
- The sheet having the first side being printed and the sheet having the second side being printed are transported alternately.

(3) Three-sheet circulation operation
- The sheet having the first side being printed and the sheet having the second side being printed are transported alternately. A third sheet is stored in the machine during printing the other sheets.

## 17. IMAGE STABILIZATION CONTROL

### 17.1 Overview

- The machine provides the following image stabilization control to ensure stabilized copy image.

| Purpose | Control | Control means |
| :--- | :--- | :--- |
| To stabilize image density | IDC sensor adjustment control <br> To stabilize gradation <br> Max. density adjustment control <br> LD intensity adjustment control <br> Registration control (color shift correction) <br> Gamma correction control | IDC sensor <br> Temperature/humidity sensor <br> PH temperature sensor |
| To stabilize toner density | TCR control (Y, M, C, K) | TCR sensor |
| To stabilize image transfer | Transfer output control <br> Transfer ATVC | Temperature/humidity sensor |

### 17.2 Description of control

### 17.2.1 IDC sensor adjustment control

- Controls changes in characteristics due to change with time and contamination of the transfer belt and IDC sensor, part-to-part variations in the sensors, and change of environment.
- The intensity (current value) of the IDC sensor is adjusted on the surface of the transfer belt, on which no toner sticks (background level).

### 17.2.2 Max. density adjustment control

- The developing bias $(\mathrm{Vdc})$ is adjusted to control changes in the solid density resulting from variations in developing characteristics and IDC sensor intensity, variations in sensitivity of the photo conductor, and changes in the environment, durability, and the amount of charge in toner.
- Patterns are produced on the surface of the transfer belt and the IDC sensor detects the amount of toner sticking to them.
- Referring to the detected data and the environment data taken by the temperature/ humidity sensors, the developing bias value that results in the appropriate maximum density is calculated and stored in memory.
- Thereafter, the grid voltage $(\mathrm{Vg})$ value, including the background margin adjustment value, is calculated and stored in memory.

### 17.2.3 LD intensity adjustment control

- It adjusts the variation in reproducibility of the thin line and the reverse outline, which is resulting from the variations in electrostatic characteristics of the photo conductor, developing characteristics and transfer characteristics in terms of individual difference, environment and durability, to make it the target level.
- It produces detection patterns on the surface of the transfer belt with the given level of LD intensity and detects the output value of IDC sensor.
- LD intensity is calculated from the detected IDC sensor data.

### 17.2.4 Color registration control (color shift correction)

- Color shift occurs on the tandem engine including image forming units for each color, due to the variations in internal parts and mounting accuracies. The color registration control system automatically detects color shift and correct color shift in the main and sub scanning directions.
- The color shift is detected as follows. A pattern is produced at each of front and rear ends of the transfer belt. The IDC sensors at the front and rear ends read respective patterns to thereby calculate and store color shift amounts in the sub scanning and main scanning directions.
- From data readings, the machine calculates how much the position of each of the different colors should be corrected. Based on the calculated data, the machine controls each dot during image output, thereby correcting the color shift amount.

### 17.2.5 Gamma correction control

- The gamma correction value is adjusted to correct changes in gamma characteristics to a linear one. The changes in gamma characteristics are caused with variations in the photo conductor sensitivity, developing characteristics, durability, environment, and parts variations in manufacturing.
- It produces gradation patterns on the transfer belt and calculates gradation characteristics output by the current engine with the IDC sensor.
- An optimum gamma correction value is determined for each color by calculating gamma correction data from the detected data of each of the colors of $\mathrm{C}, \mathrm{M}, \mathrm{Y}$, and K .

### 17.3 Control contents (bizhub C368/C308/C258)

### 17.3.1 Image stabilization type (mode)

- Six different modes of image stabilization are available.
- A specific mode is selected according to the environmental conditions and print requirements, thereby achieving stabilized image at all times.

| Stabilization type |  |
| :--- | :--- |
| Mode 1 (initialization and image <br> stabilization) | Executed when "Initialize + Image Stabilization" is selected from the control panel. |
| Mode 1 (long image stabilization) | Executed mainly when there is a change in environmental condition. |
| Mode 2 (short image <br> stabilization) | Executed mainly after the main power switch is turned ON. |
| Mode 3 (gamma correction + <br> color registration control) | Executed when the count of the number of printed pages during a print cycle reaches 400 and there is a <br> change in machine interior temperature. |
| Mode 4 (color registration <br> control) | Executed when there is a change in machine interior temperature. |
| Mode 5 (monochrome, long <br> image stabilization) | Dedicated to monochrome and executed when there is a change in environmental condition. |
| Mode 6 (monochrome, short <br> image stabilization) | Dedicated to monochrome and executed when the number of printed pages during a print cycle reaches <br> 1000 or there is a change in machine interior temperature |

### 17.3.2 Control sequence by mode

- A different control sequence applies according to the mode of image stabilization.
- Control is performed in the specified sequence for each mode.

| Sequence | Mode 1 | Mode 2 | Mode 3 | Mode 4 | Mode 5 *4 | Mode 6 *4 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | IDC sensor adjustment | IDC sensor detection *1 | IDC sensor detection *1 | IDC sensor detection *1 | IDC sensor adjustment | IDC sensor detection |
| 2 | Dmax density adjustment | Dmax density adjustment | Color registration adjustment *2 | Color registration adjustment *2 | Dmax density adjustment | Dmax density adjustment |
| 3 | LD light intensity adjustment | Color registration adjustment *2 | Gamma correction *3 | - | LD light intensity adjustment | - |
| 4 | Color registration adjustment | Gamma correction *3 | - | - | Gamma correction *3 | - |
| 5 | Dmax density adjustment | - | - | - | - | - |
| 6 | LD light intensity adjustment | - | - | - | - | - |
| 7 | Gamma correction | - | - | - | - | - |

- *1: The IDC sensor uses the output value calculated in the last IDC registration sensor adjustment and check that the value measured on the surface of the transfer belt (background level) is within the specified range. If the measured value is out of the specified range, mode 1 is used when the next image stabilization is carried out.
- *2: Unlike the color registration adjustment of mode 1, simplified color registration control is performed.
- *3: Unlike the gamma correction of mode 1, simplified gamma correction control is performed.
- *4: Monochrome-only mode

### 17.4 Control contents (bizhub C658/C558/C458)

### 17.4.1 Image stabilization type (mode)

- Seven different modes of image stabilization are available.
- A specific mode is selected according to the environmental conditions and print requirements, thereby achieving stabilized image at all times.

| Stabilization type |  |
| :--- | :--- |
| Mode 1 (initialization and image <br> stabilization) | Executed when "Initialize + Image Stabilization" is selected from the control panel. |
| Mode 1 (long image stabilization) | Executed mainly when there is a change in environmental condition. |
| Mode 2 (short image <br> stabilization) | Executed mainly after the main power switch is turned ON. |
| Mode 3 (gamma correction + <br> color registration control) | Executed when the count of the number of printed pages during a print cycle reaches 400 and there is a <br> change in machine interior temperature. |
| Mode 4 (color registration <br> control) | Executed when there is a change in machine interior temperature. |
| Mode 5 (monochrome, long <br> image stabilization) | Dedicated to monochrome and executed when there is a change in environmental condition. |
| Mode 6 (monochrome, short <br> image stabilization) | Dedicated to monochrome and executed when the number of printed pages during a print cycle reaches <br> 1000 or there is a change in machine interior temperature. |
| Mode 7 (monochrome, gamma <br> image stabilization) | Dedicated to monochrome and executed during or after a print cycle. |

### 17.4.2 Control sequence by mode

- A different control sequence applies according to the mode of image stabilization.
- Control is performed in the specified sequence for each mode.

| Sequence | Mode 1 | Mode 2 | Mode 3 | Mode 4 | Mode 5 * 3 | Mode 6 *3 | Mode 7 *3 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | IDC sensor adjustment | IDC sensor detection *1 | IDC sensor detection *1 | IDC sensor detection *1 | IDC sensor adjustment | IDC sensor detection | IDC sensor detection |
| 2 | Dmax density adjustment | Dmax density adjustment | Color registration adjustment *2 | Color registration adjustment *2 | Dmax density adjustment | Dmax density adjustment | Gamma correction |
| 3 | LD light intensity adjustment | Color registration adjustment *2 | Gamma correction | - | LD light intensity adjustment | LD light intensity adjustment | - |
| 4 | Color registration adjustment | LD light intensity adjustment | - | - | Dmax density adjustment | Gamma correction | - |
| 5 | Dmax density adjustment | Gamma correction | - | - | LD light intensity adjustment | - | - |
| 6 | LD light intensity adjustment | - | - | - | Gamma correction | - | - |
| 7 | Gamma correction | - | - | - | - | - | - |

- *1: The IDC sensor uses the output value calculated in the last IDC registration sensor adjustment and checks that the value measured on the surface of the transfer belt (background level) is within the specified range. If the measured value is out of the specified range, mode 1 is used when the next image stabilization is carried out.
- *2: Unlike the color registration adjustment of mode 1, simplified color registration control is performed.
- *3: Monochrome-only mode

### 17.5 Operation timing

### 17.5.1 Predrive operation

- The following describe the stabilization operations executed when, for example, the main power switch is turned ON, the sleep mode is canceled, the front door is closed, or a malfunction is reset.

| Mode | Operation condition | Image stabilization setting |
| :---: | :---: | :---: |
| Mode 1 | - A new drum unit or a new developing unit is detected. <br> - A new transfer belt is detected. <br> - The machine recovers from a toner empty condition. <br> - While a warning code is being displayed. | - Not specified |
|  | - In the last image stabilization, the value of IDC sensor detection was out of the specified range. <br> - A change in environment is detected. (a change in environment exceeding the threshold value is detected since the last image stabilization sequence) <br> - The count of the number of printed pages is 10,000 as counted from the last LD adjustment. <br> - After skew adjustment reset (service mode). | - Standard or Color priority selection |
| Mode 2 | - A Dmax adjustment request is received as a result of the last gamma correction. <br> - The count of the number of printed pages after the gamma adjustment is 400 or more. <br> - Information is provided indicating that the last stabilization control was discontinued. <br> - There is a change in temperature after the lapse of a predetermined period of time after a developing drive stop. | - Standard or Color priority selection |

| Mode | Operation condition | Image stabilization setting |
| :---: | :---: | :---: |
|  | - The stabilization is executed when the main power switch is turned ON even without the operating condition | - Only Color priority selection |
| Mode 4 | - There is a change of a predetermined value or more in temperature after the color registration adjustment (when exiting from the sleep mode). | - Only Color priority selection |
| Mode 5 | - In the last image stabilization, the value of IDC sensor detection was out of the specified range. <br> - A change in environment is detected. (a change in environment exceeding the threshold value is detected since the last image stabilization sequence) <br> - The count of the number of printed pages is 10,000 as counted from the last LD adjustment. <br> - A predetermined period of time or more elapses after a developing drive stop. | - Only Black priority selection |
| Mode 6 | - A Dmax adjustment request is received as a result of the last gamma correction. <br> - The count of the number of printed pages after the gamma adjustment is 1000 or more. <br> - Information is provided indicating that the last stabilization control was discontinued. | - Only Black priority selection |

(1) Stabilization mode setting

- Optimum image stabilization control can be selected using the administrator mode or service mode according to user's use condition.
- Three options available are the standard, color priority, and black priority modes.
- Mode of image stabilization setting is provided to maintain image quality and achieve the following purposes.

1. To reduce frequency at which the stabilization control is performed in order to reduce cost per print for users who have a low print volume and low color ratio
2. To shorten time between when the machine is turned $O N$ and when it is ready for printing
3. To maintain convenience for users having a high color frequency

| Mode | Control |  |
| :--- | :--- | :--- |
| Standard | • Color stabilization is executed if image adjustments are necessary for color print or black print during predrive. |  |
| Color priority | - Color stabilization is executed if image adjustments are necessary for color print or black print during predrive. <br>  | Stabilization is executed unconditionally when the main power switch is turned ON. Warm-up time takes about 60 <br> sec. when the main power switch is turned ON. |
| Black priority | - Black stabilization is executed if image adjustments are necessary for black print during predrive. <br> - Color stabilization is executed before color print if image adjustments are necessary for color print. |  |

### 17.5.2 During a print cycle (bizhub C368/C308/C258)

- When the stabilization execution condition is met during printing, a specific image stabilization mode according to the condition is selected and executed.

| Operating conditions |  |  |  |  |  | Stabilization (mode) | Operation timing during print |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Stabilization execution condition *1 | Dmax adjustment request based on last gamma correction result | Print count after gamma correction | Change of a predetermined value or more in temperature after last stabilization *2 | The number of pages yet to be printed of the current print job | Print count after last stabilization *3 |  |  |
| Any of the conditions is met | - | - | Change | A predetermined number of pages or more | - | Mode 1 is executed | Executed by interrupting the print cycle |
|  |  |  |  | Less than a predetermined number of pages |  |  | Executed after a print cycle |
|  |  |  |  | - | $\begin{gathered} 800 \text { to } 1000 \\ \text { sheets } \end{gathered}$ |  | Executed by interrupting the print cycle |
|  |  |  |  | - | 400 sheets or more |  | Executed after a print cycle |
| None of the conditions is met | Yes |  | Change | A predetermined number of pages or more | - | Mode 2 is executed | Executed by interrupting the print cycle |
|  |  |  |  | Less than a predetermined number of pages |  |  | Executed after a print cycle |

|  |  |  |  | - | $\begin{aligned} & 800 \text { to } 1000 \\ & \text { sheets } \end{aligned}$ |  | Executed by interrupting the print cycle |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | - | 400 sheets or more |  | Executed after a print cycle |
|  | No | 400 sheets or more | Change | A predetermined number of pages or more | - | Mode 3 is executed | Executed by interrupting the print cycle |
|  |  |  |  | Less than a predetermined number of pages |  |  | Executed after a print cycle |
|  |  |  |  | - | $\begin{aligned} & 800 \text { to } 1000 \\ & \text { sheets } \end{aligned}$ |  | Executed by interrupting the print cycle |
|  |  |  |  | - | 400 sheets or more |  | Executed after a print cycle |
|  |  | 400 sheets or less | Change | A predetermined number of pages or more | - | Mode 4 is executed | Executed by interrupting the print cycle |
|  |  |  |  | Less than a predetermined number of pages |  |  | Executed after a print cycle |
|  | Yes *4 | - | - | - | - | Mode 5 is executed | Executed by interrupting the print |
|  | - | 1000 sheets or more *5 | - | - | - | Mode 6 is executed |  |

- *1: Stabilization execution condition:
- In the last image stabilization, the value of IDC sensor detection was out of the specified range.
- The last malfunction code occurs.
- A change in environment is detected. (a change in environment exceeding the threshold value is detected since the last image stabilization sequence)
- The count of the number of printed pages is 10,000 as counted from the last LD adjustment
*2: Detected by both the PH temperature sensor and temperature/humidity sensor
- *3: Counting method of printed pages

| Paper length | Count |  |  |
| :--- | :--- | :--- | :--- |
|  | Color mode | Monochrome mode |  |
| 216 mm or less | 2 | 1 |  |
| Over 216 mm | 4 | 2 |  |

- *4: Dmax adjustment request during monochrome printing
- *5: Monochrome print count value

### 17.5.3 During a print cycle (bizhub C658/C558/C458)

- When the stabilization execution condition is met during printing, a specific image stabilization mode according to the condition is selected and executed.

## (1) During a color print cycle

|  | Operating conditions |  |  |  |  |  | Stabilization (mode) | Operation timing during print |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Stabilization execution condition *1 | Print count after Dmax adjustment | Print count after gamma correction | Stabilization execution condition *2 | Change of a predetermine d value or more in temperature after last stabilization *3 | The number of pages yet to be printed of the current print job | Print count after last stabilization *4 |  |  |
| Any of the conditions is met | - | - | - | Change | A predetermined number of pages or more | - | Mode 1 is executed | Executed by interrupting the print cycle |
|  |  |  |  |  | Less than a predetermined number of pages |  |  | Executed after a print cycle |
|  |  |  |  | - | - | $\begin{aligned} & 800 \text { to } 1000 \\ & \text { sheets } \end{aligned}$ |  | Executed by interrupting the print cycle |

|  | Operating conditions |  |  |  |  |  | Stabilization (mode) | Operation timing during print |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Stabilization execution condition *1 | Print count after Dmax adjustment | Print count after gamma correction | Stabilization execution condition *2 | Change of a predetermine d value or more in temperature after last stabilization *3 | The number of pages yet to be printed of the current print job | $\begin{array}{\|c} \text { Print count } \\ \text { after last } \\ \text { stabilization *4 } \end{array}$ |  |  |
|  |  |  |  |  | - | 400 sheets or more |  | Executed after a print cycle |
| None of the conditions is met | 800 sheets or more |  | Any of the conditions is met | Change | A predetermined number of pages or more | - |  | Executed by interrupting the print cycle |
|  |  |  |  |  | Less than a predetermined number of pages |  |  | Executed after a print cycle |
|  |  |  |  | - | - | 800 to 1000 sheets |  | Executed by interrupting the print cycle |
|  |  |  |  |  | - | 400 sheets or more |  | Executed after a print cycle |
|  |  |  | None of the conditions is met | Change | A predetermined number of pages or more | - | Mode 2 is executed | Executed by interrupting the print cycle |
|  |  |  |  |  | Less than a predetermined number of pages |  |  | Executed after a print cycle |
|  |  |  |  | - | - | $\begin{aligned} & 800 \text { to } 1000 \\ & \text { sheets } \end{aligned}$ |  | Executed by interrupting the print cycle |
|  |  |  |  |  | - | 400 sheets or more |  | Executed after a print cycle |
| None of the conditions is met | 800 sheets or less | 400 sheets or more | Any of the conditions is met | Change | A predetermined number of pages or more | $\square^{-}$ | Mode 1 is executed | Executed by interrupting the print cycle |
|  |  |  |  |  | Less than a predetermined number of pages |  |  | Executed after a print cycle |
|  |  |  |  |  | - | $\begin{gathered} 800 \text { to } 1000 \\ \text { sheets } \end{gathered}$ |  | Executed by interrupting the print cycle |
|  |  |  |  |  | - | 400 sheets or more |  | Executed after a print cycle |
|  |  |  | None of the conditions is met | Change | A predetermined number of pages or more | - | Mode 3 is executed | Executed by interrupting the print cycle |
|  |  |  |  |  | Less than a predetermined number of pages |  |  | Executed after a print cycle |
|  |  |  |  | - | - | 800 to 1000 sheets |  | Executed by interrupting the print cycle |

|  | None of the conditions is <br> met | Mode 6 | Executed by interrupting <br> the print cycle |  |

- *1: Stabilization execution condition:
- A change in environment is detected. (a change in environment exceeding the threshold value is detected since the last image stabilization sequence)
- The count of the number of printed pages is 10,000 as counted from the last LD adjustment.
- *2: Stabilization execution condition:
- In the last image stabilization, the value of IDC sensor detection was out of the specified range.
- The last malfunction code occurs

### 17.5.4 Service Mode

- Types (modes) of image stabilization to be executed with the menu of the service mode will be described.
(1) Gradation Adjust ([Service Mode] -> [Imaging Process Adjustment] -> [Gradation Adjust])

| Type (mode) of image stabilization to be <br> executed | Mode 2 |
| :--- | :--- |

(2) Stabilizer ([Service Mode] -> [Imaging Process Adjustment] -> [Stabilizer])

| Type (mode) of image stabilization to be <br> executed | Initialize+Image Stabilization | Mode 1 |
| :--- | :--- | :--- |
|  | Stabilization Only | Mode 2 |

### 17.5.5 Expert Adjustment

- Types (modes) of image stabilization to be executed with the menu of the expert mode will be described.
(1) Gradation Adjustment ([Utility] -> [Administrator Settings] -> [System Settings] -> [Expert Adjustment] -> [Gradation Adjustment])

| Type (mode) of image stabilization to be <br> executed | Mode 2 |
| :--- | :--- |

(2) Image Stabilization ([Utility] -> [Administrator Settings] -> [System Settings] -> [Expert Adjustment] -> [Image Stabilization])

| Type (mode) of image stabilization to be <br> executed | Initialize+Image Stabilization | Mode 1 |
| :--- | :--- | :--- |
|  | Stabilization Only | Mode 2 |

### 17.5.6 Stabilization time (bizhub C368/C308/C258)

| Type |  |  |
| :--- | :--- | :--- |
| Mode 1 | bizhub C368 | Time |
|  | bizhub C308/C258 | Approx. 35 sec. |
| Other than the above | Approx. 20 sec. or less |  |

### 17.5.7 Stabilization time (bizhub C658/C558/C458)

| Type |  |  |
| :--- | :--- | :--- |
| Mode 1 | bizhub C658 | Approx. 23 sec. |
|  | bizhub C558 | Approx. 25 sec. |
|  | bizhub C458 | Approx. 29 sec. |
| Other than the above | bizhub C658 | Approx. 23 sec. or less |
|  | bizhub C558 | Approx. 25 sec. or less |
|  | bizhub C458 | Approx. 29 sec. or less |

## 18. IMAGE PROCESSING

### 18.1 Scanner section image processing block diagram

### 18.1.1 Processing flow

### 18.1.2 Detail

The following detail the image processing operations performed by the scanner section.

1. A reduction type CCD sensor is used to read the light reflected off the original and convert the optical data to a corresponding electric signal. To make data processing faster, data transfer and output are done through two channels, one for even-numbered pixels and the other for odd-numbered pixels.
2. The odd and even analog signals output from the CCD sensor chips are synthesized to form a single string of signal data which is in turn converted to 10-bit digital signals (1024 gradation levels).
3. The image data is transmitted to MFP board on the write section through the interface cable.

### 18.2 Write section image processing block diagram

### 18.2.1 Processing flow

### 18.2.2 Detail

The following detail the image processing operations performed by MFP board on the Write section.

1. Correct variations in reading caused by pixel-to-pixel variations in sensitivity of the CCD sensor and uneven light distribution by the exposure LED. A peak-hold-type shading correction is performed, in which the maximum value of two or more readings of two or more lines is taken to prevent effect due to dust or dirt on the shading sheet. (only image data from scanner section)
2. To correct differences in the position of each chip of CCD sensors R, G, and B, FIFO memory is adopted to match the output timing. Also correct color aberration of the lens.
3. The security pattern created during printing on this machine is detected and copying is enabled or disabled through a password. (when security kit SC-508 is mounted)
4. The scanning area is divided into multiple blocks. The ratio of color or monochrome is calculated for each of these blocks. The machine then determines whether the entire original is colored or monochrome.
5. A histogram of lightness for AE processing is generated. The AE level of the document is determined based on this histogram and AE processing is performed.
6. If outer document elimination is selected from the control panel, document area determination processing is performed for each line within the document area data acquired during prescan. Then, the START and END positions of the document area in the main scanning direction are detected and the area outside the START and END positions is erased as the outside-the-document area.
7. R, G, and B data are then converted to value and color component data for adjustments of saturation, lightness, and hue.
8. Each image area, whether it is a color edge area, black edge area, dot area, or a continuous gradation area, is discriminated.
9. Other types of processing performed are the improved reproduction of black text, edge emphasis, smoothing and color balance.
10. Each image data of $R, G$, and $B$ is compressed to reduce the consumption of data capacity.
11. Temporarily stores the BTC-compressed image data.
12. The stored image data is compressed in the JBIG (Joint bi-level image experts group) format
13. Each image data of $R, G$, and $B$ in the copy, print, scan, and fax mode is stored. In PS printing, multi-valued data of $Y, M, C$, and $K$ is stored.
14. The image data read from the file memory is uncompressed through a method in a reverse way of JBIG compression. At this time, image rotating or sorting processing is conducted.
15. JBIG image data are expanded in the frame memory.
16. Each image data of $R, G$, and $B$ is stored in frame memory.
17. Temporarily stores the image data output from the frame memory.
18. The image data is expanded through a method opposite to that used in the BTC compression.
19. FIFO memory is used to enlarge or reduce images in the main scanning direction. The image is enlarged by increasing the number of data readings and reduced by decreasing the number of data readings.
20. Reduction processing is conducted in sub scanning direction. No processing is done at same size or zoom, but at reduction, the lines are thinned out.
21. The $R, G$, and $B$ data is converted to the $Y, M, C$, and $K$ density data. Also, the masking processing, which compensates for the deviation in the spectral reflection characteristics of the toner, and UCR/BP processing are performed on the image data.
22. The security pattern is embedded in the image data. Either enabling copying through a password or unconditionally prohibiting copying can be selected from the control panel for the security pattern to be embedded. (when security kit SC-508 is mounted)
23. Edge of letter and lineal drawing gets area discrimination and FEET processing is conducted according to the discrimination result.
24. When FEET processing is conducted, interpolation is done so that no influence is given to continuous gradation portion
25. Makes the necessary corrections so that the printed gradations have linear characteristics, since the image density of the input image data is not directly proportional to that of the printed image because of the changing developing and photo conductor characteristics.
26. In photo mode during copying and PC print, the image is processed as multi-valued data (8-bit data). In any mode other than photo, the error diffusion method is employed to process the image as binary (1-bit) data
27. Creates the density distribution of a predetermined pattern to enable outstanding gradation reproduction.
28. For 1200 dpi writing, the 600 dpi image data is converted to corresponding 1200 dpi image data.
29. Image data of the file memory is developed to the frame memory and output delay control for the interval of photo conductors, $\mathrm{Y}, \mathrm{M}, \mathrm{C}, \mathrm{K}$ is conducted
30. Correct the shear in printing start position in the main scanning direction, which occurs when each PH unit of $\mathrm{Y}, \mathrm{M}, \mathrm{C}, \mathrm{K}$ is exposed on the photo conductor. Adjust the processing speed in the board (main scanning) to conform to the input processing speed.

## 19. POWER SUPPLY SECTION

### 19.1 Main power switch

bizhub C368/C308/C258

| $[1] ~ F r o n t ~ d o o r ~(o p e n ~ p o s i t i o n) ~$ | [2] $\quad$ Main power switch |
| :--- | :--- |

bizhub C658/C558/C458

| $[1] ~ L o w e r ~ f r o n t ~ d o o r ~(o p e n ~ p o s i t i o n) ~$ | $[2] \quad$ Main power switch |
| :--- | :--- | :--- |

## NOTE

- To turn OFF and ON the main power switch, first turn OFF the main power switch and wait for 10 sec. or more before turning it ON again. If a setting value or values in the service mode are changed, it takes 10 sec. or more to incorporate the setting changes properly in the machine.

### 19.2 Power key

### 19.2.1 Configuration

[1] Power key $\quad$ -

### 19.2.2 Operation

(1) Power key functions

- The power key offers two functions, serving as the power save button and the sub-power switch found in conventional models, depending on how long it is held down.
- In the default setting, holding down the power key for a short time sets the machine into the power save mode (low power mode) and holding it down for a long time sets the machine into the sub power OFF mode.
- The mode can be changed from the following: [Utility] -> [Administrator Settings] -> [System Settings] -> [Power Supply/Power Save Settings].

| How long the power key is <br> held down | Default setting | Settings changed by Administrator Settings |
| :--- | :--- | :--- |
| Short time | Low power mode *2 | Sleep mode ${ }^{* 2}$ |
|  |  | Sub power OFF mode ${ }^{* 1}$ |
| Long time | Sub power OFF mode | ErP auto power off mode ${ }^{* 1}$ |

- *1: [Utility] -> [Administrator settings] -> [System Settings] -> [Power Supply/Power Save Settings] -> [Power Key Setting]
- *2: [Utility] -> [Administrator settings] -> [System Settings] -> [Power Supply/Power Save Settings] -> [Power Save Settings]
(2) Status in each mode

| Mode |  | Condition | Power key LED |  |
| :---: | :---: | :---: | :---: | :---: |
| Standby |  | All functions are ready to accept and ready to perform jobs. | Lit up blue |  |
| Power save mode | Low power mode | - Power consumption is limited to a level lower than the standby state with the fusing temperature control minimized. <br> - Reset when a job is received or the machine is operated. | Blinking in blue |  |
|  | Sleep mode *2 <br> (Not reduce) | - Power consumption is reduced in low power mode. <br> - Sensors that are used internally are operating. | Blinking in blue |  |
|  | Sleep mode *2 <br> (Reduce) | - Power is supplied only to a portion of the MFP board required for receiving a job. <br> - When an original is placed on the scanner, a job is received, or the machine is operated, the system wakes up. |  |  |
|  | Sleep mode *2 <br> (High) | - Power is supplied only to a portion of the MFP board required for receiving a job. <br> - Reset when a job is received or the machine is operated. |  |  |

| Mode |  | Condition | Power key LED |  |
| :---: | :---: | :---: | :---: | :---: |
| Sub power OFF mode | Sleep mode *3 <br> (Not reduce) | - Power consumption is reduced in low power mode. <br> - Sensors used internally are operating. <br> - Wake-up time is shorter than when "Enabled or High" is selected. <br> - The system wakes up when the sub power is turned on. | Lit up orange |  |
|  | Sleep mode *3 <br> (Reduce) | - Power is supplied only to a portion of the MFP board required for receiving a job. <br> - A job can be received, but printing is performed when power is turned ON. <br> - Wake-up time is longer than when "Disabled" is selected. |  |  |
|  | Sleep mode *3 (High) | - Power is supplied only to the MFP board. <br> - A job can be received, but printing is performed when power is turned ON. <br> - Wake-up time is longer than when "Disabled" is selected. <br> - Power is reduced when "Enabled" is selected. |  |  |
| ErP auto po | off mode | - Power consumption to the lowest level. <br> - Reset only by the power key or the weekly timer setting. <br> - No jobs can be received. *1 <br> - The system can also wake up when this machine is equipped with optional upgrade kit UK-212 or UK-215. | Blinking in orange |  |

- *1: In ErP auto power OFF mode, this machine cannot receive data or faxes, and also it cannot scan or print an original.
- *2: The [Disabled], [Enabled], and [High] options are available from [Utility] -> [Administrator Settings] -> [System Settings] -> [Power Save Settings] -> [Power Consumption in Sleep Mode]
- *3: The [Disabled], [Enabled], and [High] options are available in sub power OFF mode from [Utility] -> [Administrator Settings] -> [System Settings] -> [Power Save Settings] -> [Power Consumption in Sleep Mode].

## (3) Power supply

Power is supplied only to the following portions in the sleep mode and the sub power OFF mode.

| 5.1V | - MFP controller <br> - FAX CPU <br> - HDD *2 <br> - USB board |
| :---: | :---: |
|  | - Angle sensor *1 <br> - Original cover sensor *1 <br> - Control panel key |

- *1: No power is supplied when the following is selected: [Utility] -> [Administrator Settings] -> [System Settings] -> [Power Consumption in Sleep Mode] -> [High].
- *2: No power is supplied when either [Enabled] or [High] is selected from: [Utility] -> [Administrator Settings] -> [System Settings] -> [Power Consumption in Sleep Mode].

- *1: Some operations selected in the service mode (Paper path check etc.)
- *2: If the machine enters the "standby" state, the fan motor turns at full speed for predetermined time before stopping
- *3: Half speed rotation after the lapse of the predetermined period of time of full speed rotation
- *4: Full speed rotation when optional CU-101 is mounted, even during warm-up.

### 20.3 Operation

### 20.3.1 Power supply cooling fan

- Draws outside air into the inside of the machine to prevent the temperature around the DC power supply, PH section, developing/drum unit.
- Air is drawn from around the edges of the first paper cassette and sent to each unit via ducts.

| $[1]$ | PH unit | $[2]$ | Power supply cooling fan (FM1) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Drum/Developing unit | - | - |

### 20.3.2 Transfer belt cleaner cooling fan

- The transfer belt cleaner cooling fan is provided to circulate air through the inside of the machine, so that the areas around the developing unit, drum unit, toner hopper, and the transfer belt unit can be cooled.
- Air around the developing unit and drum unit is drawn in.
- The air drawn in flows between the toner bottle and the transfer belt unit and is blown against the toner bottle/K.

| $[1] \quad$ Transfer belt cleaner cooling fan (FM2) | $-\quad-$ |
| :--- | :--- | :--- |

[^53]
[5]

| $[1] ~ T o n e r ~ c a r t r i d g e / K ~$ | [2] | Transfer belt unit |
| :--- | :--- | :--- |

| $[3]$ | Developing unit | $[4]$ | Drum unit |
| :--- | :--- | :--- | :--- |
| $[5]$ | Transfer belt cleaner cooling fan (FM2) | - | - |

### 20.3.3 Rear side cooling fan

- Blows outside air against around the MFP board, high voltage unit, and drive unit to prevent the temperature of the board from rising
- External air that is drawn from the bottom-rear of the main body and blown to cool the MFP board, high voltage unit, and drive units.

| $[1]$ | Rear side cooling fan (FM3) | $[2]$ |
| :--- | :--- | :--- |
| $[3]$ | Air supplied to the high voltage unit | Air to the MFP board |

### 20.3.4 Toner cartridge cooling fan

## (1) bizhub C368/C308/C258

- The machine is equipped with a toner cartridge cooling fan to equipped cooling to the toner cartridge area and the fusing section.
- The toner cartridge cooling fan sucks air from the rear side of the main body and pushes it in between the fusing unit and the toner cartridge/K.
- Creation of air flow between the fusing unit and toner cartridge may make the heat generates from the fusing unit hardly reach the toner cartridge area. This structure limits the increase in temperature of the toner cartridge area.
[1]

| $[1]$ | Toner cartridge cooling fan (FM4) | $[2]$ | Duct |
| :--- | :--- | :--- | :--- |
| $[3]$ | Fusing unit | $[4]$ | Toner cartridge/K |
| $[5]$ | Toner cartridge/C | $[6]$ | Toner cartridge/M |
| $[7]$ | Toner cartridge/Y | - | - |

## (2) bizhub C658/C558/C458

- The machine is equipped with a toner cartridge cooling fan to equipped cooling to the toner cartridge area and the fusing section.
- The toner cartridge cooling fan sucks air from the rear side of the main body and pushes it in between the fusing unit and the toner cartridge/K.
- Creation of air flow between the fusing unit and toner cartridge may make the heat generates from the fusing unit hardly reach the toner cartridge area. This structure limits the increase in temperature of the toner cartridge area.

| $[1]$ | Toner cartridge cooling fan (FM4) | $[2]$ | Toner cartridge/K |
| :--- | :--- | :--- | :--- |
| $[3]$ | Toner cartridge/C | $[4]$ | Toner cartridge/M |
| $[5]$ | Toner cartridge/Y | - | - |

### 20.3.5 IH coil cooling fan (bizhub C658/C558)

- An IH coil cooling fan is provided to cool the IH coil that heats the heating roller assy.
- Air is drawn from around the front cover of the main body and distributed inside the IH coil unit via the inlet duct.
- Hot air that has passed through the IH coil exhausts from the main body via the exhaust duct and paper cooling fan.

| $[1]$ | Fusing unit | [2] | IH coil cooling fan (FM7) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper cooling fan (FM8) | - | - |

### 20.3.6 Paper cooling fan

## (1) bizhub C368/C308/C258

- The paper cooling fan cools the paper after fusing and the paper exit/reverse section.
- The paper cooling fan sucks the warm air from the area of the paper exit/reverse section and discharges it out of the machine.
- The exhaust air is discharged externally from the main body rear side and is exhausted downward from the exhaust cover.

| $[1]$ | Exhaust cover | $[2]$ | Discharging exhaust air out of the machine |
| :--- | :--- | :--- | :--- |
| $[3]$ | Filter cover | $[4]$ | Paper cooling fan (FM8) |
| $[5]$ | Sucking warm air from the paper exit/reverse section | $[6]$ | Paper exit/reverse section |
| $[7]$ | Upper rear cover | $[8]$ | Deflection of air flow direction |

- The paper cooling fan sucks ultrafine particles (UFPs) and odors that are generated from the fusing unit, and the filter in the rear side of the main body removes them.
NOTE
- The UFP filter is fitted as standard equipment on models that are destined for Europe only.
- The deodorant filter is fitted as standard equipment on models that are destined for China only.
- The UFP and deodorant filters can be used together. When these filters are used together, the deodorant filter is mounted to the rear of the UFP filter.

| $[1]$ | Exhaust cover | $[2]$ | Filter cover |
| :--- | :--- | :--- | :--- |
| $[3]$ | Deodorant filter | $[4]$ | UFP filter |
| $[5]$ | Upper rear cover | $[6]$ | Paper cooling fan (FM8) |
| $[7]$ | Paper exit/reverse section | $[8]$ | Fusing unit |

(a) UFP removal function

- The UFP filter removes UFPs in the air.

NOTE

- The UFP filter does not requires a periodic replacement.
- A higher air cleaning performance can be achieved through installing optional clean unit CU-101.
(b) Deodorization function
- The deodorant filter removes odors in the air.

NOTE

- The deodorant filter does not requires a periodical replacement.

## (2) bizhub C658/C558/C458

- The paper cooling fan cools the paper after fusing and the paper exit/reverse section.
- The paper cooling fan sucks the warm air from the area of the paper exit/reverse section and discharges it out of the machine.
- The exhaust air is discharged externally from the main body rear side and is exhausted downward from the exhaust cover.

| $[1]$ | Exhaust cover | $[2]$ | Paper cooling fan (FM8) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper exit/reverse section | $[4]$ | Filter cover |

- The paper cooling fan sucks ultrafine particles (UFPs) and odors that are generated from the fusing unit, and the filter in the rear side of the main body removes them.

## NOTE

- The UFP filter is fitted as standard equipment on models that are destined for Europe only.
- The deodorant filter is fitted as standard equipment on models that are destined for China only.
- The UFP and deodorant filters can be used together. When these filters are used together, the deodorant filter is mounted to the rear of the UFP filter.

| $[1]$ | Exhaust cover | $[2]$ | Filter cover |
| :--- | :--- | :--- | :--- |
| $[3]$ | Deodorant filter | $[4]$ | UFP filter |
| $[5]$ | Deodorant filter | $[6]$ | Upper rear cover |
| $[7]$ | Paper cooling fan (FM8) | $[8]$ | Paper exit/reverse section |
| $[9]$ | Fusing unit | - | - |

(a) UFP removal function

- The UFP filter removes UFPs in the air.

## NOTE

- The UFP filter does not requires a periodic replacement.
- A higher air cleaning performance can be achieved through installing optional clean unit CU-102.
(b) Deodorization function
- The deodorant filter removes odors in the air.

## NOTE

- The deodorant filter does not requires a periodical replacement.

### 20.3.7 Toner suction fan

- The toner suction fan draws the toner dust from the ends of the developer unit to prevent contamination of the machine.
- Air that is drawn in via the toner filter is blown into the machine via ducts to cool the drum unit and developing unit.
- Air is drawn and circulated throughout the machine for many different purposes.

| $[1]$ | Toner filter | [2] |
| :--- | :--- | :--- |

[1] Toner suction fan (FM11)

### 20.3.8 Fusing power supply cooling fan

- The fusing power supply cooling fan is used to cool the fusing power supply and IH power supply.
- The fusing power supply cooling fan in the power supply box draws air from the sides of the main body. It blows this air to cool the power supply boards.

### 20.3.9 UFP exhaust fan1, UFP exhaust fan2

- Air from the paper cooling fan and IH coil cooling fan is drawn with the UFP exhaust fan and exhausted outside of the machine. Heat around the fusing section and air around the reverse section are also drawn.
- bizhub C658 is equipped with two UFP exhaust fans.
- Air that is drawn with the UFP exhaust fan is discharged from the machine via the filter.

| $[1]$ | UFP exhaust fan1 (FM17) | $[2]$ | Fusing unit |
| :--- | :--- | :--- | :--- |
| $[3]$ | UFP exhaust fan2 (FM18) | - | - |

## 21. COUNTER CONTROL

### 21.1 Configuration

| $[1]$ | MFP board (mechanical control area) (MFPB) | $[2]$ | MFP board (controller area) (MFPB) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Electronic counter | $[4]$ | Key counter (option) |

### 21.2 Operation

| Name | Function/system |
| :---: | :---: |
| Electronic counter | - Number of total in copy/print/fax/scan mode will be displayed on the screen as described below. <br> - Black, full color, mono color, and 2 color <br> - Total counter, large size counter, color total (copy + printer), scan counter, fax TX counter, fax RX counter, No. of originals counter, No. of prints counter, total duplex counter <br> - Counts one when an exit signal is applied to it |
| Key counter (option) | - When charging prints by using the key counter, copies cannot be made without the key counter. However PC prints and fax TX/RX service are available without the key counter. <br> - Displays the cumulative number of copies while the key counter is being mounted. <br> - A mechanical counter driven by an electric signal <br> - Counts one when a paper feed start signal or image forming start signal, whichever occurs earlier, is applied to it |

## NOTE

- The counting modes can be selected at [Billing Setting] of Service Mode. For details, see " I.8.3.1 Counter Setting".

## 22. HEATER

### 22.1 Configuration (HT-509/MK-735)

- Optional heater HT-509 can be attached to the bottom (top of the paper feed cabinet) of the paper tray 2 on the machine.

Rear view

| $[1]$ | Dehumidifier heater (DH111): HT-509 | $[2]$ | Paper feed cabinet (Example: PC-210) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Dehumidifier heater switch | $[4]$ | Power Supply BOX MK-734 |

### 22.2 Configuration (LU/TK-101)

- To make use of the function of the dehumidifier heater, the following combined optional equipment is required.
- Transformer kit TK-101
- Power Supply BOX MK-734
- Paper feed cabinet PC-110, PC-115, PC-210, PC-215, PC-410 or PC-415.

| $[1]$ | Power Supply BOX MK-734 | $[2]$ | Dehumidifier heater (DH): Standard equipment |

| $[3]$ | Paper feed cabinet PC-110/PC-115/PC-210/PC-215/ <br> PC-410/PC-415 or desk DK-510 | $[4]$ | Transformer kit TK-101 |

### 22.3 Control

### 22.3.1 HT-509/MK-735

- The heater provides heat when it is energized to prevent paper in the paper feed cabinet and paper feed trays from absorbing damp. It prevents paper curling, paper misfeeds, paper jams, and abnormal images that occur when paper absorbs the damp.
- Turn on the dehumidifier heater switch of Power Supply BOX MK-734 to perform humidity control.
- Turn off the dehumidifier heater switch to stop the dehumidifier heater function.

[2]

| $[1] ~ D e h u m i d i f i e r ~ h e a t e r ~ s w i t c h ~$ | [2] |
| :--- | :--- |

## (1) Operation timing

- If the machine is stopped*, the heater is energized and generates heat.
- When the machine starts normally, it stops energizing the heater.

## NOTE

- *: When the covers are opened, a problem or paper jam occurs, or in power-saving mode.

### 22.3.2 LU/TK-101

- The heater provides heat when it is energized to prevent paper in the large capacity unit tray from absorbing damp. It prevents paper curling, paper misfeeds, paper jams, and abnormal images that occur when paper absorbs the damp.
- Turn on the dehumidifier heater switch on power supply box MK-734 to perform humidity control.
- Turn off the dehumidifier heater switch to stop humidity control.

[2]

| $[1]$ | Dehumidifier heater switch | [2] Power Supply BOX MK-734 |
| :--- | :--- | :--- |

## (1) Operation timing

- If the machine is stopped*, the heater is energized and generates heat.
- When the machine starts normally, it stops energizing the heater.

## NOTE

- *: When the covers are opened, a problem or paper jam occurs, or in power-saving mode.

## 23. INDICATOR FUNCTION

### 23.1 Configuration

23.1.1 Control panel section

| $[1]$ | Start key indicator section | $[2]$ | Power key indicator section |
| :--- | :--- | :--- | :--- |
| $[3]$ | Warning status indicator section | - | - |

### 23.1.2 Front side section

The following illustration is for bizhub C368/C308/C258.

| $[1]$ | Operation status indicator section | $[2]$ | Data indicator section |
| :--- | :--- | :--- | :--- |
| $[3]$ | Remaining paper level display section | - | - |

### 23.2 Control

- The lighting control for the LED on each indicator section is described below.

### 23.2.1 Power key and Start key indicator section

| Condition | LED indicator |  |
| :--- | :--- | :--- |
| During warm-up | Lit up blue | Lit up orange |

| Condition | LED indicator |  |
| :---: | :---: | :---: |
|  |  |  |
| During stand-by | Lit up blue | Lit up blue |
|  |  |  |
| During copying or printing | Lit up blue | Lit up blue or orange |
|  |  |  |
| Paper misfeed or trouble | Lit up blue | Lit up orange |
|  |  |  |
| Low power mode Sleep mode | Blinking in blue | Unlit |
|  |  |  |
| ErP auto power off mode | Blinking in orange | Unlit |
|  |  |  |
| Sub power off mode | Lit up orange | Unlit |
|  |  |  |

### 23.2.2 Warning status indicator section

| Condition |  | LED indicator |
| :--- | :--- | :--- |
| When machine stops |  | Lit up orange |
|  |  |  |

| Condition | LED indicator |
| :---: | :---: |
|  |  |
| When warning occurs | Blinking in orange |
|  |  |
| Other status | Unlit |
|  |  |

### 23.2.3 Operation status indicator section

| Condition |  |
| :--- | :--- |
| LED indicator |  |
|  |  |

### 23.2.4 Data indicator section

| Condition | LED indicator |
| :---: | :---: |
| Storing a job | Lit up blue |
|  |  |
| Receiving a job | Blinking in blue |
|  |  |

| Condition |  |
| :--- | :---: |
| Other status |  |
|  |  |
|  |  |
|  |  |

23.2.5 Remaining paper level display section

| Condition |  |  |
| :--- | :--- | :--- |
| Paper empty |  | LED indicator |
| Paper near empty |  |  |

- *: The lighting status varies depending on the following settings. [Service Mode] -> [System 1] -> [Machine State LED Setting]. Type 1: Blinks in orange, Type 2: Unlit

## 24. CHANGES IN REFRESH MODEL

### 24.1 What is the Refresh Model?

- Although the product name is remained same as the previous product name, each section has been improved.
- It can be identified with the serial number (Serial No.) on the manufacturer plate on the main body.

| Product name | Item code | Serial number (Serial No.) |
| :---: | :---: | :---: |
| bizhub C368 | A7PUxx7 | A7PUxx7000001 or later |
| bizhub C308 | A7PYxx7 | A7PYxx7000001 or later |
| bizhub C258 | A7R0xx7 | A7R0xx7000001 or later |

### 24.2 Scanner Section

- The following changes are made in the refresh model.

1. The CCD module on the CCD board is changed.

### 24.2.1 CCD Board

The manufacturer is changed due to disuse of the CCD module. Therefore, the CCD board is changed.

| $[1]$ | CCD module | $[2]$ | CCD board |
| :--- | :--- | :--- | :--- |
| $[3]$ | CCD mounting plate | - | - |

## NOTE

- To install the new CCD board to the previous MFP, the functional version of firmware on the MFP must be updated to 4.0 or later.
- The CCD board can be identified automatically due to the firmware update.

### 24.3 Paper Feed Section

| Change point | Description | Applicable tray |
| :---: | :---: | :---: |
| Enabled printing on custom-size paper | - Enabled printing on custom-size paper from the tray 1 and the tray 2. <br> - Added settings for detecting custom-size paper. (Engine FW DIP SW No.19: "ON" by default) | - Tray 1 <br> - Tray 2 |
| Changed mechanism of paper length guide and paper width guide | - Supported with the universal design <br> - When paper is loaded, the ease of operation for adjusting the paper length guide and the paper width guide is improved. <br> - Improvement is made to prevent a mis-setting on the paper size, and also prevent paper from bending during paper feed. | - Tray 1 <br> - Tray 2 <br> - Tray 3 (Option) <br> - Tray 4 (Option) |

### 24.3.1 Supporting Custom-size Paper

- From the tray 1 and tray 2, printing on custom-size paper is enabled.

| Tray | Previous model | Refresh model |  |
| :--- | :--- | :--- | :--- |
|  | Custom size | Custom size | Range |
| Tray 1 | Not settable | Settable | Length $(X): 182 \mathrm{~mm}$ to 431.8 mm <br> Width $(Y): 139.7 \mathrm{~mm}$ to 297 mm |
| Tray 2 | Not settable | Settable | Length $(X): 182 \mathrm{~mm}$ to 457.2 mm <br> Width $(Y): 139.7 \mathrm{~mm}$ to 320 mm |

- Screen for changing settings of tray 1

### 24.3.2 Paper Length Guide

- Two methods are provided to operate the paper length guide.
- Squeeze the paper length guide to operate it in the direction orthogonal to the direction of movement.
- Squeeze the paper length guide to operate it in the same direction as the direction of movement.
- Paper length guide positioning employs grooves corresponding to each standard size and a free-stop method of movement using latches between each pair of grooves.

| $[1]$ | Squeezing in the same direction as the direction of <br> movement | [2]Squeeze in the direction orthogonal to the direction of <br> movement |
| :--- | :--- | :--- |
| $[3]$ | Direction of movement of the paper length guide | $[4]$ | Paper length guide | Pa |
| :--- |

### 24.3.3 Paper Width Guide

- A latching positioning method is used to prevent the paper width guide from misalignment due to shock that is generated during inserting trays.

| $[1]$ | Paper width guide |
| :--- | :--- |

## PA THEORY OF OPERATION DUAL SCAN DOCUMENT FEEDER/SP-501/ UK-501 (bizhub C658/C558/C458)

1. CONFIGURATION

### 1.1 Section configuration

| $[1]$ | Registration section | $[2]$ | Paper feed section |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper exit section | $[4]$ | Read section |

## 2. PAPER PATH

### 2.1 Paper path

| $[1]$ | Pick-up roller | $[2]$ | Feed roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Registration roller | $[4]$ | Reading roller 1 |
| $[5]$ | Reading roller 2 | $[6]$ | CIS module (CIS) |
| $[7]$ | Reading roller 3 | $[8]$ | Exit roller |

## 3. PAPER FEED SECTION

### 3.1 Configuration

| $[1]$ | Take-up motor (M1) | $[2]$ | Lift-up motor (M5) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Pick-up roller | $[4]$ | Empty sensor (PS1) |
| $[5]$ | Length sensor/1 (PS10) | $[6]$ | Length sensor/2 (PS11) |
| $[7]$ | Restriction plate positional volume (VR1) | $[8]$ | Lift up lower sensor (PS3) |
| $[9]$ | Lift up upper sensor (PS2) | $[10]$ | Separation roller |
| $[11]$ | After separate sensor (PS4) | $[12]$ | Feed roller |
| $[13]$ | Document feed sensor (PS21) | $[14]$ | Take-up clutch (CL1) |

### 3.2 Drive

| $[1]$ | Take-up motor (M1) | $[2]$ | Lift-up motor (M5) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Lift-up lever | $[4]$ | Separation roller |
| $[5]$ | Feed roller | $[6]$ | Pick-up roller |
| $[7]$ | Take-up clutch (CL1) | - | - |

### 3.3 Operation

### 3.3.1 Original set/empty detection

- When an original is loaded on the document feed tray, the empty sensor detects that the presence of the original document.
- When all pages of the original have been fed, the empty sensor detects that there are no more originals.

| $[1]$ Original | [2] Empty sensor (PS1) |
| :--- | :--- |

### 3.3.2 Original size detection mechanism

| $[1]$ | Length sensor/1 (PS10) | $[2]$ | Length sensor/2 (PS11) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Restriction plate positional volume (VR1) | $[4]$ | Original width guide plate |
| $[5]$ | Consolidation sensor/3 (PS15) | $[6]$ | Before read sensor (PS6) |
| $[7]$ | Consolidation sensor/2 (PS14) | $[8]$ | Consolidation sensor/1 (PS13) |

## (1) Size detection in standard mode

(a) Detecting the width of the original

- The original is to be loaded in the document feed tray by aligning it with reference to the center of the document feed tray in the standard mode.
- The width of the original is loaded on the document feed tray will be detected with the restriction plate positional volume.
- The restriction plate positional volume includes a variable resistor. The resistor values change in accordance with movement of the original width guide plate.

## (b) Detecting the length of the original

- The length of the original is loaded on the document feed tray will be detected by the length sensors/1 and /2.
- The length sensor/1 is a transmission type, while length sensor/2 is a reflection type. The length sensor $/ 1$ is detected by two actuators, that is, actuator 1 and actuator 2.
- When the document feed tray is not loaded with any originals, length sensor/1 is blocked. When an original is loaded and only actuator 1 is pressed, document length sensor/1 is unblocked. When both actuator 1 and actuator 2 are pressed, a blocked document length sensor/1 is detected by actuator 2 .

| $[1]$ | Length sensor/1 (PS10) | $[2]$ | Actuator 1 |
| :--- | :--- | :--- | :--- |
| $[3]$ | Length sensor/2 (PS11) | $[4]$ | Actuator 2 |

## (2) Size detection in mixed original / AMS mode

(a) Detecting the width of the original

- In the mixed original mode, the original is aligned to the rear side of the document width guide plate.
- In the mixed original / AMS mode, no width is determined on the document feed tray; rather, the width is detected while the originals are being fed.
- Three consolidation sensors are disposed at positions immediately after the paper feed section, functioning to detect the width of the original.
(b) Detecting the length of the original
- In the mixed original/AMS mode, the length of the original is not determined on the document feed tray. But the length is calculated and determined based on the period of time during which the before read sensor remains activated.

### 3.3.3 Up/down control for the document feed tray

- The document feed tray rises to feed originals.
- The lift-up motor performs the up/down control of the document feed tray.
- The document feed tray is lowered due to completion of a job, paper jam, or paper misloading.

| $[1]$ | Lift-up motor (M5) | $[2]$ | Lift-up lever |
| :--- | :--- | :--- | :--- |
| $[3]$ | Lift up lower sensor (PS3) | $[4]$ | Lower limit detection actuator |
| $[5]$ | Empty sensor (PS1) | $[6]$ | Lift up upper sensor (PS2) |
| $[7]$ | Upper limit detection actuator | $[8]$ | Pick-up roller |

## (1) Preliminary up operation

- The document feed tray stops in the lower limit position during standby.
- When a job starts with the document feed tray at the lower limit position, the tray will take longer to rise until paper is fed.
- To shorten the time from the job start to end, lift the document feed tray to the document feed tray standby position in advance.
- The document feed tray standby position can be adjusted through [Administrator Settings] -> [System Settings] -> [ADF Settings]. Preliminary lift is not performed and stands by at the lower limit position if OFF is selected.

## (2) Up operation

- The document feed tray stops in the lower limit position during standby.
- When an original is loaded into the tray, the empty sensor detects the original. The lift-up motor turns on when the control panel is pressed.
- The lift-up lever moves via lift-up motor drive to lift the document feed tray to the document feed tray standby position.
- The lift-up motor is driven to lift the document feed tray to the document feed position when the Start key is pressed.
- The top surface of the original pushes up the pick-up roller. The lift operation stops at the timing when the lift up upper sensor is unblocked.
- The number of originals decrease as each document is fed. The lift operation is performed again once the lift up upper sensor is blocked to maintain an optimal paper feed position.

## (3) Down operation

- Once all originals have been fed and the empty sensor detects the empty state, the lift-up motor operates in reverse.
- The lift-up lever moves via lift-up motor drive to lower the document feed tray.
- The operation to lower the document feed tray stops when the lift up lower sensor is blocked.
- The document feed tray is lowered in an original empty state when a job completes or originals have been pulled out.
- The document feed tray is lowered due to paper jam, paper misloading, or a state that the DF is raised.

### 3.3.4 Original take-up control

- The take-up motor provides the drive for original take-up operations.
- The drive from the take-up motor is transmitted to the pick-up roller and feed roller when the take-up clutch is energized. The original is picked up and fed in by the rotation of the rollers.
- The original picked up and fed in is transported onto the registration roller.

| $[1]$ | Take-up motor (M1) | $[2]$ | Pick-up roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Separation roller | $[4]$ | After separate sensor (PS4) |
| $[5]$ | Registration roller | $[6]$ | Registration sensor (PS5) |
| $[7]$ | Feed roller | $[8]$ | Document feed sensor (PS21) |
| $[9]$ | Take-up clutch (CL1) | - | - |

### 3.3.5 Double feed detection (UK-501)

- With the optional UK-501 being installed, it is possible to detect originals double feed.
- At double feed detection, the passing originals come in contact with ultrasonic waves. Depending on the amount of unblocked ultrasonic waves, it can be determined whether originals are double feed.
- Double feed detection uses a detection board that is configured with one pair of a receiver and a transmitter.

| $[1]$ | Multi feed detection board/2 (receiver) (MFDB/2) | $[2]$ | Feed roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Multi feed detection board/1 (transmitter) $($ MFDB/1) | $[4]$ | Registration roller |

## (1) Double feed detection control

- Originals come into contact with ultrasonic waves that are transmitted from the multi feed detection board/1 (transmitter). The ultrasonic waves are received on the multi feed detection board/2 (receiver).
- The ultrasonic waves attenuate due to the air layer between originals when originals are double feed.
- The voltage at the receiver is checked. A determination of original double feed is made if the voltage is the same as or less than a predetermined value.
- The following lists the type of originals that can be detected for double feed.
- Originals with weight of 35 to $210 \mathrm{~g} / \mathrm{m}^{2}(95 / 16$ to $557 / 8 \mathrm{lb})$. Other types of originals may not be detected properly when double feed occurs.

| $[1]$ | Multi feed detection board/2 (receiver) (MFDB/2) | $[2]$ | Feed roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Scanned original | $[4]$ | Double feed original |
| $[5]$ | Multi feed detection board/1 (transmitter) (MFDB/1) | $[6]$ | Ultrasonic waves |

## (2) Operation after double feed detection

- The following two operations are available when double feeds are detected.

The desired operation can be selected from [Switch No. 121] in [Service Mode] -> [System 2] -> [Software Switch Setting].

- Stop transporting the double feed originals at the time that the double feed is detected. The software switch settings value is "Bit assignment 00000000 / HEX assignment 00".
- Discharge the fed originals after a double feed is detected and then stop feeding paper. The software switch settings value is "Bit assignment 00000010 / HEX assignment 02".

## (3) Double feed detection adjustment

- Sensitivity adjustment of the multi feed detection sensor is performed at the time of installing or replacing the double feed detection kit.
- Sensitivity adjustment of the multi feed detection sensor is performed from [Service Mode] -> [ADF] -> [Multi Feed DetectionAdj.].
- Tuck in the double feed detection kit (UK-501) adjustment sheet between the multi feed detection board/1 (transmitter) and the multi feed detection board/2 (receiver), and output ultrasonic waves.
- Adjust the value that is received at the multi feed detection board/2 (receiver) within the specified range.

## 4. REGISTRATION SECTION

### 4.1 Configuration

| $[1]$ | Registration sensor (PS5) | $[2]$ | Consolidation sensor/1 (PS13) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Consolidation sensor/2 (PS14) | $[4]$ | Consolidation sensor/3 (PS15) |
| $[5]$ | Registration roller | $[6]$ | Registration motor (M2) |
| $[7]$ | Read open/close sensor (PS16) | - | - |

### 4.2 Drive

| $[1]$ | Registration motor (M2) | Registration roller |
| :--- | :--- | :--- |

### 4.3 Operation

### 4.3.1 Registration control

- The registration roller is driven by the registration motor.
- While the original is being transported, a loop is formed in the original between the tack-up roller and registration roller to thereby correct any skew in the original.
- The registration sensor detects original and the timing at which to de-energize the registration motor is controlled.

| $[1]$ | Registration sensor (PS5) | $[2]$ | Loop formation |
| :--- | :--- | :--- | :--- |
| $[3]$ | Feed roller | $[4]$ | Original |
| $[5]$ | Registration roller | - | - |

## 5. READ SECTION

### 5.1 Configuration

| $[1]$ | Reading motor (M3) | $[2]$ | DF original glass cleaning brush |
| :--- | :--- | :--- | :--- |
| $[3]$ | Back side cleaning motor (M7) | $[4]$ | Back side cleaning home sensor (PS9) |
| $[5]$ | Reading roller 3 | $[6]$ | Reading roller 2 |
| $[7]$ | CIS module (CIS) | $[8]$ | CIS glass cleaning brush |
| $[9]$ | CIS under guide open/close sensor (PS20) | $[10]$ | Front side cleaning home sensor (PS18) |
| $[11]$ | Front side cleaning motor (M8) | $[12]$ | Before read sensor (PS6) |
| $[13]$ | Reading roller 1 | $[14]$ | DF temperature sensor (TH) |
| $[15]$ | Read roller home sensor (PS8) | $[16]$ | Reading roller pressure/retraction motor (M6) |

### 5.2 Drive

| $[1]$ | Reading motor (M3) | $[2]$ | Back side cleaning motor (M7) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Reading roller 3 | $[4]$ | CIS glass cleaning brush |
| $[5]$ | Reading roller 2 | $[6]$ | Front side cleaning motor (M8) |
| $[7]$ | DF original glass cleaning brush | $[8]$ | Reading roller 1 |
| $[9]$ | Reading roll | $[10]$ | Reading roller pressure/retraction motor (M6) |

### 5.3 Operation

### 5.3.1 Reading transport control

- The reading roller 1,2 , and 3 are driven by the reading motor.
- When reading a 2 -sided original, the 2-sided original (the front side and back side) is read at once in one pass of the original.
- The front side of the 2-sided original is read by the scanner unit section of the main body after the leading edge of the original has moved past reading roller 1 . The back side of the 2 -sided original is read by the CIS after the leading edge of the original has moved past reading roller 2.

| $[1]$ | Reading motor (M3) | $[2]$ | Reading roller 3 |
| :--- | :--- | :--- | :--- |
| $[3]$ | CIS module (CIS) | $[4]$ | Reading roller 2 |
| $[5]$ | Reading roller 1 | - | - |

### 5.3.2 Reading roller pressure/retraction control

- Original speed fluctuates as the trailing edge of the original moves past reading roller 1. To inhibit these speed fluctuations, the reading roller pressure/retraction motor is employed to retract reading roller 1.
- The rotation of the cam is driven by the reading roller pressure/retraction motor via the gear.
- Due to the rotation of the cam, the lever is put back and the reading roll being pressed against the reading roller 1 is pushed down.

| $[1]$ | Reading roller pressure/retraction motor (M6) | $[2]$ | Read roller home sensor (PS8) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Reading roller 1 | $[4]$ | Reading roll |
| $[5]$ | Lever | $[6]$ | Cam |

### 5.3.3 DF original glass contamination prevention control

(1) DF original glass cleaning

- A reading line can occur if the DF original glass is contaminated with dust or dirt. The DF original glass cleaning mechanism prevents this fault from occurring.
- The cleaning brush rotates to remove dust sticking to the DF original glass.
- The cleaning brush is rotated by the front side cleaning motor.
- The front side cleaning home sensor detects the cleaning brush at its home position.

| $[1]$ | Reading roller 2 | $[2]$ | Cleaning brush |
| :--- | :--- | :--- | :--- |
| $[3]$ | DF original glass | $[4]$ | Reading roller 1 |
| $[5]$ | Front side cleaning home sensor (PS18) | $[6]$ | Front side cleaning motor (M8) |

## (2) Details of DF original glass cleaning

| Condition |  |  |
| :--- | :--- | :--- |
| Predrive | Power ON | Rotates the cleaning brush one complete turn to check for its correct operation. |
|  | Existing from sleep | Before starting reading |
|  | During reading (not <br> performed in black mode) | Rotates the cleaning brush one complete turn to perform cleaning. <br> Rotates the cleaning brush one complete turn to perform cleaning for every two originals <br> during continuous reading of originals. |
|  | Rotates the cleaning brush three complete turns to perform cleaning for each original <br> during continuous reading of originals, if the despeckle mode is selected. |  |
|  | After completing reading <br> last original | The cleaning brush tends to curl if repeatedly operated in one direction only, resulting in <br> poor cleaning performance. To straighten the brush, it is rotated one complete turn in the <br> backward direction when reading of the last original is completed. |

### 5.3.4 CIS original reading control

- The back side of the original is read by the CIS (contact image sensor) module. The image data read by the CIS is transferred to the dual scan image processing board.
- The CIS original reading section consists of the CIS module, DF power supply and the back side cleaning mechanism.
- The CIS module has two LEDs.

| $[1]$ | Back side cleaning motor (M7) | $[2]$ | Cleaning brush |
| :--- | :--- | :--- | :--- |
| $[3]$ | DF power supply (DFPU) | $[4]$ | CIS module (CIS) |

- A cleaning brush to which a white plate is affixed is disposed on the side opposite the CIS module. Use of a specific position of the cleaning brush through rotation of the cleaning brush allows the following operations to be performed: "gain adjustment/shading correction", "ADF Scan Glass Contamin. Sensitivity", and "CIS glass cleaning by the brush".
- "Document passage" is performed at the home position.
- "Shading correction", "gain adjustment", and "ADF Scan Glass Contamin. Sensitivity" are made using the shading surface.

| $[1]$ | White plate affixed | $[2]$ | CIS module (CIS) |
| :--- | :--- | :--- | :--- |
| $[3]$ | CIS glass | $[4]$ | Cleaning brush (Home position) |
| $[5]$ | Cleaning brush (Shading correction surface) | - | - |

### 5.3.5 CIS control when power is turned ON

1. The LEDs of CIS module are turned ON.
2. The cleaning brush is detected at its home position.
3. The cleaning brush is rotated and brought to a stop at the gain adjustment position. The gain adjustment is made twice with the cleaning brush at that position.
The gain adjustment is performed near the center of the shading correction surface.
4. After the adjustments, the LEDs are turned OFF.
5. The cleaning brush is rotated and brought to a stop at the home position.

* The same control is performed when the main body exits from the sleep mode.

| $[1]$ | CIS module (CIS) | $[2]$ | Cleaning brush (Home position) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Cleaning brush (Gain adjustment position) | - | - |

### 5.3.6 CIS control when the document is loaded

1. The cleaning brush is detected at its home position.
2. The LEDs of CIS module are turned ON.
3. The cleaning brush is rotated four complete turns.

The cleaning brush cleans the CIS glass during its first turn.
The cleaning brush uses the shading correction surface to perform the shading correction during its second and third turn. The shading correction is performed (a total of twice).
The cleaning brush uses the shading correction surface to perform "ADF Scan Glass Contamin. Sensitivity" during its fourth turn.
4. The LEDs are turned OFF.
5. The cleaning brush is rotated and brought to a stop at the home position.

## NOTE

- No operation is performed when the document is loaded if the following function is selected using the service mode: [System 2] $>$ [ADF Scan Glass Contamin. Set.] -> [Back Side] -> [ADF Scan Glass Contamin. Sensitivity] -> [Not Set].

### 5.3.7 CIS control when the start key is pressed

- This control is performed only in the 2-sided original reading mode.
(1) Before a print cycle (back side reading)

1. The cleaning brush is detected at its home position.
2. The LEDs of CIS module are turned ON.
3. The cleaning brush is rotated three complete turns.

The cleaning brush cleans the CIS glass during its first turn.
The cleaning brush uses the shading correction surface to perform the shading correction during its second and third turn.
4. With the LEDs ON, the cleaning brush is brought to a stop at its home position (waiting for the original).
5. The back side of the original is read as the original moves over the CIS.
(2) During a print cycle (operation between originals after reading)

The brush cleaning operation is normally performed each time the original is read.
If a print cycle produces a large number of printed pages continuously, however, either the cleaning operation or the shading correction operation is performed.
The shading correction operation is performed at predetermined intervals during a multiprint cycle in order to maintain an appropriate shading correction value.
(a) Cleaning operation

1. The cleaning brush is rotated one complete turn.
(The cleaning brush normally makes one turn, but makes three turns in the despeckle mode.)
2. With the LEDs ON, the cleaning brush is brought to a stop at its home position (waiting for the original).
(b) Shading correction operation
3. The cleaning brush is rotated three complete turns.

The cleaning brush cleans the CIS glass during its first turn.
The cleaning brush uses the shading correction surface to perform the shading correction during its second and third turn. The shading correction is performed (a total of twice).
2. With the LEDs ON, the cleaning brush is brought to a stop at its home position (waiting for the original).

| $[1]$ | CIS module (CIS) | $[2]$ | Cleaning brush (Home position) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Cleaning brush (Shading correction surface) | - | - |

## (c) After the print cycle

1. After the reading sequence, the LEDs are turned OFF.
2. The cleaning brush is turned backward (to tame the brush).
3. The cleaning brush is brought to a stop when its home position is detected.
4. The cleaning brush perform "ADF Scan Glass Contamin. Sensitivity".

- The LEDs are turned ON. The cleaning brush is rotated four complete turns.
- The cleaning brush cleans the CIS glass during its first turn.
- The cleaning brush uses the shading correction surface to perform the shading correction during its second and third turn. The shading correction is performed (a total of twice).
- The cleaning brush uses the shading correction surface to perform "ADF Scan Glass Contamin. Sensitivity" during its fourth turn.
- The cleaning brush is brought to a stop at its home position.
- The LEDs are turned OFF.

## NOTE

- Steps of 4 is not performed if the following function is selected using the service mode: [System 2] -> [ADF Scan Glass Contamin. Set.] -> [Back Side] -> [ADF Scan Glass Contamin. Sensitivity] -> [Not Set] .

### 5.3.8 CIS glass contamination prevention control

## (1) CIS glass cleaning

- The CIS glass is cleaned only when two sides of the original are to be read.
- When the back side cleaning motor is energized, the cleaning brush is rotated to remove dust and dirt from the surface of the CIS glass.
- Cleaning of the DF original glass (front side) takes place at timing different from that of cleaning of the CIS glass (back side) and the cleaning of the back side sources its power drive differently from the front side.
- The cleaning brush at its home position is detected by the back side cleaning home sensor.

| $[1]$ | Back side cleaning motor (M7) | $[2]$ | Back side cleaning home sensor (PS9) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Cleaning brush | $[4]$ | CIS module (CIS) |

### 5.3.9 Opening and closing guide set detection

- The opening and closing guide is provided to facilitate misfeed clearing procedures performed near the back side reading position.
- The CIS under guide open/close sensor detects the opening and closing guide in the closed position.
[3]
[2]
[1]

[4]

| $[1]$ | Opening and closing guide | $[2]$ | CIS under guide open/close sensor (PS20) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Lever | $[4]$ | Original pad |

## 6. PAPER EXIT SECTION

### 6.1 Configuration

| $[1]$ | Exit motor (M4) | $[2]$ | Exit roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Exit sensor (PS7) | - | - |

### 6.2 Drive

| $[1]$ | Exit motor (M4) |
| :--- | :--- |

### 6.3 Operation

### 6.3.1 Document exit mechanism

- The paper exit section includes the exit roller that feeds the original transported from the read section out onto the exit tray.
- The exit roller is driven by the exit motor.

| $[1]$ | Exit motor (M4) | $[2]$ | Exit sensor (PS7) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Original | $[4]$ | Exit roller |

### 6.3.2 Faxed original stamp function SP-501

- Mounting the optional "Stamp unit SP-501" allows a stamp to be placed on a faxed original.
- The stamp solenoid located upstream of the original exit roller is energized when the original is about to be fed out and the stamp mounted on the solenoid plunger is pressed against the surface of the original. This places a faxed mark (+) on the surface of the original
- This function is enabled when [Service Mode] -> [System 2] -> [Stamp] -> [Set] (default setting: Unset) is configured and the user selects [Application] -> [Stamp/Composition] -> [TX Stamp] (default setting: OFF)" on the "Scan/Fax" screen.
- This function is not used for "Copy" or "Scan".

| $[1]$ | Original | $[2]$ | Exit roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Stamp unit (SP-501) | $[4]$ | Reading roller 3 |

## 7. OPEN AND CLOSE DETECTION SECTION

### 7.1 DF angle open and close detection

- The lever actuator is provided to detect the original size when using the auto document feeder as the original cover.
- When the dual scan document feeder is lowered under predetermined angle, the lever actuator presses the original cover angle detection lever of the MFP main body to turn ON the angle sensor.

### 7.2 DF open and close detection

- The magnet is installed to detect the open and close of the dual scan document feeder on the main body side.
- The original cover sensor on the main body will turn ON by the magnet when lowering the DF.

| [1] | Magnet | [2] | Original cover sensor (RS201) (Main body scanner <br> section) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Angle sensor (PS202) (Main body scanner section) | - | - |

## 8. FAN CONTROL

### 8.1 Function

- The cooling fan motor drives during original scanning to prevent the temperature of the drive motor from increasing.

| $[1]$ | Drawing in external air | $[2]$ | Discharging air outside of the machine |
| :--- | :--- | :--- | :--- |
| $[3]$ | Cooling fan motor (FM) | - | - |

### 8.2 Control condition

| Motor name | Control | Control conditions |
| :--- | :---: | :---: |
| Cooling fan moto (FM) | Stop | Standby state |
|  | Full speed | Original document feeding |

## PB THEORY OF OPERATION DF-629

## 1. CONFIGURATION

### 1.1 Section configuration

| $[1]$ | Document feed section | $[2]$ | Document registration section |
| :--- | :--- | :--- | :--- |
| $[3]$ | Document reading section | $[4]$ | Document switchback section |
| $[5]$ | Document exit section | - | - |

### 1.2 Paper path

### 1.2.1 1-sided paper path

### 1.2.2 2-sided paper path

### 1.3 Main part configuration

### 1.3.1 Main electrical part

| $[1]$ | Reading roll release motor (M5) | $[2]$ | Registration motor (M3) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Document feed motor (M2) | $[4]$ | DF cooling fan motor (FM1) |
| $[5]$ | DF control board (DFCB) | $[6]$ | Stamp Unit (SP-501) * option |
| $[7]$ | Glass cleaning motor (M4) | $[8]$ | Document reading motor (M1) |

### 1.3.2 Sensor

| $[1]$ | Upper door sensor (PS13) | $[2]$ | Document empty sensor (PS1) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Document length size sensor/1 (PS6) | $[4]$ | Document length size sensor/2 (PS7) |
| $[5]$ | Document width size sensor (VR1) | $[6]$ | Document reading glass cleaning sensor (PS12) |
| $[7]$ | Mixed original sensor/3 (PS10) | $[8]$ | Mixed original sensor/2 (PS9) |
| $[9]$ | Mixed original sensor/1 (PS8) | $[10]$ | Document reading sensor (PS4) |
| $[11]$ | Document exit sensor (PS5) | $[12]$ | After Separate sensor (PS2) |
| $[13]$ | Document registration sensor (PS3) | $[14]$ | Reading roll position sensor (PS11) |

### 1.3.3 Roller placement

| $[1]$ | Document pick-up roller | $[2]$ | Document separation roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Document feed roller | $[4]$ | Registration roller |
| $[5]$ | Document reading roller/1 | $[6]$ | Document reading glass cleaning roller |
| $[7]$ | Document reading roller/2 | $[8]$ | Document switchback exit roller |

## 2. DRIVE

### 2.1 Paper feed drive

| $[1]$ | Document feed motor (M2) | $[2]$ | After separate sensor (PS2) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Document feed roller | $[4]$ | Document separation roller |
| $[5]$ | Document pick-up roller | $[6]$ | Document empty sensor (PS1) |
| $[7]$ | Document pick-up roller | - | - |

- The document feed section consists of the document pick-up roller, document feed roller, as well as the document separation roller, and is directly driven by the document feed motor.
- When the start key is pressed, the document pick-up roller lowers to press the original, and the original is taken up and fed in. The original is transported to the registration roller by the document pick-up roller and document feed roller
- After the take-up and feeding sequence, the document feed motor is rotated backward, which raises the document pick-up roller.

### 2.2 Registration drive

| $[1]$ | Registration motor (M3) | $[2]$ | Document registration sensor (PS3) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Registration roller | $[4]$ | Registration roll |
| $[5]$ | Mixed original sensor/3 (PS10) | $[6]$ | Mixed original sensor/2 (PS9) |
| $[7]$ | Mixed original sensor/1 (PS8) | - | - |

- Timing at which to start transporting the original is controlled using the registration motor.
- The original is pressed against the registration roller and registration roll. This forms a loop in the original to thereby correct any skew in the original.
- Mixed original sensors/1, $2 /$, and $3 /$ detect width of the originals in the mixed original mode.

### 2.3 Document reading drive

| $[1]$ | Document reading motor (M1) | $[2]$ | Reading roll release motor (M5) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Document reading roller/1 | $[4]$ | Document reading roll |
| $[5]$ | Document reading sensor (PS4) | $[6]$ | Document reading roller/2 |
| $[7]$ | Document exit roller | $[8]$ | Stamp unit (SP-501) * option |
| $[9]$ | Document exit roller release solenoid (SD1) | $[10]$ | Document exit sensor (PS5) |

- The document reading motor drives the document reading section and document exit section.
- The document reading roll is equipped with a pressure/release mechanism. The pressure is released when the trailing edge of the original moves past the roller.
- The document reading motor rotates backward to allow the second feed of the original to be performed during switchback in the 2-sided mode.
- The document exit roll is equipped with a pressure/release mechanism. The pressure is released when the original is fed in a second time so that its second side can be read.

### 2.4 Document reading glass cleaning drive

| $[1]$ | Document reading roller | $[2]$ | Document reading sensor (PS4) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Glass cleaning motor (M4) | $[4]$ | Document reading glass cleaning sensor (PS12) |
| $[5]$ | Document reading glass cleaning brush | - | - |

- The glass cleaning motor drives the document reading glass cleaning brush.

The position of the cleaning brush is controlled by the document reading glass cleaning sensor.

## 3. OPERATION

### 3.1 Document feed section

### 3.1.1 Document set/empty detection

- When an original is loaded on the document feed tray, the document empty sensor detects that there is original.
- If no original is loaded when the document pick-up roller is in the standby position, the actuator blocks the document empty sensor and it is detected that no original is loaded.
- When an original is loaded on the document feed tray, the leading edge of the original pushes the actuator so that the document empty sensor is unblocked. It is detected that an original is loaded.
- When all pages of the original are fed in, the document empty sensor detects that there is no original on the document feed tray.

| $[1]$ | Document empty sensor (PS1) | O2] |
| :--- | :--- | :--- |

### 3.1.2 Document size detection mechanism

| $[1]$ | Document length size sensor/1 (PS6) | $[2]$ | Document width size sensor (VR1) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Mixed original sensor/1 (PS8) | $[4]$ | Document reading sensor (PS4) |
| $[5]$ | Mixed original sensor/3 (PS10) | $[6]$ | Mixed original sensor/2 (PS9) |
| $[7]$ | Document width guide | $[8]$ | Document length size sensor/2 (PS7) |

| $[1]$ | Adjust the document width guide plates (center alignment) | $[2]$ | Document width guide plates |
| :--- | :--- | :--- | :--- |
| $[3]$ | Original (standard mode) | $[4]$ | Align the original with narrow width with the rear side of <br> the document width guide plates (rear alignment) |
| $[5]$ | Original with narrow width (mixed original mode) | $[6]$ | Original with wide width (mixed original mode) |

## (1) Detecting the width of the original

- The width of the original is set on the document feed tray will be detected by the document width size sensor.
- A variable resistor is incorporated in the document width size sensor. Its resistance value varies in association with the movement of the document width guide.
- The original is to be loaded in the original feed tray by aligning it with reference to the center of the document feed tray in the standard mode. In the mixed original mode, the original is aligned to the rear side of the document width guide plate.

## (2) Detecting the length of the original

- The length of the original is set on the document feed tray will be detected by the document length size sensors $/ 1$ and $/ 2$.
- The document length size sensor/1 is a transmission type, while document length size sensor/2 is a reflection type. The document length size sensor/1 is detected by two actuators, that is, actuator/1 and actuator/2.
- When the document feed tray is not loaded with any originals, document length size sensor/1 is blocked. When an original is loaded and only actuator/1 is pressed, document length size sensor/1 is unblocked. When both actuator/1 and actuator/2 are pressed, a blocked document length size sensor/1 is detected by actuator/2.

| $[1]$ | Document length size sensor/1 (PS6) | $[2]$ | Actuator/1 |
| :--- | :--- | :--- | :--- |
| $[3]$ | Document length size sensor/2 (PS7) | $[4]$ | Actuator/2 |

## (3) Detecting the width of the original (in the mixed original/AMS mode)

- In the mixed original/AMS mode, no width is determined on the document feed tray; rather, the width is detected while the originals are being fed. Three mixed original sensors are disposed at positions immediately after the document feed section, functioning to detect the width of the original.
(4) Detecting the length of the original (in the mixed original/AMS mode)
- In the mixed original/AMS mode, no length is determined on the document feed tray; rather, the length of the original is calculated and determined based on the period of time during which the document reading sensor remains activated.

## (5) Document feed tray size detection

- The original size is determined by the combination of the results of detection made of the width and length of the original

| Document length size sensor/2 (PS7) |  | OFF | OFF | Reflector | Reflector |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Document length size sensor/1 (PS6) |  | Blocked | Unblocked | Unblocked | Blocked |
| Document width size sensor (VR1) | 114.5 | Postcard | B5S | A4S | A3 |
|  | 136 | B6S | B5S | A4S | A3 |
|  | 163 | A5S | B5S | A4S | A3 |
|  | 190.6 | B5S | B5S | A4S | A3 |
|  | 236.5 | A5 | Letter S | A4S | Foolscap |
|  | 266.2 | B5 | B4 | B4 | B4 |
|  | 286.2 | Letter | Ledger | Ledger | Ledger |
|  | (307) | A4 | A3 | A3 | A3 |

### 3.1.3 Pick-up roller up/down control

## (1) Up control

- When a job is completed, the document feed motor starts rotating backward. Then, the swing arm mounted on the same shaft as the document feed roller is rotated backward to thereby raise the original pick-up roller to the standby position.
- The document pick-up roller is fixed at the raised position by a torque limiter of the paper drive section.
- When the swing arm is raised to the standby position, the document stopper is lowered by its own weight and fixed by the lock pawl of the swing arm. The document stopper is unlocked when the swing arm lowers.
- The document stopper has two functions: one, to align the leading edges of the originals loaded in the standby state; and, two, to prevent the leading edge of the original from advancing over the pick-up position into the feed section.
[1]

[2]
[4]

| $[1]$ | Swing arm (standby position) | $[2]$ | Document stopper |
| :--- | :--- | :--- | :--- |
| $[3]$ | Swing arm (feed position) | $[4]$ | Document pick-up roller |

## (2) Down control

- When the start key is pressed, the document feed motor starts rotating forward. The rotation shaft of the swing arm mounted on the same shaft as the document feed roller is rotated forward, so that the original pick-up roller is lowered to the feed position.
- The document stopper is unlocked when the swing arm lowers.

### 3.1.4 Document feed/separation control

- When the start key is pressed, the document feed motor starts rotating forward, so that the document feed roller rotates forward.
- The rotation shaft of the swing arm mounted on the same shaft as the document feed roller is rotated forward, so that the document pick-up roller is lowered to the feed position. The document pick-up roller is rotated by a drive belt to thereby feed the original onto the document feed roller.

## (1) Separation/feed operation

1. The document separation roller is pressed up against, and driven by, the document feed roller. A torque limiter is mounted on the shaft of the document separation roller.
2. The acting pressure of the document feed roller/document separation roller/torque limiter serves as the limit torque for preventing double feed.
3. When there is no original or only one sheet of original between the document separation roller and the document feed roller, the limit torque is exceeded and the document separation roller follows the rotation of the document feed roller.
4. If there are two or more sheets of original between the document separation roller and the document feed roller, the limit torque is greater than the friction force of the original, so that the document separation roller stops rotating.
5. Because of the stationary document separation roller, the lower sheet of original in contact with the document separation roller is not fed in, so that the first sheet of original is original separated from the second sheet of original.

| $[1]$ | Document feed motor (M2) | $[2]$ | Document pick-up roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Document separation roller | $[4]$ | Document Feed roller |
| $[5]$ | Original | - | - |

## (2) Periodically replaced parts

- The document pick-up roller, document feed roller, and document separation roller are periodically replaced parts.
- At replacing the rollers, the paper feed assembly (document pick-up roller + document feed roller) and document separation roller must be replaced at the same time.
- Otherwise, the document pick-up roller, document feed roller, and document separation roller must be replaced at the same time.
- None of the document pick-up rollers, document feed rollers, and document separation roller are provided with a new article detection mechanism. When the three rollers are replaced with new ones, the "ADF Feed" counter must be reset to zero using "Counter / Life" of the Service Mode.
- The number of times the DF has been subjected to paper feed operations can be checked with the "ADF Feed" counter of the Service Mode.
Periodical replacement cycle $\quad$ Paper feed operations 200,000 times
- Refer to "Replacing the document roller assembly", "Replacing the paper feed assy.", "Replacing the separation roller assy" for methods of replacing document pick-up roller, document feed roller, document separation roller, and details of the Service Mode.
(a) Paper feed assembly

| $[1]$ | Document pick-up roller | $[2]$ | Paper feed assembly lock lever |
| :--- | :--- | :--- | :--- |
| $[3]$ | Document feed roller | - | - |

(b) Document feed roller / Document pick-up roller

| $[1]$ | Document feed roller | [2] |
| :--- | :--- | :--- |

(c) Document separation roller

### 3.1.5 Document separation roller pressure switching mechanism

- As a solution to misfeed problems when they occur, the pressure of the document separation roller can be changed as necessary.
- Inserting a spacer into a space below the spring that applies pressure to the document separation roller will increase the pressure.
- The pressure may be set in two steps selectable according to the direction in which the spacer is inserted.
- The spacer is disposed beside the document separation roller.
- For details, see "I.14.1.3 Adjusting the pressure of the separation roller".

### 3.2 Document registration section

### 3.2.1 Document registration outline

- The registration motor provides the drive for the registration roller.
- The original will create a loop between the document feed roller and the registration roller when the original is being conveyed in order to correct the skew.

### 3.2.2 Document registration loop formation process

1. The registration sensor detects the leading edge of the original.
2. The registration roller remains stationary.
3. Because the document feed roller (document switchback exit roller for the 2nd side of the original) continues rotating to feed the original, a loop is formed at the leading edge of the original.
4. The loop corrects skew in the original.
5. The registration roller is started to rotate to transport the original.

| $[1]$ | Original | $[2]$ | Document separation roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Document feed roller | $[4]$ | Loop formation (1st side) |
| $[5]$ | Document registration sensor (PS3) | $[6]$ | Registration roll |
| $[7]$ | Registration roller | $[8]$ | Loop formation (2nd side) |
| $[9]$ | Document switchback exit roller | - | - |

### 3.3 Document reading section

### 3.3.1 Transport mechanism

- The original transported from the document feed section will be transported to the document reading section by the registration roller, the document reading roller/1 and $/ 2$, and the document switchback exit roller.
- The registration roller is driven by the registration motor.
- The document reading roller/1 and $/ 2$ are driven by the document reading motor

| $[1]$ | Registration motor (M3) | $[2]$ | Document reading motor (M1) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Registration roller | $[4]$ | Document reading roller/1 |
| $[5]$ | Document reading roller/2 | - | - |

### 3.3.2 Document reading glass cleaning mechanism

## (1) DF original glass cleaning

- A reading line can occur if the DF original glass is contaminated with dust or dirt. The DF original glass cleaning mechanism prevents this fault from occurring.
- A half face of the document reading glass cleaning roller is provided with the document reading glass cleaning brush. While the original is being read, the document reading glass cleaning brush faces up. When the DF original glass is to be cleaned, the document reading glass cleaning roller rotates, so that the document reading glass cleaning brush faces the DF original glass.
- The document reading glass cleaning brush is drive by the glass cleaning motor.
- The position of the cleaning brush is controlled by the document reading glass cleaning sensor.

| $[1]$ | Document reading roller | $[2]$ | Document reading sensor (PS4) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Glass cleaning motor (M4) | $[4]$ | Document reading glass cleaning sensor (PS12) |

| $[7]$ | Document reading glass cleaning roller (standby <br> position) | $[8]$ | Cleaning brush section |
| $[9]$ | Document reading glass | - | - |

(2) Details of original reading glass cleaning

| Condition |  |  |
| :--- | :--- | :--- |
| Predrive | Power ON | Rotates the document reading glass cleaning brush one complete turn to check for its |
|  |  |  |

(a) *1: Despeckle mode setting screen

(b) *2: Feed cleaning settings screen

### 3.3.3 Document reading roll pressure/release control

- Rotation of the reading roll release motor drives the cam, which pushes the lever, so that the original reading roll is spaced apart from the document reading roller.
Pressure and release positions are detected by the reading roll position sensor.

| $[1]$ | Reading roll release motor (M5) | $[2]$ | Cam |
| :--- | :--- | :--- | :--- |
| $[3]$ | Reading roll position sensor (PS11) | $[4]$ | Lever |
| $[5]$ | Reading roll | $[6]$ | Document reading roller |

### 3.3.4 Document reading front guide

- Open the document reading guide to handle documents that are caught between the document reading roller/1 and the document reading roll.
- Open the original reading guide to clean the original reading roller/1 and the original reading sensor flock fabric.
- A spring is mounted to the document reading guide, therefore holding it by one hand is required at the time of handling a document. After you finished handling the document, release the hand holding the guide and return the guide to its normal position.
- No open-close sensor is mounted to the document reading guide.

| $[1]$ | Document reading roller/1 | $[2]$ | Document reading roll |
| :--- | :--- | :--- | :--- |
| $[3]$ | Flock fabric | $[4]$ | Document reading guide |
| $[5]$ | Original reading glass cleaning roller | - | - |

### 3.4 Document switchback/exit section

### 3.4.1 Document switchback/exit mechanism

- The original transported from the transport section will exit by the document reading roller/1, $/ 2$ and document switchback exit roller.
- In the 2 -sided mode, the document switchback exit roller is rotated backward and the original is fed to the registration roller again.
- The document switchback exit roller is driven by the document reading motor.

| $[1]$ | Registration motor (M3) | $[2]$ | Document reading motor (M1) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Registration roller | $[4]$ | Document reading roller/1 |
| $[5]$ | Document reading roller/2 | $[6]$ | Document switchback exit roller |

### 3.4.2 Switching mechanism for document switchback/exit

(1) Document switchback section

- The switchback path switching guide film provides a route toward the switchback path.
- In the 2-sided mode, the document switchback exit roller is rotated backward. This allows the trailing edge of the original to move along the upper side of the switchback path switching guide film to be fed to the switchback path, so that the original is fed to the registration roller.
- The switchback path switching guide film is fixed at all times.

| $[1]$ | Document switchback exit roller | $[2]$ | Switchback path switching guide film |
| :--- | :--- | :--- | :--- |
| $[3]$ | Registration roller | - | - |

### 3.4.3 Switchback exit roll pressure/retraction control

- Operation of the document exit roller release solenoid causes the lever to be pushed down and the document exit roll to be lowered, so that the document exit roll is spaced away from the document exit roller.
- This spacing operation is performed during switchback for reading of the back side of the originals and for putting pages in numerical order in the 2 -sided mode.

| $[1]$ | Document switchback exit roller | $[2]$ | Document exit roll |
| :--- | :--- | :--- | :--- |
| $[3]$ | Lever | $[4]$ | Document exit roller release solenoid (SD1) |

### 3.4.4 Faxed document stamp function

- Mounting optional "Stamp unit SP-501" allows a stamp to be placed on a faxed document.
- The stamp solenoid located upstream of the document exit roller is energized when the original is about to be fed out and the stamp mounted on the solenoid plunger is pressed against the surface of the original. This places a faxed mark ( + ) on the surface of the original.
- This function is enabled when "System2/Stamp/Set*1 (default setting: Unset)" is turned ON using the Service Mode and the user selects "Application/TX Stamp*2 (default setting: OFF)" on the "Scan/Fax" screen.
- This function is not used for "Copy" or "Scan".

| $[1]$ | Original | $[2]$ | Document switchback exit roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Stamp unit $(\mathrm{SP}-501)$ | - | - |

(1) *1: Stamp mounting setting screen
Systen Input

## (2) *2: TX Stamp setting screen

### 3.5 Paper path operation

### 3.5.1 1-sided mode

1. Pressing the start key will lower the document pick-up roller and press the original.
2. The document pick-up roller, document feed roller and document separation roller will start rotating to start feeding the first sheet of paper.
3. When the paper reaches the registration roller, a loop is formed in the paper. Then, the registration motor is started, so that the registration roller transports the paper.
4. The document feed motor is deenergized when a predetermined period of time elapses after the registration motor has been activated. The document reading motor will start running.
5. It starts reading from the leading edge of the original when the document reading sensor turned ON and the predetermined period of time has passed.
6. The document reading roll will be retracted right before the back edge of the original passes through the document reading roller/1. After a predetermined period of time, document reading roll will be pressed again to prepare for the next original.
7. The original will be exit by document reading roller/2 and the document exit roller.
8. All motors will turn OFF after the trailing edge of the original turns OFF the document exit sensor and the predetermined period of time is passed.

### 3.5.2 2-sided mode

1. In the same manner as in the 1 -side mode, the first side of the original is read.

2. After the original moves past document reading roller/2, the document reading motor is rotated backward and the original is transported to the switchback section.

3. It starts reading from the leading edge of the original when the document reading sensor turned ON and the specified period of time has passed.

4. To ensure that the front and back sides of the originals are in correct order, the original undergoes the similar switchback operation again before being fed into the tray.

### 3.6 DF open/close detection mechanism

### 3.6.1 Document exchange detection control

- An angle detection mechanism is provided to detect the operation of exchanging originals when the DF is used as the original cover of the main body.
- When the DF is raised to an angle of about 14.5 degrees or more, the detection lever is pushed up by a spring. The angle sensor that has been blocked by the detection lever is now unblocked. It is, as a result, detected that the DF "is raised to an angle of 14.5 degrees or more".
- When, on the other hand, the DF is lowered to an angle of about 14.5 degrees or less, the detection lever is pushed down. Then, the angle sensor, which has been unblocked, is blocked, so that it is detected that the DF "is lowered to an angle of 14.5 degrees or less".
- When the DF state undergoes changes from a condition of being fully lowered to a condition of "being raised to an angle of 14.5 degrees or more" and then to a condition of "being lowered to an angle of 14.5 degrees or less", it is determined that "an original is placed manually on the original glass". Then the original size detection control will be started.

### 3.6.2 DF open/close detection

- The magnet is installed to detect the open/close status of the DF on the main body side.
- The original cover sensor on the main body will turn ON by the magnet when lowering the DF.

| $[1]$ | Angle sensor (PS202) | $[2]$ | Original cover sensor (RS201) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Magnet | - | - |

### 3.7 Cooling inside the unit mechanism

- The DF cooling fan motor functions to cool the inside of DF, DF control board, and document feed motor in the DF.
- It discharges heat generated inside the DF out through the exhaust port.

$$
\begin{array}{|l|l|l}
\hline[1] & \text { DF cooling fan motor (FM1) } \\
\hline
\end{array}
$$

[2] DF control board (DFCB)

### 3.8 DF Skew(Front) adjustment mechanism

- The document feeder is installed to the scanner section of the machine and fixed with two hinges.
- The hinge on the right side of the machine is equipped with a DF skew (Front) adjustment mechanism.
- Turn the adjusting screw to move hinges backward or forward. It changes the relative installing position of the machine and DF. Also, it corrects the inclination of the first side image that is scanned using the CCD unit on the scanner section of the machine.

### 3.8.1 Hinge on the right side of the machine (front)

- Tighten the hinge fixing screw and turn the adjustment screw to move the hinge forward or backward. (The hinge moves forward or backward since the DF fixing plate is mounted to the machine)
- If the hinge moves towards the front side of the machine, the scale that is engraved on the hinge appears. (+ direction)
- If the hinge moves towards the rear side of the machine, the scale that is engraved on the hinge is hidden. (- direction)
- The amount of adjustment is read on a scale. (Default: 4 scales)
- The amount of correction to the hinge can be automatically measured through reading the adjustment chart in "ADF/DFSkew (Front)" of Service Mode.
See " I.14.1.2 Adjusting front side skew feed on ADF" for details about the "ADF/DFSkew (Front)".

## PC THEORY OF OPERATION DF-704

## 1. CONFIGURATION

### 1.1 Section configuration

| $[1]$ | Document feed section | $[2]$ | Document registration section |
| :--- | :--- | :--- | :--- |
| $[3]$ | 1-sided document reading section | $[4]$ | 2-sided document reading section |
| $[5]$ | Document exit section | - | - |

### 1.2 Paper path

- The same paper path is established in the 1 -sided mode and 2 -sided mode.
- In 1-sided mode, the CCD at the scanner section reads the image of the original. In 2-sided mode, at the same timing as that when the front side of the original is read by the CCD at the scanner section, the CIS in the DF reads the back side of the original. The speed at which the original is read in the 2 -sided mode is, therefore, the same that in the 1 -sided mode.

### 1.3 Main part configuration

### 1.3.1 Main electrical part

| $[1]$ | Reading roller release motor (M4) | $[2]$ | Document reading motor (M1) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Document feed motor (M2) | $[4]$ | CIS cleaning motor (M5) |
| $[5]$ | DF cooling fan motor (FM1) | $[6]$ | DF control board (DFCB) |
| $[7]$ | Stamp Unit (SP-501) * option | $[8]$ | CIS module (CIS) |
| $[9]$ | Document reading glass cleaning motor (M6) | $[10]$ | CIS power supply (CISPU) |
| $[11]$ | Registration motor (M3) | - | - |

### 1.3.2 Sensor

| $[1]$ | CIS cleaning sensor (PS7) | $[2]$ | Upper door sensor (PS14) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Document empty sensor (PS1) | $[4]$ | Document length sensor/1 (PS8) |
| $[5]$ | Document length sensor/2 (PS9) | $[6]$ | Document width sensor (VR1) |
| $[7]$ | Document exit sensor (PS5) | $[8]$ | CIS cover sensor (PS15) |
| $[9]$ | Document reading glass cleaning sensor (PS13) | $[10]$ | Mixed original sensor/3 (PS12) |
| $[11]$ | Mixed original sensor/2 (PS11) | $[12]$ | Mixed original sensor/1 (PS10) |
| $[13]$ | Document reading sensor (PS6) | $[14]$ | After separate sensor (PS2) |
| $[15]$ | Registration sensor (PS3) | $[16]$ | Reading roll position sensor (PS4) |

### 1.3.3 Roller placement

| $[1]$ | Document pick-up roller | $[2]$ | Document separation roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Document feed roller | $[4]$ | Registration roller |
| $[5]$ | Document reading roller/1 | $[6]$ | Document reading glass cleaning roller |
| $[7]$ | Document reading roller/2 | $[8]$ | CIS module (CIS) |
| $[9]$ | CIS cleaning brush | $[10]$ | Document reading roller/3 |
| $[11]$ | Document exit roller | - | - |

## 2. DRIVE

### 2.1 Paper feed drive

| $[1]$ | Upper door sensor (PS14) | $[2]$ | Document feed motor (M2) |
| :--- | :--- | :--- | :--- |
| $[3]$ | After separate sensor (PS2) | $[4]$ | Document feed roller |
| $[5]$ | Document separation roller | $[6]$ | Document pick-up roller |
| $[7]$ | Document empty sensor (PS1) | $[8]$ | Document pick-up roller |

- The document feed section consists of the document pick-up roller, document feed roller, as well as the document separation roller, and is directly driven by the document feed motor.
- When the start key is pressed, the document pick-up roller lowers to press the original, and the original is taken up and fed in. The original is transported to the registration roller by the document pick-up roller and document feed roller.
- After the take-up and feeding sequence, the document feed motor is rotated backward, which raises the document pick-up roller.

### 2.2 Registration drive

| $[1]$ | Registration roll | $[2]$ | Registration sensor (PS3) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Registration motor (M3) | $[4]$ | Registration roller |
| $[5]$ | Mixed original sensor/3 (PS12) | $[6]$ | Mixed original sensor/2 (PS11) |
| $[7]$ | Mixed original sensor/1 (PS10) | - | - |

- Timing at which to start transporting the original is controlled using the registration motor.
- The original is pressed against the registration roller and registration roll. This forms a loop in the original to thereby correct any skew in the original.
- Mixed original sensors/1, 2/, and $3 /$ detect width of the originals in the mixed original mode.

### 2.3 Document reading drive

| $[1]$ | Document reading motor (M1) | $[2]$ | Reading roller release motor (M4) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Reading roll position sensor (PS4) | $[4]$ | Document reading roll |
| $[5]$ | Document reading roller/1 | $[6]$ | Document reading sensor (PS6) |
| $[7]$ | Document reading roller/2 | $[8]$ | Document reading roller/3 |
| $[9]$ | Document exit roller | $[10]$ | Document exit sensor (PS5) |

- The document reading motor drives the document reading section and document exit section.
- The document reading roll is equipped with a pressure/release mechanism. The pressure is released when the trailing edge of the original moves past the roller.

### 2.4 Document reading glass / CIS glass cleaning drive

| $[1]$ | CIS cleaning motor (M5) | $[2]$ | CIS module (CIS) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Document reading glass cleaning motor (M6) | $[4]$ | Document reading glass cleaning sensor (PS13) |
| $[5]$ | Document reading glass cleaning brush | $[6]$ | CIS glass cleaning brush |
| $[7]$ | CIS cleaning sensor (PS7) | - | - |

- The document reading glass cleaning brush is rotated by the document reading glass cleaning motor and the glass surface is thereby cleaned.
- The CIS cleaning brush is rotated by the CIS cleaning motor and the CIS surface is thereby cleaned.
- The position of the cleaning brush is detected by the document reading glass cleaning sensor and the CIS cleaning sensor.

## 3. OPERATION

### 3.1 Document feed section

### 3.1.1 Document set/empty detection

- When an original is loaded on the document feed tray, the document empty sensor detects that there is original.
- If no original is loaded when the document pick-up roller is in the standby position, the actuator blocks the document empty sensor and it is detected that no original is loaded.
- When an original is loaded on the document feed tray, the leading edge of the original pushes the actuator so that the document empty sensor is unblocked. It is detected that an original is loaded.
- When all pages of the original are fed in, the document empty sensor detects that there is no original on the document feed tray.

| $[1]$ | Document empty sensor (PS1) | [2] Original |
| :--- | :--- | :--- |

### 3.1.2 Document size detection mechanism

| $[1]$ | Document length sensor/2 (PS9) | $[2]$ | Document length sensor/1 (PS8) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Document width sensor (VR1) | $[4]$ | Mixed original sensor/1 (PS10) |
| $[5]$ | Document reading sensor (PS6) | $[6]$ | Mixed original sensor/3 (PS12) |
| $[7]$ | Mixed original sensor/2 (PS11) | $[8]$ | Document width guide |

| $[1]$ | Adjust the document width guide plates (center alignment) | $[2]$ | Document width guide plates |
| :--- | :--- | :--- | :--- |
| $[3]$ | Original (standard mode) | $[4]$ | Align the original with narrow width with the rear side of <br> the document width guide plates (rear alignment) |
| $[5]$ | Original with narrow width (mixed original mode) | $[6]$ | Original with wide width (mixed original mode) |

## (1) Detecting the width of the original

- The width of the original is set on the document feed tray will be detected by the document width sensor.
- A variable resistor is incorporated in the document width sensor. Its resistance value varies in association with the movement of the document width guide.
- The original is to be loaded in the document feed tray by aligning it with reference to the center of the document feed tray in the standard mode. In the mixed original mode, the original is aligned to the rear side.

## (2) Detecting the length of the original

- The length of the original is set on the document feed tray will be detected by the document length sensors/1 and $/ 2$.
- The document length sensor/1 is a transmission type, while document length sensor/2 is a reflection type. The document length sensor/1 is detected by two actuators, that is, actuator/1 and actuator/2.
- When the document feed tray is not loaded with any originals, document length sensor/1 is blocked. When an original is loaded and only actuator/1 is pressed, document length sensor/1 is unblocked. When both actuator/1 and actuator/2 are pressed, a blocked document length sensor/1 is detected by actuator/2.

| $[1]$ | Document length sensor/1 (PS8) | $[2]$ | Actuator/1 |
| :--- | :--- | :--- | :--- |
| $[3]$ | Document length sensor/2 (PS9) | $[4]$ | Actuator/2 |

## (3) Detecting the width of the original (in the mixed original/AMS mode)

- In the mixed original/AMS mode, no width is determined on the document feed tray; rather, the width is detected while the originals are being fed. Three mixed original sensors are disposed at positions immediately after the document feed section, functioning to detect the width of the original.
(4) Detecting the length of the original (in the mixed original/AMS mode)
- In the mixed original/AMS mode, no length is determined on the document feed tray; rather, the length of the original is calculated and determined based on the period of time during which the document reading sensor remains activated.

## (5) Document feed tray size detection

- The original size is determined by the combination of the results of detection made of the width and length of the original.

| Document length sensor/2 (PS9) |  | OFF | OFF | Reflector | Reflector |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Document length sensor/1 (PS8) |  | Blocked | Unblocked | Unblocked | Blocked |
| Document width sensor (VR1) | 114.5 | Postcard | B5S | A4S | A3 |
|  | 136 | B6S | B5S | A4S | A3 |
|  | 163 | A5S | B5S | A4S | A3 |
|  | 190.6 | B5S | B5S | A4S | A3 |
|  | 236.5 | A5 | Letter S | A4S | Foolscap |
|  | 266.2 | B5 | B4 | B4 | B4 |
|  | 286.2 | Letter | Ledger | Ledger | Ledger |
|  | (307) | A4 | A3 | A3 | A3 |

### 3.1.3 Pick-up roller up/down control

(1) Up control

- When a job is completed, the document feed motor starts rotating backward. Then, the swing arm mounted on the same shaft as the document feed roller is rotated backward to thereby raise the document pick-up roller to the standby position.
- The document pick-up roller is fixed at the raised position by a torque limiter of the paper drive section.
- When the swing arm is raised to the standby position, the document stopper is lowered by its own weight and fixed by the lock pawl of the swing arm. The document stopper is unlocked when the swing arm lowers.
- The document stopper has two functions: one, to align the leading edges of the originals loaded in the standby state; and, two, to prevent the leading edge of the original from advancing over the pick-up position into the feed section.
[1]

[2]

[4]

| $[1]$ | Swing arm (standby position) | $[2]$ | Document stopper |
| :--- | :--- | :--- | :--- |
| $[3]$ | Swing arm (feed position) | $[4]$ | Document pick-up roller |

## (2) Down control

- When the start key is pressed, the document feed motor starts rotating forward. The rotation shaft of the swing arm mounted on the same shaft as the document feed roller is rotated forward, so that the document pick-up roller is lowered to the feed position.
- The document stopper is unlocked when the swing arm lowers.

### 3.1.4 Document feed/separation control

- When the start key is pressed, the document feed motor starts rotating forward, so that the document feed roller rotates forward.
- The rotation shaft of the swing arm mounted on the same shaft as the document feed roller is rotated forward, so that the document pick-up roller is lowered to the feed position. The document pick-up roller is rotated by a drive belt to thereby feed the original onto the document feed roller.

## (1) Separation/feed operation

1. The document separation roller is pressed up against, and driven by, the document feed roller. A torque limiter is mounted on the shaft of the document separation roller.
2. The acting pressure of the document feed roller/document separation roller/torque limiter serves as the limit torque for preventing double feed.
3. When there is no original or only one sheet of original between the document separation roller and the document feed roller, the limit torque is exceeded and the document separation roller follows the rotation of the document feed roller.
4. If there are two or more sheets of original between the document separation roller and the document feed roller, the limit torque is greater than the friction force of the original, so that the document separation roller stops rotating.
5. Because of the stationary document separation roller, the lower sheet of original in contact with the document separation roller is not fed in, so that the first sheet of original is original separated from the second sheet of original.

| $[1]$ | Document feed motor (M2) | $[2]$ | Document pick-up roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Document separation roller | $[4]$ | Document feed roller |
| $[5]$ | Original | - | - |

## (2) Periodically replaced parts

- The document pick-up roller, document feed roller, and document separation roller are periodically replaced parts.
- At replacing the rollers, the paper feed assembly (document pick-up roller + document feed roller) and document separation roller must be replaced at the same time.
- Otherwise, the document pick-up roller, document feed roller, and document separation roller must be replaced at the same time.
- None of the document pick-up rollers, document feed rollers, and document separation roller are provided with a new article detection mechanism. When the three rollers are replaced with new ones, the "ADF Feed" counter must be reset to zero using "Counter / Life" of the Service Mode.
- The number of times the DF has been subjected to paper feed operations can be checked with the "ADF Feed" counter of the Service Mode.

Periodical replacement cycle $\quad$ Paper feed operations 200,000 times

- For details of the applicable replacement procedures for the document pick-up roller, document feed roller, and document separation roller and the Service Mode, see "F.11.1.3 Replacing the paper feed assy." and "F.11.1.5 Replacing the separation roller assy."
(a) Paper feed roller assembly

| $[1]$ | Document pick-up roller | $[2]$ | Paper feed assembly lock lever |
| :--- | :--- | :--- | :--- |
| $[3]$ | Document feed roller | - | - |

(b) Document feed roller / Document pick-up roller

| $[1]$ | Document feed roller |
| :--- | :--- | [2] $\quad$ Document pick-up roller

(c) Document separation roller

### 3.1.5 Document separation roller pressure switching mechanism

- As a solution to misfeed problems when they occur, the pressure of the document separation roller can be changed as necessary.
- Inserting a spacer into a space below the spring that applies pressure to the document separation roller will increase the pressure.
- The pressure may be set in two steps selectable according to the direction in which the spacer is inserted.
- The spacer is disposed beside the document separation roller.
- For details, see "I.15.1.4 Adjusting the pressure of the separation roller".

### 3.2 Document registration section

### 3.2.1 Document registration outline

- The registration motor provides the drive for the registration roller.
- The original will create a loop between the document feed roller and the registration roller when the original is being conveyed in order to correct the skew.

### 3.2.2 Document registration loop formation process

1. The registration sensor detects the leading edge of the original.
2. The registration roller remains stationary.
3. Because the document feed roller continues rotating to feed the original, a loop is formed at the leading edge of the original.
4. The loop corrects skew in the original.
5. The registration roller is started to rotate to transport the original.

| $[1]$ | Original | $[2]$ | Document pick-up roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Document separation roller | $[4]$ | Document feed roller |
| $[5]$ | Loop formation | $[6]$ | Registration sensor (PS3) |
| $[7]$ | Registration roll | $[8]$ | Registration roller |

### 3.3 1-sided document reading section

### 3.3.1 Document reading section

- The document reading motor provides the drive for document reading roller/1/2/3, and the document exit roller.
- The original transported from the document registration section will be transported to the document exit section by document reading roller/1/2/3, and the document exit roller.
- When the leading edge of the original moves past the document reading roller/1, the document reading sensor (reflector type) disposed downstream of the roller detects the original. The length of the original is also detected based on the period of time during which the sensor remains activated.

| $[1]$ | Document reading motor (M1) | $[2]$ | Document reading roll |
| :--- | :--- | :--- | :--- |
| $[3]$ | Document reading roller/1 | $[4]$ | Document reading sensor (PS6) |
| $[5]$ | Document reading roller/2 | $[6]$ | Document reading roller/3 |
| $[7]$ | Document exit roller | - | - |

### 3.3.2 Document reading roll pressure/release control

- When the trailing edge of the original moves past document reading roller/1, document reading roller/1 acts to push the original, so that the document transport speed increases instantaneously. This results in an image being read unevenly. (Fluctuations in the document transport speed)
To prevent this problem from occurring, the document reading roll is released using the reading roller release motor. When the document reading roll is released, no thrust force is transmitted to the original.
- After the document reading roll is released, the original is transported only by rollers locating downstream of a reading position.

## (1) Pressure/release operation

- When the reading roller release motor is energized, the pressure/release gear is rotated and the cam mounted on the same shaft as the pressure/release gear is rotated.
- Then, the cam pushes down the rotation shaft of the document reading roll, so that the document reading roll is released from the document reading roller.
- The pressure/release gear is provided with a semi-circular light blocking plate. When the gear rotates a half turn, the reading roll position sensor is unblocked and blocked. Then, a condition is detected in which the document reading roll is released. (Blocked: released; unblocked: pressed)

[6]

| $[1]$ | Reading roller release motor (M4) | $[2]$ | Pressure/release gear |
| :--- | :--- | :--- | :--- |
| $[3]$ | Reading roll position sensor (PS4) | $[4]$ | Document reading roller/1 |
| $[5]$ | Document reading roll | $[6]$ | Document reading sensor (PS6) |

### 3.3.3 Document reading front guide

- Open the document reading guide to free documents that are trapped between the document reading roller/1 and the document reading roll.
- Open the original reading guide to clean the original reading roller/1 and the original reading sensor flock fabric.
- A spring is mounted to the document reading guide, therefore holding it by one hand is required at the time of handling a document. After you finished handling the document, release the hand holding the guide and return the guide to its normal position.
- No open-close sensor is mounted to the document reading guide.

| $[1]$ | Document reading guide | $[2]$ | Document reading roller/1 |
| :--- | :--- | :--- | :--- |
| $[3]$ | Flock fabric | $[4]$ | Document reading roll |
| $[5]$ | Document reading glass cleaning roller | - | - |

### 3.3.4 Document reading glass cleaning mechanism

## (1) DF original glass cleaning

- A line can occur in the image read from the original if the DF original glass is contaminated with dust or dirt. The DF original glass cleaning mechanism prevents this fault from occurring.
- A half face of the document reading glass cleaning roller is provided with the document reading glass cleaning brush. While the original is being read, the document reading glass cleaning brush faces up. When the DF original glass is to be cleaned, the document reading glass cleaning roller rotates, so that the document reading glass cleaning brush faces the DF original glass.
- The document reading glass cleaning roller rotates to remove dust sticking to the DF original glass.
- The document reading glass cleaning roller is rotated by the document reading glass cleaning motor. During cleaning, the document reading glass cleaning roller rotates forward (counterclockwise in the illustration) and, when the job is completed, it rotates backward (clockwise in the illustration).
- The drive coupling gear is provided with a light blocking plate. As the gear rotates, the document reading glass cleaning sensor is unblocked and blocked. This detects the document reading glass cleaning brush at its home position. (Unblocked: original reading position; Blocked: home position)

| $[1]$ | Document reading glass cleaning brush | $[2]$ | Document reading glass cleaning sensor (PS13) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Document reading glass cleaning motor (M6) | $[4]$ | Document reading glass cleaning roller (home position) |
| $[5]$ | Document reading glass cleaning roller (cleaning <br> position) | $[6]$ | DF original glass |

(2) DF original glass cleaning operation

| Condition |  | Cleaning operation |
| :---: | :---: | :---: |
| Predrive | Power ON | Rotates the document reading glass cleaning brush one complete turn to check for its correct operation. (forward rotation) |
|  | Exiting from sleep |  |
| Start key ON | Before starting reading | Rotates the document reading glass cleaning brush one complete turn to perform cleaning. (forward rotation: default setting) |
|  | During reading | Rotates the document reading glass cleaning brush one complete turn to perform cleaning for every two originals during continuous reading of originals. (forward rotation) |
|  |  | Rotates the document reading glass cleaning brush three complete turns to perform cleaning for each original during continuous reading of originals, if [Original Settings] -> [Despeckle] *1 is selected. (forward rotation) <br> Because the document reading glass cleaning brush is rotated three complete turns to perform the cleaning, however, the original-to-original distance is widened than at normal timing. This results in reduced productivity in reading the originals. |
|  |  | No original glass cleaning sequence is performed between originals during continuous reading of originals, if [System2] -> [ADF Scan Glass Contamin. Set.] -> [Feed Cleaning Settings] -> [0] *2 is selected in the Service Mode. |
|  | After completing reading last original | The document reading glass cleaning brush tends to curl if repeatedly operated in one direction only, resulting in poor cleaning performance. To straighten the brush, it is rotated one complete turn in the backward direction when reading of the last original is completed. (backward rotation) |

(a) *1: Despeckle mode setting screen

(b) *2: Feed cleaning settings screen

### 3.4 2-sided document reading section

### 3.4.1 CIS original reading mechanism

- The back side of the original is read by the CIS (contact image sensor) module. The image data read by the CIS is transferred to the main body.
- The CIS original reading section consists of the CIS module and CIS power supply.
- The light source of CIS module has used LED.

| $[1]$ | CIS module (CIS) | $[2]$ | Cleaning brush |
| :--- | :--- | :--- | :--- |
| $[3]$ | CIS cleaning motor (M5) | - | - |

- A cleaning brush to which a white plate is affixed is disposed on the side opposite the CIS module.
- "Document passage" is performed at the home position.
- "Shading correction", "gain adjustment", and "ADF Scan Glass Contamin. Sensitivity" are made using the shading surface.

| $[1]$ | White plate affixed | $[2]$ | CIS module (CIS) |
| :--- | :--- | :--- | :--- |
| $[3]$ | CIS glass | $[4]$ | Cleaning brush (Home position) |
| $[5]$ | Cleaning brush (Shading correction surface) | - | - |

### 3.4.2 CIS control when power is turned ON

1. The LEDs of CIS are turned ON.
2. The cleaning brush is detected at its home position.
3. The cleaning brush is rotated and brought to a stop at the gain adjustment position.

The gain adjustment is made twice with the cleaning brush at that position.
4. After the adjustments, the LEDs are turned OFF.
5. The cleaning brush is rotated and brought to a stop at the home position.

* The same control is performed when the main body exits from the sleep mode.

[1] CIS module (CIS) $\quad$ [2] Cleaning brush

### 3.4.3 CIS control when the document is loaded

1. The cleaning brush is detected at its home position.
2. The LEDs of CIS are turned ON.
3. The cleaning brush is rotated one complete turn.
4. The LEDs are turned OFF.
5. The cleaning brush is rotated and brought to a stop at the home position

## NOTE

- No operation is performed when the document is loaded if the following function is selected using the service mode: [System 2] $>$ [ADF Scan Glass Contamin. Set.] -> [Back Side] -> [ADF Scan Glass Contamin. Sensitivity] -> [Not Set].

### 3.4.4 CIS control when the start key is pressed

- This control is performed only in the 2-sided original reading mode.
(1) Before a print cycle / back side reading

1. The cleaning brush is detected at its home position.
2. The LEDs of CIS are turned ON.
3. The cleaning brush is rotated three complete turns.

The cleaning brush cleans the CIS glass during its first turn.
The cleaning brush uses the shading correction surface to perform the shading correction during its second and third turn.
4. With the LEDs ON, the cleaning brush is brought to a stop at its home position (waiting for the original).
5. The back side of the original is read as the original moves over the CIS.
(2) During a print cycle (operation between originals after reading)

The brush cleaning operation is normally performed each time the original is read.
If a print cycle produces a large number of printed pages continuously, however, either the cleaning operation or the shading correction operation is performed.
The shading correction operation is performed at predetermined intervals during a multiprint cycle in order to maintain an appropriate shading correction value.

## (a) Cleaning operation

1. The cleaning brush is rotated one complete turn.
(The cleaning brush normally makes one turn, but makes three turns in the despeckle mode.)
2. With the LEDs ON, the cleaning brush is brought to a stop at its home position (waiting for the original).
(b) Shading correction operation
3. The cleaning brush is rotated three complete turns.

The cleaning brush cleans the CIS glass during its first turn.
The cleaning brush uses the shading correction surface to perform the shading correction during its second and third turn. The shading correction is performed (a total of twice).
2. With the LEDs ON, the cleaning brush is brought to a stop at its home position (waiting for the original).

Home position

The original is passed with the cleaning brush at its home position.

Shading correction surface

The shading correction is performed using the shading correction surface.

| $[1]$ | CIS module (CIS) | $[2]$ | CIS glass |
| :--- | :--- | :--- | :--- |
| $[3]$ | Cleaning brush | - | - |

(c) After the print cycle

1. After the reading sequence, the LEDs are turned OFF.
2. The cleaning brush is turned backward (to tame the brush).
3. The cleaning brush is brought to a stop when its home position is detected.
4. The cleaning brush perform "ADF Scan Glass Contamin. Sensitivity".

- The LEDs are turned ON. The cleaning brush is rotated four complete turns.
- The cleaning brush cleans the CIS glass during its first turn.
- The cleaning brush uses the shading correction surface to perform the shading correction during its second and third turn. The shading correction is performed (a total of twice).
- The cleaning brush uses the shading correction surface to perform "ADF Scan Glass Contamin. Sensitivity" during its fourth turn.
- The cleaning brush is brought to a stop at its home position.
- The LEDs are turned OFF.

NOTE

- Steps of 4 is not performed if [Service Mode] -> [System 2] -> [ADF Scan Glass Contamin. Set.] -> [Back Side] -> [ADF Scan Glass Contamin. Sensitivity] -> [Not Set] is selected

### 3.4.5 CIS glass contamination prevention control

## (1) CIS glass cleaning

- The CIS glass is cleaned only when two sides of the original are to be read.
- When the back side cleaning motor is energized, the cleaning brush is rotated to remove dust and dirt from the surface of the CIS glass.
- Cleaning of the front side takes place at timing different from that of cleaning of the back side and the cleaning of the back side sources its power drive differently from the front side.
- The cleaning brush at its home position is detected by the CIS cleaning sensor.
- For details, see " PC.3.4.4 CIS control when the start key is pressed".

| $[1]$ | Cleaning brush | $[2]$ | CIS cleaning motor (M5) |
| :--- | :--- | :--- | :--- |
| $[3]$ | CIS cleaning sensor (PS7) | $[4]$ | CIS module (CIS) |

### 3.4.6 CIS cover

- During a misfeed clearing procedure, the CIS cover can be opened by releasing the lever.
- The CIS cover sensor is unblocked when the lever is released.

| $[1]$ | CIS module (CIS) | $[2]$ | CIS cover sensor (PS15) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Lever | $[4]$ | CIS cleaning roller |

### 3.5 Document exit section

### 3.5.1 Document exit mechanism

- The document reading motor provides the drive for the document exit roller. (the same drive source as that for the document reading section)
- As the document exit roller rotates forward, the original fed off from the document reading section is fed into the document exit tray.
- The original is exited to be detected by the document exit sensor.

| $[1]$ | Document reading motor (M1) | $[2]$ | Document reading roller/1 |
| :--- | :--- | :--- | :--- |
| $[3]$ | Document reading roller/2 | $[4]$ | Document reading roller/3 |
| $[5]$ | Document exit roller | $[6]$ | Document exit sensor (PS5) |

### 3.5.2 Faxed document stamp function

- Mounting optional "Stamp unit SP-501" allows a stamp to be placed on a faxed document.
- The stamp solenoid located upstream of the document exit roller is energized when the original is about to be fed out and the stamp mounted on the solenoid plunger is pressed against the surface of the original. This places a faxed mark (+) on the surface of the original.
- This function is enabled when "System2/Stamp/Set*1 (default setting: Unset)" is turned ON using the Service Mode and the user selects "Application/TX Stamp*2 (default setting: OFF)" on the "Scan/Fax" screen.
- This function is not used for "Copy" or "Scan".

| $[1]$ | Original | $[2]$ | Document exit roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Stamp unit $($ SP-501 $)$ | - | - |

## (1) *1: Stamp mounting setting screen

(2) *2: TX Stamp setting screen

### 3.6 Paper path operation

Reading of the back side of the original by the CIS is not done in the 1 -sided mode. All other paper feed operations in the 1 -sided mode are the same as those in the 2-sided mode.

| $[1]$ | Document pick-up roller | $[2]$ | Document feed roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Registration roller | $[4]$ | Document reading roller/1 |
| $[5]$ | Document reading roller/2 | $[6]$ | CIS module (CIS) |
| $[7]$ | Document reading roller/3 | $[8]$ | Document exit roller |

1. When the original is set, the document empty sensor detects the leading edge of the original.
2. Pressing the start key will lower the document pick-up roller and the document reading roller/1 will be pressed.
3. The document feed motor is energized, and the document pick-up roller and document feed roller are rotated to start feeding the first original.
4. When the registration sensor detects the leading edge of the original, a loop is formed in the original.
5. After the loop has been formed in the original, the registration motor is energized. The drive of the registration motor rotates the registration roller, so that the original is transported onto the reading section.
6. The document reading motor is energized after the lapse of a predetermined period of time after the registration motor has been energized. The drive of the document reading motor rotates document reading roller/1, document reading roller/2, document reading roller/3, and document exit roller.
7. After the lapse of a predetermined period of time after the document reading sensor has detected the leading edge of the original, reading of the front side of the original is started by the scanner.
8. The document reading roller/1 is retracted immediately before the trailing edge of the original moves past document reading roller/1. The document reading roller/1 in the retracted position is pressed again as soon as the trailing edge of the original moves past the front side reading position so as to be prepared for the next original.
9. When the leading edge of the original moves past the document reading roller/2, reading of the back side of the original is started by the CIS. (Reading of the back side of the original is done only in the 2 -sided mode.)
10. The document reading roller/3 is driven to transport the original onto the document exit section.
11. The document exit roller is driven to feed the original out.
12. The document reading motor is deenergized after the lapse of a predetermined period of time after the trailing edge of the original has deactivated the document exit sensor.

### 3.7 DF open/close detection mechanism

### 3.7.1 Document exchange detection control

- An angle detection mechanism is provided to detect the operation of exchanging originals when the DF is used as the original cover of the main body.
- When the DF is raised to an angle of about 14.5 degrees or more, the detection lever is pushed up by a spring. The angle sensor that has been blocked by the detection lever is now unblocked. It is, as a result, detected that the DF "is raised to an angle of 14.5 degrees or more".
- When, on the other hand, the DF is lowered to an angle of about 14.5 degrees or less, the detection lever is pushed down. Then, the angle sensor, which has been unblocked, is blocked, so that it is detected that the DF "is lowered to an angle of 14.5 degrees or less".
- When the DF state undergoes changes from a condition of being fully lowered to a condition of "being raised to an angle of 14.5 degrees or more" and then to a condition of "being lowered to an angle of 14.5 degrees or less", it is determined that "an original is placed manually on the original glass". Then the original size detection control will be started.

### 3.7.2 DF open/close detection

- The magnet is installed to detect the open/close status of the DF on the main body side.
- The original cover sensor on the main body will turn ON by the magnet when lowering the DF.

| $[1]$ | Angle sensor (PS202) | $[2]$ | Original cover sensor (RS201) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Magnet | - | - |

### 3.8 Cooling inside the unit mechanism

- The DF cooling fan motor functions to cool the inside of DF, DF control board, and document feed motor in the DF.
- It discharges heat generated inside the DF out through the exhaust port.

| [1] | DF cooling fan motor (FM1) | [2] |
| :--- | :--- | :--- |

### 3.9 DF skew adjustment mechanism

### 3.9.1 DF Skew(Front) adjustment mechanism

- The document feeder is installed to the scanner section of the machine and fixed with two hinges.
- The hinge on the right side of the machine is equipped with a DF skew (Front) adjustment mechanism.
- Turn the adjusting screw to move hinges backward or forward. It changes the relative installing position of the machine and DF. Also, it corrects the inclination of the first side image that is scanned using the CCD unit on the scanner section of the machine.

## (1) Hinge on the right side of the machine (front)

- Tighten the hinge fixing screw and turn the adjustment screw to move the hinge forward or backward. (The DF mounting plate is secured to the machine, therefore the hinge moves forward and backward)
- If the hinge moves towards the front side of the machine, the scale that is engraved on the hinge appears. (+ direction)
- If the hinge moves towards the rear side of the machine, the scale that is engraved on the hinge is hidden. (- direction)
- The amount of adjustment is read on a scale. (Default: 4 scales)
- The amount of correction to the hinge can be automatically measured through reading the adjustment chart in "ADF/DFSkew (Front)" of Service Mode.
See " I.15.1.2 Adjusting front side skew feed on ADF" for details about the "ADF/DFSkew (Front)".

| $[1]$ | Machine right-side hinge | $[2]$ | DF mounting plate |

| [1] | DF movement direction (hinge movement direction): - | $[2]$ | Home position |
| :--- | :--- | :--- | :--- |
| $[3]$ | DF movement direction (hinge movement direction): + | - | - |

### 3.9.2 DF Skew(Back) adjustment mechanism

- The DF skew (Back) adjustment mechanism is provided in the CIS module mounting area on the front DF frame.
- Rotation of the adjusting dial moves the CIS module left-right. It changes the relative position of the DF frame and CIS module. Also, it corrects the inclination of the second-side image that is scanned from the CIS module.

## (1) CIS module mounting area

- Loosen the two CIS adjusting plate fixing screws and turn the adjusting dial to move the adjusting plate left-right. The CIS module moves together.
- Turn the adjusting dial to the right to move the adjusting plate (CIS module) right (+)
- Turn the adjusting dial to the left to move the adjusting plate (CIS module) left (-)
- Read the adjustment amount from the reference line position. (Default: Center)
- The CIS adjusting plate correction amount can be measured automatically through scanning the adjustment chart in Service Mode "ADF/ DFSkew (Back)".
See " I.15.1.3 Adjusting back side skew feed on ADF" for details about the "ADF/DFSkew (Back)".

| $[9]$ | Tray 4 vertical transport motor (M122) | $[10]$ | Tray 3 paper feed motor (M111) |
| $[11]$ | Tray 3 vertical transport motor (M112) | - | - |

## 4. OPERATION

### 4.1 Paper feed section

### 4.1.1 Paper feed drive mechanism

- Tray 3 has a paper feed drive mechanism having the same arrangement as that of tray 4 . The paper feed drive mechanism is structured in the same manner as in tray 1 and tray 2 of the main body.
- Whereas operation is controlled using a clutch in tray 1 and tray 2 , tray 3 and tray 4 incorporates a paper feed motor that drives the pick-up roller and feed roller to feed the paper.
- Then, the vertical transport motor transports the paper through the vertical transport section.
- The pick-up roller takes up sheets of paper and the feed roller and separation roller ensure that only one sheet of paper is separated and fed into the main body.
- When the drawer is slid in, the lever is pushed to lower the pick-up roller.
- The tray is raised to cause the paper to push the feed roller. This raises the upper limit detection actuator, so that the upper limit is detected.
- The paper empty sensor detects when paper in the drawer runs out.

| $[1]$ | Tray 3/4 vertical transport sensor (PS113/PS123) | $[2]$ | Vertical transport roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Upper limit detection actuator | $[4]$ | Lever |
| $[5]$ | Tray 3/4 upper limit sensor (PS116/PS126) | $[6]$ | Tray 3/4 paper empty sensor (PS114/PS124) |
| $[7]$ | Empty detection actuator | $[8]$ | Pick-up roller |
| $[9]$ | Separation roller | $[10]$ | Tray 3/4 paper feed sensor (PS112/PS122) |
| $[11]$ | Feed roller | - | - |

### 4.1.2 Roller retract mechanism

- When the paper feed tray is inserted or pulled out, there is a mechanism which retracts the pick-up roller and the separation roller.
- The pick-up roller retracts from the paper.
- The separation roller retracts from the feed roller.

Front view

| $[1]$ | Feed roller | $[2]$ | Separation roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Separation roller pressure spring | $[4]$ | Paper |

| $[5] \quad$ Pick-up roller | $[6] \quad$ Pick-up roller pressure spring |
| :--- | :--- | :--- |

## (1) Pick-up roller retract mechanism

- When the paper feed tray is inserted or pulled out, the pick-up roller prevents the paper from being damaged.
- The pick-up roller comes down through spring pressure when the paper feed tray is closed. When paper is placed, the roller is pressed against the paper surface. (Paper feed position)
- If the paper feed tray lock is released, the roller lifting lever is also released and the pick-up roller holder is pushed up to the retraction position. This structure prevents the paper surface from being damaged even if the paper feed tray is pulled out.
Left side view

| $[1]$ | Roller lifting lever | $[2]$ | Pick-up roller holder |
| :--- | :--- | :--- | :--- |
| $[3]$ | Pick-up roller (retracted position) | $[4]$ | Paper |
| $[5]$ | Paper feed tray (lock released) | - | - |

## (2) Separation roller retract mechanism

- When a paper jam occurs and paper is caught between rollers where the feed roller is pressing the separation roller, paper will be left inside the machine through pulling out the paper feed tray. If you insert the paper feed tray in that state, the paper may get torn in pieces which may fall off and scatter inside the machine. It prevents paper from being torn or falling off through retracting the separation roller.
- The separation roller is pressed against the feed roller by spring pressure when the paper feed tray is closed. (Paper feed position)
- Release the paper feed tray lock, the roller pushdown lever is also released and the separation roller retract lever is pushed down to the retracting position. It releases the paper from the rollers even if it is jammed between the rollers.
Left side view

| $[1]$ | Roller pushdown lever | $[2]$ | Feed roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Separation roller (retract position) | $[4]$ | Separation roller retract lever |
| $[5]$ | Paper feed tray (lock released) | - | - |

### 4.1.3 Paper lifting motion

- The FD paper size board of each tray detects whether the drawer is slid in or out.
- When the FD paper size board is activated, the lift-up motor is energized to thereby raise the paper lifting plate.
- The paper stack of the tray pushes up the pick-up roller.
- When the upper limit position is detected by the upper limit sensor, it stops raising the paper lifting plate.
- As paper is consumed during the print cycle and the pick-up roller is lowered, the lift-up motor is energized until the upper limit sensor is blocked again.
(1) When the drawer is slid in

1. The paper lifting plate goes up and the top surface of the paper stack pushes up the pick-up roller.
2. The lifting motion stops as soon as the upper limit sensor detects the upper limit position.

[3]

| $[1]$ | Tray $3 / 4$ upper limit sensor (PS116/PS126) | $[2]$ | Pick-up roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper lifting plate B | $[4]$ | Paper lifting plate A |

## (2) During a print cycle

1. As the paper is consumed, the upper limit sensor is unblocked. Then the paper lifting plate goes up.

## [1] Tray 3/4 upper limit sensor (PS116/PS126)

### 4.2 Paper feed tray section

### 4.2.1 Paper size detection

- When the paper length guide of the drawer is moved, the circular paper length detection plate located on the bottom of the drawer turns.
- The paper length is detected by the lever that operates in conjunction with the paper length detection plate, and four paper length detection sensors on the FD paper size board.
- Moving the paper width guide plate activates or deactivates two paper width detection sensors on the CD paper size board through the cutout in the lever
- The combination of the four paper length detection sensors and two paper width detection sensors that are either activated or deactivated, determines the size of the paper loaded in the drawer.
- The FD paper length detection sensor detects that the drawer is slid into position as it is slid in.

| $[1]$ | Paper width guide plate (front) (PC-110/C210) | $[2]$ | Paper width guide plate (front) (PC-115/PC-215) |

| $[7]$ | Paper length detection plate | Paper length guide |
| :--- | :--- | :--- |

### 4.2.2 Paper feed tray locking mechanism

- The paper feed tray is provided with a locking mechanism.

## (1) Unlocking the paper feed tray

- With drawing the lever of the paper feed tray to the front will disengage the tray lock lever equipped on the right side of the paper feed tray.
- The paper feed tray can be pulled out of the machine by continuing pulling the lever with the tray lock lever disengaged.
- Rollers are provided for the right and left tray rails. They reduce the operating force required for sliding in/out the paper feed tray.

## (2) Locking the paper feed tray

- Pushing the lever of the paper feed tray all the way toward the rear will allow the paper feed tray to be slid into the machine.
- When the paper feed tray is inserted all the way in place, the tray lock lever equipped on the right side of the paper feed tray locks the tray in place.
- To prevent false detection, the paper feed tray is equipped with a spring in the rear that pushes the tray back out if the tray is not inserted all the way in place.

| $[1]$ | Lever of the paper feed tray | [2] Lock lever |
| :--- | :--- | :--- |

### 4.2.3 Paper feed tray stopper release mechanism (PC-115/PC-215)

- The paper feed tray is equipped with a stopper mechanism
- When paper is placed, the stopper prevents the paper feed tray from falling off from the machine even if it is pulled out.
- The paper feed tray can be removed if paper is remained inside the machine at the time of handling a paper jam or a misfeed.

## [1]

| $[3]$ | Tray 4 | $[4]$ | Tray 4 stopper |

(1) Releasing the paper feed tray stopper

- Press the stopper on its left side, the stopper lock will be released.
(2) Locking the paper feed tray stopper
- Press the stopper on its right side, the stopper lock will be locked. NOTE
- A mechanism is provided to push and lock the stopper through closing the paper feed tray to its home position even if you forget to lock it. (Mechanism to prevent forgetting lock)

### 4.2.4 Remaining paper display mechanism

- The amount of remaining paper is indicated by the LED on the right side of each tray and by the screen of the control panel.
- The estimate amount of paper for near empty is around 50 sheets.

## (1) Display state

| Tray status | Empty | Near empty | Other status <br> (During lifting-up and with tray not being <br> set included) |

## 4. OPERATION

### 4.1 Paper feed section

### 4.1.1 Paper feed drive mechanism

- The same paper feed drive mechanism as that found in PC-210/110 is incorporated.
- The paper feed motor drives the pick-up roller and feed roller to take up and feed a sheet of paper into the main body.
- Then, the vertical transport motor transports the paper through the vertical transport section.
- The pick-up roller takes up sheets of paper and the feed roller and separation roller ensure that only one sheet of paper is separated and fed into the main body.
- When the drawer is slid in, the lever is pushed to lower the pick-up roller.
- The tray is raised to cause the paper to push the feed roller. The tray is brought to a stop when the main tray upper limit sensor detects the upper limit.
- The main tray upper paper empty sensor detects whether paper is loaded on the main tray at the upper limit position.

| $[1]$ | Right bottom door sensor (PS131) | $[2]$ | Vertical transport motor (M132) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper feed motor (M131) | $[4]$ | Lever |
| $[5]$ | Main tray upper limit sensor (PS136) | $[6]$ | Pick-up roller |
| $[7]$ | Separation roller | $[8]$ | Main tray upper paper empty sensor (PS137) |
| $[9]$ | Paper feed sensor (PS132) | $[10]$ | Vertical transport sensor (PS133) |
| $[11]$ | Feed roller | $[12]$ | Vertical transport roller |

### 4.1.2 Roller retract mechanism

- When the paper tray is inserted or pulled out, there is a mechanism which retracts the pick-up roller and the separation roller.
- The pick-up roller retracts from the paper.
- The separation roller retracts from the feed roller.

Front view

| $[1]$ | Feed roller | $[2]$ | Separation roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Separation roller pressure spring | $[4]$ | Paper |
| $[5]$ | Pick-up roller | $[6]$ | Pick-up roller pressure spring |

## (1) Pick-up roller retract mechanism

- When the paper tray is inserted or pulled out, the pick-up roller prevents the paper from being damaged.
- The pick-up roller comes down through spring pressure when the paper tray is closed. When paper is placed, the roller is pressed against the paper surface. (Paper feed position)
- If the paper tray lock is released, the roller lifting lever is also released and the pick-up roller holder is pushed up to the retraction position. This structure prevents the paper surface from being damaged even if the paper tray is pulled out.
Left side view

| $[1]$ | Roller lifting lever | $[2]$ | Pick-up roller holder |
| :--- | :--- | :--- | :--- |
| $[3]$ | Pick-up roller (retract position) | $[4]$ | Paper |
| $[5]$ | Paper tray (lock released) | - | - |

## (2) Separation roller retract mechanism

- When a paper jam occurs and paper is caught between rollers where the feed roller is pressing the separation roller, paper will be left inside the machine through pulling out the paper tray. If you insert the paper tray in that state, the paper may get torn in pieces which may fall off and scatter inside the machine. It prevents paper from being torn or falling off through retracting the separation roller
- The separation roller is pressed against the feed roller by spring pressure when the paper tray is closed. (Paper feed position)
- Release the paper tray lock, the roller pushdown lever is also released and the separation roller retract lever is pushed down to the retracting position. It releases the paper from the rollers even if it is jammed between the rollers.

Left side view

| $[1]$ | Roller pushdown lever | $[2]$ | Feed roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Separation roller (retract position) | $[4]$ | Separation roller retract lever |
| $[5]$ | Paper tray (lock released) | - | - |

### 4.2 Main tray section

### 4.2.1 Main tray up / down mechanism

- The elevator tray is suspended by the cables at the front and rear.
- As the elevator motor turns forward or backward, the cables are wound to raise or lower the tray.
- The amount of paper left in the main tray is calculated using time for the lifting motion (period of time through which the elevator motor is kept energized).
- When the amount of paper becomes small, the near empty detection actuator blocks the main tray paper near empty sensor
- When paper in the main tray runs out, the main tray paper empty sensor detects that condition and a descent motion of the main tray is started.
- The shifter stop/lower limit position sensor detects the main tray at its lower limit position.

| $[1]$ | Main tray paper near empty sensor (PS135) | $[2]$ | Elevator motor (M134) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Near empty detection actuator | $[4]$ | Main tray |
| $[5]$ | Shifter stop / lower limit position sensor (PS138) | $[6]$ | Main tray paper empty sensor (PS134) |
| $[7]$ | Wire | - | - |

### 4.2.2 Main tray lower limit detection

## (1) Main tray lower limit detection

- If the sub tray is detected to be loaded with paper when paper on the main tray runs out, the descent motion of the main tray is started.
- The shifter stop/lower limit position sensor detects the lower limit position of the main tray.
- This sensor has two functions and detects also the stop position of the shifter.
- The shift stop position detection actuator portion detects the shifter stop position when it is pushed as a result of the lever being pushed by the shifter.

| $[1]$ | Lower limit detection actuator portion | $[2]$ | Shifter stop position detection actuator portion |
| :--- | :--- | :--- | :--- |
| $[3]$ | Shifter stop / lower limit position sensor (PS138) | $[4]$ | Lever |

## (2) Main tray lower operation

- If the sub tray is detected to be not loaded with paper when paper on the main tray runs out, the descent motion of the main tray is not performed. The main tray is lowered when the drawer is slid out.
- When the drawer is slid out, the elevator motor is disengaged from the gear, so that the main tray lowers by its own weight.
- At this time, an effect of the damper connected to the gear prevents the main tray from lowering swiftly and ensures a slow descent motion.

| $[1]$ | Elevator motor (M134) | $[2]$ | Damper |
| :--- | :--- | :--- | :--- |
| $[3]$ | Main tray | - | - |

### 4.3 Sub tray section

### 4.3.1 Shifter drive mechanism

- If the main tray runs out of paper, while the sub tray is loaded with paper, the paper stack on the sub tray is moved to the main tray.
- The shifter motor drives the belt, which moves the shifter to thereby move the paper stack.
- The shifter moves to the position of the shifter stop/lower limit position sensor. Then, the shifter motor is rotated backward to return the shifter to, and stop it at, the position at which the shifter home sensor is blocked.

| $[1]$ | Shifter motor (M133) | $[2]$ | Division board sensor (PS142) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Sub tray paper remaining amount sensor (PS141) | $[4]$ | Sub tray paper empty sensor (PS140) |
| $[5]$ | Shifter | $[6]$ | Shifter home sensor (PS139) |
| $[7]$ | Belt | $[8]$ | Shifter stop / lower limit position sensor (PS138) |

### 4.3.2 Sub tray paper remaining amount

- The amount of paper left on the sub tray, is detected by the combination of states of the sub tray paper remaining amount sensor and the sub tray paper empty sensor. The amount of paper left is detected at three different levels.
- Roughly speaking, the sub tray paper remaining amount sensor is deactivated from the activated state when the amount of paper left is about half the capacity of the tray.

| Paper remaining amount | Sub tray paper remaining amount sensor | Sub tray paper empty sensor |
| :---: | :---: | :---: |
| Large | ON | ON |
| Small | OFF | ON |
| None | OFF | OFF |

| $[1]$ | Sub tray paper remaining amount sensor (PS141) | $[2]$ | Sub tray paper empty sensor (PS140) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper | - | - |

### 4.4 Remaining paper amount displayed mechanism

- The amount of remaining paper is indicated by the LED on the right side of each tray and by the screen of the control panel.
- The estimate amount of paper for near empty is around 100 as $64 \mathrm{~g} / \mathrm{m}^{2}(17 \mathrm{lb})$ paper.

### 4.4.1 Display state

| Tray status | Empty | Near empty | Other status |
| :---: | :---: | :---: | :---: |

|  |  |  | (During lifting-up and with tray not being set <br> included) |
| :---: | :---: | :---: | :---: |
| LED status | Lit | OFF/Blink * | Unlit |

## NOTICE

- The near empty display may be OFF or Blink as set for within "Machine State LED Setting" of the service mode. (The default setting is OFF.)
- The LED is OFF regardless of the amount of paper left in the tray in the energy save mode.

Tray paper remaining amount display LED

[1] Tray paper remaining amount display LED $\quad$ -

## 5. OPERATION

### 5.1 Unit open/close section

### 5.1.1 Unit lock mechanism

- The link between the paper feed unit and MFP can be released.
- If the sensor determines that the paper feed unit is released, printing from the paper feed unit is prohibited.

| $[1]$ | Mounting plate (back): On the MFP | $[2]$ | Lock (back) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Lock (front) | $[4]$ | Unit release lever |
| $[5]$ | LU set sensor/Fr (PS7) | $[6]$ | Actuator |
| $[7]$ | Mounting plate (front): On the MFP | $[8]$ | Lock pin (on the MFP) |
| $[9]$ | Coupling rail | $[10]$ | LU set sensor/Rr (PS1) |

## (1) Description

- Operate the unit release lever in the front side of the large capacity paper feed unit (hereinafter referred to as paper feed unit), the locks (on both sides of front and back) attached to the left side of the paper feed unit will be released. It releases the link between the paper feed unit and the MFP, which makes it possible to slide the paper feed unit to the right.
- The paper feed unit is connected to the MFP via the coupling rail. The unit slides to the right side along the rail.
- When the paper feed unit link is released, the LU set sensor/Fr and the LU set sensor/Rr will be unblocked. As a result, the sensor determines that paper feed unit has been released.
- The LU set sensor is installed in the front and rear sides. These sensors are used to prevent the paper feed unit from being linked to the MFP at an angle.
- If the sensor determines that the paper feed unit is released, printing from the paper feed unit is prohibited. (Printing from other paper feed ports is still possible.)
- The paper feed unit is linked to the MFP through sliding the unit to the left. The home position when the paper feed unit is linked is fixed with the lock pin on the MFP.
- Link the paper feed unit, printing from the paper feed unit will be enabled.

### 5.1.2 LU door open/close detection mechanism

- The LU door is equipped with a door switch.
- Open the LU door, the paper tray lift-up drive section link will be released.

## (1) Description

- An LU door switch is provided at the top-right-rear side of the paper feed unit and detects the opening and closing of the LU door.
- When the LU door is closed, the open/close detection lever on the LU door pushes down the LU door switch. (ON)
- If the sensor determines that the LU door is open, printing from the paper feed unit is prohibited. (Printing from other paper feed ports is still possible.)
- Open the LU door, the paper tray lift-up drive link will be released.
- Close the LU door, the paper tray lift-up drive section will be connected and printing from the paper feed unit will be enabled.

### 5.2 Paper storage section

### 5.2.1 Paper tray lifting mechanism

- When the LU door is closed, the wire is wound around the lift-up axis, which raises the paper tray.
- Detection of the upper limit of paper stops the wire winding process to complete the paper tray lifting operation.

## (1) Description

- Four wires are connected to the paper tray which lifts up the tray into its home position.
- Each wire is wound around the lift-up axis. Roll up a lift-up axis, the paper tray will be lifted up.
- The wire in the lift-up axis which is connected to the drive assist spring is also wound in the same direction. By the force of the drive assist spring, the unloaded paper tray (with no paper placed) is lifted up into the home position. (It does not go down to the lowest position)
- With the weight of the paper that is placed on the paper tray, the paper tray will be lowered down. The amount of lowering of the paper tray varies by paper weight.
- When the paper tray is lowered from the home position, upward force is applied to the paper tray by the drive assist spring. It decreases the load on the lift-up axis when paper is lifted up.
- This machine does not have a mechanism to detect the home position and lower limit position of the paper tray.
- Close the LU door, so that the LU lift-up motor and paper tray lifting mechanism are linked together.
- The LU lift-up motor rotates to wind the wires around the lift-up axis and lift up the paper tray. Thus, the surface of the paper is pressed against the pick-up roller.
- Open the LU door, the coupling of the LU lift-up motor and paper tray lifting mechanism will be disconnected. Thus, the paper tray will fall down with its own weight, which releases the pressure between the pick-up roller and the paper.
- The remaining paper detection plate also rotates together with the vertical movement of the paper tray. (The wire in the lift-up axis which is connected to the remaining paper detection plate is wound in the opposite direction)

## (2) Operation timing

## When paper is placed

1. The $L U$ door is opened and paper is placed. (The $L U$ door switch detects whether the $L U$ door is closed or not)
2. With the LU door closed, the LU upper limit sensor signal is checked. When the paper tray is being lowered (LU upper limit sensor is unblocked), the LU lift-up motor is rotated and the paper tray lift-up is started.
3. The pick-up roller is pushed up by paper surface that was lifted up. The pick-up roller holder blocks the LU upper limit sensor, which detects the paper raising up to the upper limit position.
4. If the LU upper limit sensor detects the paper raising up to the upper limit position, the LU lift-up motor stops to end the lift-up operation of the paper tray.

[5]

| $[1]$ | LU upper limit sensor (PS2) | $[2]$ | Pick-up roller holder |
| :--- | :--- | :--- | :--- |
| $[3]$ | Pick-up roller | $[4]$ | Paper |
| $[5]$ | Paper tray | $[6]$ | LU paper empty sensor actuator |
| $[7]$ | LU paper empty sensor (PS4) | - | - |

## During a print cycle

1. When the amount of paper decreases during a print cycle, the pick-up roller will gradually come down. Thus, the LU upper limit sensor that was blocked by the pick-up roller holder becomes unblocked.
2. The LU lift-up motor will rotate again to start lifting up the paper tray.
3. The pick-up roller is pushed up by paper surface that was lifted up. Thus, the pick-up roller holder will block the LU upper limit sensor
4. If the LU upper limit sensor gets blocked, the LU lift-up motor stops to end the lift-up operation of the paper tray.
5. Repeat above operations, the pressure (paper feed pressure) between the pick-up roller and the paper stack is kept constant regardless of the amount of remaining paper.

| $[1]$ | LU upper limit sensor (PS2) | $[2]$ | Pick-up roller holder |
| :--- | :--- | :--- | :--- |
| $[3]$ | Pick-up roller | $[4]$ | Paper tray |

### 5.2.2 Paper tray lift-up drive release mechanism

- The paper tray lift-up drive section is equipped with a drive release mechanism.
- Release the drive, the paper tray will come down.
- The contact of the pick-up roller on the paper is released when the paper tray comes down.

(1) Drive release operation

1. The wire linked to the LU door pulls down the link release plate when the door is opened.
2. The link release plate pushes out the link gear towards the front of the main body. It releases the link to the drive gear coupling.
3. Release the LU lift-up motor driving force, the weight of the load on the paper tray will pull out the wire wound in the lift-up axis. (The liftup axis rotates on the opposite direction). This movement lowers the paper tray.
(2) Drive link operation
4. Close the LU door, the spring that is linked to the link release plate will pull up the link release plate.
5. The link gear pushes it back inside the machine through the spring force. It completes the link to the drive gear coupling.

### 5.2.3 Paper guide plate

- Change of the installation position of the paper guide plate allows the size of actual paper to be changed.
- The large capacity unit is not equipped with a mechanism to automatically detect paper size.

| [1] $\quad$ Paper guide plate (width) | [2] | Paper guide plate (length) |
| :--- | :--- | :--- |

## (1) Description

- Change of the installation position of the paper guide plate allows the size of actual paper to be changed.
- If the installation position of the paper guide plate has been changed, configure the paper size from [Service Mode] -> [System 2] -> [LCT Paper Size Setting].
- Available paper sizes: A3, B4, A4/A4S, A3 Wide (12 $1 / 4 \times 18$ ), and SRA3

### 5.3 Paper feed/transport section

### 5.3.1 Paper feed control

- The LU paper feed motor drives the rollers to feed paper.

| $[1]$ | LU paper feed motor (M2) | $[2]$ | Feed roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Pick-up roller | $[4]$ | Torque limiter |

| $[5]$ | Separation roller (Only one sheet of paper in the sample <br> illustration so it is in driven rotation) | [6] Paper |
| :--- | :--- | :--- |
| $[7]$ | Drive relay gear | - |

## (1) Description

- The LU paper feed motor drives the pick-up roller, feed roller and separation roller to take up and feed a sheet of paper into the main body.
- The weight is applied to the pick-up roller holder. The pick-up roller is pressed against the paper by the weight.
- Sheets of paper are separated and fed individually into the machine by the feed roller and separation roller.
- A torque limiter is connected to the separation roller which controls the driving force of the LU paper feed motor.

When there is no sheet of paper or only one sheet of paper between the separation roller and feed roller, the limit torque is exceeded and the separation roller follows the rotation of the feed roller.

- If multiple sheets of paper are fed between the separation roller and feed roller, the limit torque gets greater than the frictional force of the paper. Thus, the separation roller rotates reversely. The lower sheets of paper which are in contact with the separation roller are pushed back to the paper tray and separated.
(a) Feed roller pressure mechanism

| $[1]$ | Weight | $[2]$ | Pick-up roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Feed roller | - | - |

### 5.3.2 Paper feed control

- The transport roller is driven following the rotation of the LU transport motor to transport paper to the paper feed section of the main body. Layout of sensors and rollers

| $[1]$ | LU paper feed sensor (PS3) | $[2]$ | Transport roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Feed roller | $[4]$ | Tray 2 vertical transport roller |
| $[5]$ | Tray 2 vertical transport sensor | - | - |

## (1) Description

- In consecutive print, when the interval between the preceding and following sheets is below the specified value, the LCT transport rollers temporarily stop to ensure a predetermined interval.
- The paper transport speed is faster than the system speed.

### 5.3.3 Periodical replacement parts

- The pick-up roller, feed roller, and separation roller are periodical replacement parts.

## NOTE

- These three rollers must be replaced with new ones at the same time.

| $[1]$ | Pick-up roller | $[2] \quad$ Feed roller and separation roller |
| :--- | :--- | :--- |

## (1) Description

- None of the pick-up roller, feed roller, and separation roller is provided with a new article detection mechanism. When the three rollers are replaced with new ones, the [LCT Parts] counter must be reset from [Service Mode] -> [Counter] -> [Life].
- The number of times the paper feed unit has been subjected to paper feed operations can be checked with the "LCT Parts" counter of the Service Mode.

### 5.3.4 Remaining paper level detection

- Detection of remaining paper is determined depending on the status of LU near empty sensors/1 and 2 .

Back view of the large capacity unit (paper full state)

| $[1]$ | Lift-up axis | $[2]$ | LU near empty sensor /2 (PS6) |
| :--- | :--- | :--- | :--- |
| $[3]$ | LU near empty sensor /1 (PS5) | $[4]$ | Paper lift-up plate |
| $[5]$ | Spring | $[6]$ | Remaining paper detection plate |
| $[7]$ | Sensor blocking plate | - | - |

## (1) Description

- The paper tray is equipped with a mechanism which detects the amount of remaining paper.
- The wire in the lift-up axis which is connected to the remaining paper detection plate is wound reversely against the paper tray wire. (If the paper tray wire is wound up the lift-up axis, the same amount of wire is pulled out.)
- A spring is attached to the rotation axis of the remaining paper detection plate. Rotational force is applied in the direction of winding of the wire into the remaining paper detection plate.
- Detection of remaining paper is determined depending on the status of LU near empty sensors/1 and 2 .

## (2) Remaining paper detection operation

1. If paper on the paper tray is consumed, the lift-up axis is rotated and the paper tray is lifted up.
2. If the lift-up axis is rotated in the lift direction of the paper tray, the wire that is connected to the remaining paper detection plate is pulled out from the lift-up axis
3. The remaining paper detection plate rotates for an amount that the wire is pulled out, and winds up the wire
4. The remaining paper detection plate is equipped with a blocking plate. The position of the blocking plate changes depending on the rotation amount of the remaining paper detection plate.
5. The amount of remaining paper is determined depending on the detection status of LU near empty sensors/1 and 2.
(3) Criteria for determining the amount of remaining paper

| Condition | Paper full | LU near full | Paper present | LU near empty |
| :--- | :---: | :---: | :---: | :---: |
| Remaining paper level * | 3000 to 2000 <br> sheets | 2000 to 1000 <br> sheets | 1000 to 51 sheets | 50 to 1 sheets *2 |
| LU near empty sensor /1 (PS5) | Blocked | Blocked | Unblocked | Unblocked |
| LU near empty sensor /2 (PS6) | Unblocked | Blocked | Blocked | Unblocked |

- *1: Reference value when plain paper is placed
- *2: The accuracy of the determination of the near empty number is 50 sheets $\pm 20$ sheets.

### 5.3.5 Paper empty detection

- The LU paper empty sensor detects the paper empty states.

| $[1]$ | LU paper empty sensor (PS4) | $[2]$ | LU upper limit sensor (PS2) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Pick-up roller holder | $[4]$ | Paper tray |
| $[5]$ | Actuator (paper present) | $[6]$ | Paper |
| $[7]$ | Actuator (LU paper tray empty) | - | - |

## (1) Description

- The LU paper empty sensor detects the paper empty states.
- The absence of paper is determined when the paper tray is raised up to the upper limit position. (The LU upper limit sensor detects the upper limit position of the paper tray.)
(a) When paper is left on the paper tray

1. If the paper tray is raised up to the upper limit position, the actuator is pushed up by the top of the paper.
2. If the actuator blocks the LU paper empty sensor, the sensor determines that paper is remaining on the tray.
(b) When no paper is left on the paper tray
3. Since the paper tray has a notch, the actuator does not move from the LU paper empty position even if the paper tray is raised up to the upper limit position.
4. If the LU paper empty sensor remains unblocked, it determines that there is no paper left (LU paper empty).
5. When LU paper empty is detected, the paper tray stays at the upper limit position.

### 5.3.6 Remaining paper display

- An LED on the front right side displays the amount of remaining paper.

[1]
[1] Tray LED display
(1) Status indicator list

| Paper feed port status |  |
| :--- | :--- |
| - Empty | Lit |
| - Near empty | Blinking |
| - Paper present | Unlit |
| - Other than near |  |
| empty |  |
| - Being lifted up |  |

## 3. OPERATION

### 3.1 Unit open/close section

### 3.1.1 Unit lock mechanism

- Operate the unit release lever in the front side of the large capacity paper feed unit (hereinafter referred to as paper feed unit), the locks (on both sides of front and back) attached to the left side of the paper feed unit will be released. It releases the link between the paper feed unit and the MFP, which makes it possible to slide the paper feed unit to the right.
- The paper feed unit is connected to the MFP via the coupling rail. The unit slides to the right side along the rail.
- Release the paper feed unit link, the LU set sensor gets unblocked and the sensor determines that the paper feed unit is released.
- If the sensor determines that the paper feed unit is released, printing from the paper feed unit is prohibited. (Printing from other paper feed ports is still possible.)
- The paper feed unit is linked to the MFP through sliding the unit to the left. The home position when the paper feed unit is linked is fixed with the lock pin on the MFP.
- Link the paper feed unit, printing from the paper feed unit will be enabled.

| $[1]$ | Mounting plate (back): On the MFP | $[2]$ | Lock (back) |
| :--- | :--- | :--- | :--- |
| $[3]$ | LU door switch (MS1) | $[4]$ | Unit release lever |
| $[5]$ | Lock (front) | $[6]$ | Mounting plate (front): On the MFP |
| $[7]$ | Lock pin (on the MFP) | $[8]$ | Coupling rail |
| $[9]$ | LU set sensor (PS1) | $[10]$ | Actuator |

### 3.1.2 LU door open/close detection mechanism

- An LU door switch is provided at the top-right-rear side of the paper feed unit and detects the opening and closing of the LU door.
- When the LU door is closed, the open/close detection lever on the LU door pushes down the LU door switch. (ON)
- If the sensor determines that the LU door is open, printing from the paper feed unit is prohibited. (Printing from other paper feed ports is still possible.)
- Open the LU door, the paper tray lift-up drive section link will be released.
- Close the LU door, the paper tray lift-up drive section will be connected and printing from the paper feed unit will be enabled.

| $[1]$ | LU door | $[2]$ | LU door open/close detection lever |
| :--- | :--- | :--- | :--- |
| $[3]$ | LU door switch $($ MS1 $)$ | - | - |

### 3.2 Paper storage section

### 3.2.1 Paper tray lifting mechanism

- Four wires are connected to the paper tray which lifts up the tray into its home position.
- Each wire is wound around the lift-up axis. Roll up a lift-up axis, the paper tray will be lifted up.
- The wire in the lift-up axis which is connected to the drive assist spring is also wound in the same direction. By the force of the drive assist spring, the unloaded paper tray (with no paper placed) is lifted up into the home position. (It does not go down to the lowest position)
- With the weight of the paper that is placed on the paper tray, the paper tray will be lowered down. The amount of lowering of the paper tray varies by paper weight.
- When the paper tray is lowered from the home position, upward force is applied to the paper tray by the drive assist spring. It decreases the load on the lift-up axis when paper is lifted up.
- This machine does not have a mechanism to detect the home position and lower limit position of the paper tray.
- Close the LU door, so that the LU lift-up motor and paper tray lifting mechanism are linked together.
- The LU lift-up motor rotates to wind the wires around the lift-up axis and lift up the paper tray. Thus, the surface of the paper is pressed against the pick-up roller.
- Open the LU door, the coupling of the LU lift-up motor and paper tray lifting mechanism will be disconnected. Thus, the paper tray will fall down with its own weight, which releases the pressure between the pick-up roller and the paper.
- The remaining paper detection plate also rotates together with the vertical movement of the paper tray. (The wire in the lift-up axis which is connected to the remaining paper detection plate is wound in the opposite direction)

## (1) Operation timing

(a) When paper is placed

1. The LU door is opened and paper is placed. (The LU door switch detects whether the LU door is closed or not)
2. With the LU door closed, the LU upper limit sensor signal is checked. When the paper tray is being lowered (LU upper limit sensor is unblocked), the LU lift-up motor is rotated and the paper tray lift-up is started.
3. The pick-up roller is pushed up by paper surface that was lifted up. The pick-up roller holder blocks the LU upper limit sensor, which detects the paper raising up to the upper limit position.
4. If the LU upper limit sensor detects the paper raising up to the upper limit position, the LU lift-up motor stops to end the lift-up operation of the paper tray.

| $[1]$ | LU upper limit sensor (PS2) | $[2]$ | Pick-up roller holder |
| :--- | :--- | :--- | :--- |
| $[3]$ | Pick-up roller | $[4]$ | Paper |
| $[5]$ | Paper tray | $[6]$ | LU paper empty sensor actuator |
| $[7]$ | LU paper empty sensor (PS4) | - | - |

## (b) During a print cycle

1. When the amount of paper decreases during a print cycle, the pick-up roller will gradually come down. Thus, the LU upper limit sensor that was blocked by the pick-up roller holder becomes unblocked.
2. The LU lift-up motor will rotate again to start lifting up the paper tray.
3. The pick-up roller is pushed up by paper surface that was lifted up. Thus, the pick-up roller holder will block the LU upper limit sensor.
4. If the LU upper limit sensor gets blocked, the LU lift-up motor stops to end the lift-up operation of the paper tray.
5. Repeat above operations, the pressure (paper feed pressure) between the pick-up roller and the paper stack is kept constant regardless of the amount of remaining paper.

| $[1]$ | LU upper limit sensor (PS2) | $[2]$ | Pick-up roller holder |
| :--- | :--- | :--- | :--- |
| $[3]$ | Pick-up roller | $[4]$ | Paper tray |

### 3.2.2 Paper tray lift-up drive release mechanism

- The paper tray lift-up drive section is equipped with a drive release mechanism.
- Release the drive, the paper tray will come down.
- The contact of the pick-up roller on the paper is released when the paper tray comes down.

Rear view

(1) Drive release operation

1. The wire linked to the LU door pulls down the link release plate when the door is opened.
2. The link release plate pushes out the link gear towards the front of the main body. It releases the link to the drive gear coupling.
3. Release the LU lift-up motor driving force, the weight of the load on the paper tray will pull out the wire wound in the lift-up axis. (The liftup axis rotates on the opposite direction). This movement lowers the paper tray.
(2) Drive link operation
4. Close the LU door, the spring that is linked to the link release plate will pull up the link release plate.
5. The link gear pushes it back inside the machine through the spring force. It completes the link to the drive gear coupling.

### 3.2.3 Paper size detection

- The LCT does not have a function to detect the paper size.
- Specify the paper size in [Service Mode] -> [System 2] -> [LCT Paper Size Setting].

SCttinger size

### 3.3 Paper feed/transport section

### 3.3.1 Paper feed and transport control

## (1) Paper feed control

- The LU paper feed motor drives the pick-up roller, feed roller and separation roller to take up and feed a sheet of paper into the main body.
- The weight is applied to the pick-up roller holder. The pick-up roller is pressed against the paper by the weight.

| $[1]$ | LU paper feed motor (M2) | $[2]$ | Feed roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Pick-up roller | $[4]$ | Torque limiter |
| $[5]$ | Separation roller (Only one sheet of paper in the sample <br> illustration so it is in driven rotation) | $[6]$ | Paper |
| $[7]$ | Drive relay gear | - | - |

- Sheets of paper are separated and fed individually into the machine by the feed roller and separation roller.
- A torque limiter is connected to the separation roller which controls the driving force of the LU paper feed motor.
- When there is no sheet of paper or only one sheet of paper between the separation roller and feed roller, the limit torque is exceeded and the separation roller follows the rotation of the feed roller.
- If multiple sheets of paper are fed between the separation roller and feed roller, the limit torque gets greater than the frictional force of the paper. Thus, the separation roller rotates reversely. The lower sheets of paper which are in contact with the separation roller are pushed back to the paper tray and separated.

| $[1]$ | Weight | $[2]$ | Pick-up roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Feed roller | - | - |

## (2) Paper transport control

- The transport roller is driven following the rotation of the LU transport motor to transport paper to the paper feed section of the main body.
- In consecutive print, when the interval between the preceding and following sheets is below the specified value, the LCT transport rollers temporarily stop to ensure a predetermined interval.
- The paper transport speed is faster than the system speed.

Layout of sensors and rollers

| $[1]$ | LU paper feed sensor (PS3) | $[2]$ | Transport roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Feed roller | $[4]$ | Tray 2 vertical transport roller |
| $[5]$ | Tray 2 vertical transport sensor | - | - |

## (3) Periodical replacement parts

- The pick-up roller, feed roller, and separation roller are periodical replacement parts.

## NOTE

- These three rollers must be replaced with new ones at the same time.
- None of the pick-up roller, feed roller, and separation roller is provided with a new article detection mechanism. When the three rollers are replaced with new ones, the [LCT Parts] counter must be reset from [Service Mode] -> [Counter] -> [Life].
- The number of times the paper feed unit has been subjected to paper feed operations can be checked with the "LCT Parts" counter of the Service Mode.

Feed roller/Pick-up roller/Separation roller

## [1] Pick-up roller $\quad$ [2] Feed roller/Separation roller

### 3.3.2 Remaining paper level detection

- The paper tray is equipped with a mechanism which detects the amount of remaining paper.
- Detection of remaining paper is determined depending on the status of LU near empty sensors/1 and 2 .

## Rear view

| $[1]$ | Paper lift-up plate | $[2]$ | Lift-up axis |
| :--- | :--- | :--- | :--- |
| $[3]$ | Spring | $[4]$ | Remaining paper detection plate |
| $[5]$ | LU near empty sensor/2 (PS6) | $[6]$ | LU near empty sensor/1 (PS5) |
| $[7]$ | Sensor blocking plate | - | - |

## (1) Remaining paper detection operation

1. If paper on the paper tray is consumed, the lift-up axis is rotated and the paper tray is lifted up.
2. The wire in the lift-up axis which is connected to the remaining paper detection plate is wound reversely against the paper tray wire. If the lift-up axis is rotated in the lift direction of the paper tray, the wire that is connected to the remaining paper detection plate is pulled out from the lift-up axis.
3. A spring is attached to the rotation axis of the remaining paper detection plate. Rotational force is applied in the direction of winding of the wire into the remaining paper detection plate. The remaining paper detection plate rotates for an amount that the wire is pulled out, and winds up the wire.
4. The remaining paper detection plate is equipped with a blocking plate. The position of the blocking plate changes depending on the rotation amount of the remaining paper detection plate.
5. The amount of remaining paper is determined depending on the detection status of LU near empty sensors/1 and 2 .
(2) Criteria for determining the amount of remaining paper

| Condition | Paper full | Paper near full | Paper present | Paper near-empty |
| :--- | :---: | :---: | :---: | :---: |
| Remaining paper level * | 3000 to 2000 <br> sheets | 2000 to 1000 <br> sheets | 1000 to 51 sheets | 50 to 1 sheets *2 |
| LU near empty sensor/1 (PS5) | Blocked | Blocked | Unblocked | Unblocked |
| LU near empty sensor/2 (PS6) | Unblocked | Blocked | Blocked | Unblocked |

- *1: Reference value when plain paper is placed
- *2: The accuracy of the determination of the near empty number is 50 sheets $\pm 20$ sheets.

### 3.3.3 Paper empty detection

- The LU paper empty sensor detects the paper empty states.
- The absence of paper is determined when the paper tray is raised up to the upper limit position. (The LU upper limit sensor detects the upper limit position of the paper tray.)

| $[1]$ | LU paper empty sensor (PS4) | $[2]$ | LU upper limit sensor (PS2) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Pick-up roller holder | $[4]$ | Paper tray |
| $[5]$ | Actuator (paper present) | $[6]$ | Paper |
| $[7]$ | Actuator (paper tray empty) | - | - |

(1) When paper is left on the paper tray

1. If the paper tray is raised up to the upper limit position, the actuator is pushed up by the top of the paper.
2. If the actuator blocks the LU paper empty sensor, the sensor determines that paper is remaining on the tray.

## (2) When no paper is left on the paper tray

1. Since the paper tray has a notch, the actuator does not move from the paper empty position even if the paper tray is raised up to the upper limit position.
2. If the LU paper empty sensor remains unblocked, it determines that there is no paper left (paper empty).
3. When paper empty is detected, the paper tray stays at the upper limit position.

### 3.3.4 Remaining paper display

- An LED on the front right side displays the amount of remaining paper.
- The following table shows display statuses.

| Paper feed port <br> status | Empty | Near empty | Not empty, Not near empty, Currently on lift-up |
| :---: | :---: | :---: | :---: |
| LED status | Lit | Blinking | Unlit |

[1] Tray LED display - -

## PH THEORY OF OPERATION JS-506

## 1. OVERVIEW OF THE SEPARATOR

- The separator JS-506 is installed to the MFP to enable both "exit tray 1 " and "exit tray 2 " to use. So you can exchange the paper exit port.
- Tray 2 has a shift mechanism and a sorting function can be added.

[^54]
## 2. PAPER PATH

### 2.1 Paper feed to the exit tray

- *: Not used in bizhub C368/C308/C258.

4. DRIVE

### 4.1 Paper transport drive mechanism for exit tray 1

- A reverse roller on the MFP main unit side transports paper to the exit tray 1. NOTE
- Refer to MFP paper exit/reverse unit for details on the drive mechanism for the reverse roller.
[1]

| [1] Exit tray 1 | [2] | Switchback roller (MFP main body; paper exit/reverse <br> section) * |
| :--- | :--- | :--- |

- *: The roller shape, roller configuration, and drive method is changed when the JS-506 is installed to the MFP.

### 4.2 Paper transport drive mechanism for exit tray 2

- A reverse roller on the MFP side transports paper to the exit tray 2.

NOTE

- Refer to MFP paper exit/reverse unit for details on the drive mechanism for the exit roller.

| [1] Exit tray 2 | [2] Exit roller (MFP main body; paper exit/reverse section) * |
| :--- | :--- | :--- |

- *: The roller shape, roller configuration, and drive method is changed when the JS-506 is installed to the MFP.

### 4.3 Exit tray 2 shift drive mechanism

- A shift tray motor conducts shift drive of the exit tray 2.

[3]

| $[1]$ | Exit tray 2 | $[2]$ | Tray shift motor (M1) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Exit tray support rolls (6 points) | $[4]$ | Shift control actuator |
| $[5]$ | Tray shift home sensor (PS1) | - | - |

## 5. OPERATION

### 5.1 Exit tray 1

### 5.1.1 Paper transport

- The JS-506 exit tray 1 does not have a paper transport mechanism. Paper transport is performed by a reverse roller in the MFP.
- The paper exit/reverse switch gate is switched to the reverse roller side when the paper is transported to the reverse roller.
- The reverse roller stops after the predetermined period of time when the exit sensor on the main body detects the trailing edge of the last paper.
NOTE
- The paper exit/reverse unit mechanism and control details are changed when the JS-506 is installed to the MFP.

| $[1]$ | Paper exit/reverse switch gate (reverse roller side) | $[2]$ | Paper exit sensor (main body: PS3) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Exit tray 1 | $[4]$ | Exit tray 1 full detection lever |
| $[5]$ | Reverse roller (main body) | - | - |

### 5.1.2 Paper full detection

- The exit tray 1 has the exit tray 1 full sensor which detects paper full.

The sensor detects paper full with either 100 sheets of plain paper or stack height of 22.5 mm or less.
NOTE

- Paper may curl depending on the type of paper and the temperature and humidity of the room where the device is installed. The stacked sheets may be reduced depending on the amount of paper curl.

## (1) Paper not present

| $[1]$ | Exit tray 1 | $[2]$ | Exit tray1 full sensor (PS2) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Exit tray 1 full detection lever: unblocked | - | - |

(2) Paper full

[1] Paper $\quad[2] \quad$ Exit tray 1 full detection lever: blocked

### 5.2 Exit tray 2

### 5.2.1 Paper transport

- The JS-506 exit tray 2 does not have a paper transport mechanism. Paper transport is performed by a paper exit roller in the MFP.
- The paper exit/reverse switching gate does not move, since it is in the default position (paper exit roller side).
- The paper exit roller stops after the predetermined period of time when the paper exit sensor on the main body detects the trailing edge of the last paper.

## NOTE

- The paper exit/reverse unit mechanism and control details are changed when the JS-506 is installed to the MFP.

| $[1]$ | Paper exit/reverse switch gate (exit roller side) | [2] | Paper exit sensor (main body: PS3) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Exit tray 2 | $[4]$ | Exit roller |

### 5.2.2 Paper shift mechanism

- Move paper alternately between the front side and the rear side of the exit tray 2 to sort paper.
- The shift mechanism operates when the "Shift output each job" is selected in default setting or when the offset function is selected on the control panel.
- The tray shift home sensor detects the home position for the exit tray 2.
- The exit tray 2 shifts to the home position when the power is on and the printing starts for the 1 st job.
- Repeatedly move the paper between the rear side and front side of the exit tray 2 to sort paper in the exit tray 2
(1) Exit tray 2: Home position
[2]

[4]

| [1] | Tray shift motor (M1) | $[2]$ | Shift control actuator |
| :--- | :--- | :--- | :--- |

(2) Exit tray 2: shift position

[2]

| [1]Tray shift projection: Shift position (rear side of the exit <br> tray 2) | [2] $\quad$ Tray shift home sensor (PS1): blocked |
| :--- | :--- | :--- |

(3) Outline of exit tray 2 shift operation

| $[5]$ | Tray shift projection: Home position | [6] | Tray shift projection: Home position (exit tray 2, bottom <br> view) |
| :--- | :--- | :--- | :--- |
| $[7]$ | Shift control actuator (exit tray 2, bottom view) | - | - |

### 5.2.3 Paper full detection

- The exit tray 2 does not have a paper full detection mechanism. If the exited paper exceeds the maximum number of stacked sheets, it may cause paper to spill out from the exit tray or jam.
The maximum number of sheets stacked for the exit tray 2 is 150 sheets for plain paper.

## NOTE

- Pay attention not to allow paper in the exit tray to exceed the maximum number of stacked sheets when a large number of sheets is printed continuously.
- Paper may curl depending on the type of paper and the temperature and humidity of the room where the device is installed. The stacked sheets may be reduced depending on the amount of paper curl.

## (1) Extension tray

- An extension tray is installed to the rear end of the exit tray 2 to accommodate large-sized paper (A3, ledger paper, and so on).
- Make sure to pull out the extension tray before the printing of large-sized paper.

| [1] | Extension tray: Used for printing large-sized paper | [2] | Extension tray: Used for printing small-sized paper |
| :--- | :--- | :--- | :--- |
| $[3]$ | Exit tray 2 | - | - |

## PI THEORY OF OPERATION FS-533/PK-519

## 1. FINISHER OUTLINE

- Install the staple finisher FS-533 to the MFP to enable the following functions. "Sort function, Sort offset function", "Group function, Group offset function", "Staple function" and "Sort staple function" can be added.
- The "Punch function" can be added by installing the optional function (Punch Kit PK-519)

| Option |  |
| :--- | :--- |
| PK-519 | Punch function |

## 2. PAPER PATH

| $[7]$ | Alignment roller | $[8]$ | Paper conveyance roller |

## 3. CONFIGURATION

### 3.1 Section configuration

- The staple finisher FS-533 has the finisher main unit that is installed on the paper exit section of the MFP.
- Slide out the finisher from the MFP for maintenance and other operations. Slide out the finisher main unit to access the finisher operation section and the punch kit. (only when the optional punch kit kit is installed)
- The staple finisher has the sort/group mechanism and the staple mechanism as standard. The optional punch kit PK-519 can be installed between the right face of the finisher and the paper exit section of the main body.

## 4. UNIT OPEN/CLOSE SECTION

### 4.1 Unit lock mechanism

- The finisher (FS-533) and punch kit (PK-519) are provided in the each unit lock mechanism.

Overall view

| $[1]$ | Punch unit lock mechanism | [2] $\quad$ Finisher unit lock mechanism |
| :--- | :--- | :--- |

### 4.1.1 Finisher unit lock mechanism

- Releasing the finisher release lever at the front side of the finisher releases the locking claws at the front and rear sides of the finisher from the finisher slide rail. The finisher and the MFP will be disconnected to enable the finisher to slide to the left.
- When the finisher is slid, the finisher lock switch turns off to detect that the finisher is opened
- When the finisher is detected to be opened, the warning message will be displayed on the screen to inform that the unit is open. Following jobs will then be prohibited.
- Closing the finisher releases the warning screen to releases the job prohibition.

## Front view

| $[1]$ | Finisher release lever | $[2]$ | Finisher lock switch (SW1) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Lock claw | - | - |

### 4.1.2 Punch unit lock mechanism (PK-519)

- When the finisher is opened, the release lever for the punch unit will be exposed. (only when the optional punch kit PK-519 is installed)
- The punch unit does not have a mechanism to detect open/close of the unit. NOTE
- The function to detect open/close of the punch unit is not installed since the finisher needs to be opened to open the punch unit.
Front view

| $[1]$ | Punch unit release lever | [2] Lock claw |
| :--- | :--- | :--- | :--- |

## 5. PUNCH SECTION (PK-519)

### 5.1 Configuration

- The punch function can be added to the finishing mode by installing the optional punch kit PK-519 to the finisher FS-533.
- At the punch section, the paper that is transported from the MFP paper exit section is punched when it is fed into the finisher.
- When punching the holes on the paper, the paper transported to the transport section will be switch backed to the punch section to correct the paper skew before punching the holes. Punching is conducted paper by paper. The punched paper will be transported from the punch section to the transport section
- When the number of punch holes is not commanded at "Finishing", the paper will be transported to inside the finisher without switchback of the paper and punching.
- 2 hole/3 hole punch kits as well as 2 hole/4 hole punch kits have mechanisms to switch the number of punch holes. NOTE
- 2 holes punch kit and 4 holes punch kit do not have the function to switch the number of punch holes.
" "Finishing" cannot be selected using a different punch kit. (Example: Three holes punch mode cannot be selected when the 4 holes punch kit is installed.)
- Punch dust generated by punching is received in the punch dust box.

[2]

| $[1]$ | Punch unit | [2] |
| :--- | :--- | :--- |

| $[1]$ | Punch unit release lever | $[2]$ | Puncher *1 |

- *1: The number of the puncher is varied depending on the type of punch kit.
- *2: The shape of the puncher frame is varied depending on the type of punch kit.

### 5.1.1 Punch kit type

2 holes/3 holes kit (Selectable the hole number)

[^55]2 holes/4 holes kit (Selectable the hole number)

## - Attachable marketing area: Europe, US, Others 1-5

2 holes punch kit

- Attachable marketing area: Japan

4 holes punch kit

- Attachable marketing area: Europe

### 5.2 Drive

- The drive source for the punch section is a punch motor. It drives the puncher and the punch dust agitating blade.
- The puncher is driven via the puncher drive cam.
- The punch dust agitating blade is driven via the agitating blade drive connecting lever. The agitating blade drive connecting lever has the function to detect punch dust full.
Overall view

| $[1]$ | Puncher frame*1 | $[2]$ | Registration guide |
| :--- | :--- | :--- | :--- |
| $[3]$ | Puncher *2 | $[4]$ | Paper feed sensor (PS201) |
| $[5]$ | Slide came | $[6]$ | Puncher home sensor (PS204) |
| $[7]$ | Cam slide shaft | $[8]$ | Puncher drive cam |
| $[9]$ | Puncher drive cam sensor (PS203) | $[10]$ | Punch dust full sensor (PS205) |
| $[11]$ | Punch motor (M201) | $[12]$ | Punch dust agitating blade |
| $[13]$ | Punch dust box | - | - |

- *1: The shape of the puncher frame is varied depending on the type of punch kit.
- *2: The number of the puncher is varied depending on the type of punch kit.

## NOTE

- The illustration explains with an example for "2 holes/4 holes kit".
- The slide cam has a guide. With the shape of the guide and the difference shift value of the puncher frame, only the specified puncher can be moved down.
" The " 2 holes kit" and the " 4 holes kit" do not have the punch hole switching function.
Enlarged view of the punch dust agitating blade drive section

[5]

| $[1]$ | Punch motor sensor (PS202) | $[2]$ | Encoder |

| $[3]$ | Punch dust agitating blade | $[4]$ | Punch dust agitating blade drive connecting lever |
| $[5]$ | Punch dust full sensor (PS205) | $[6]$ | Punch motor (M201) |

### 5.3 Operation

### 5.3.1 Skew correction mechanism

- When in punch mode, the paper is transported to the paper transport section of the finisher once and switchbacked to make the paper contact the registration guide. This process will correct the skew at the rear edge of the paper (tilt) to enable punching at the proper position.
Overall view

| $[1]$ | Puncher | $[2]$ | Paper feed sensor (PS201) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Registration guide | $[4]$ | Paper feed sensor (PS101) |
| $[5]$ | Receiving roller | $[6]$ | Paper conveyance roller |

Front view

| $[1]$ | Paper feed sensor (PS201) | $[2]$ | Puncher |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper conveyance motor (M101) | $[4]$ | Paper feed sensor (PS101) |
| $[5]$ | Receiving roller | $[6]$ | Paper conveyance roller |
| $[7]$ | Punch motor (M201) | $[8]$ | Registration guide |

(1) Skew correction process

1. The paper conveyance motor [2] of the finisher will rotate forward, and the paper conveyance roller [4] will rotate forward. The paper will be transported for the punch section to the transport section.
2. The paper feed sensor [3] (PS101) will detect the front edge of the paper, and the paper feed sensor [1] (PS201) will detect the rear edge of the paper.
3. When the paper feed sensor [1] (PS201) detects the rear edge of the paper and the specified period of time has passed, the transportation motor will rotate in reverse direction.
4. The paper will be switchbacked [5] once, and the rear edge of the paper contacts the registration guide [6].
5. When the paper is switchbacked, the paper forms a loop [1] between the paper conveyance roller and the registration guide, and corrects the paper skew (tilt).
6. The paper feed sensor at the punch section detects the rear edge of the paper, and the paper conveyance motor stops after the specified period of time to stop the switchback of the paper.
7. The switchback of the paper stops, and the puncher [1] moves down to punch the hole on the paper
8. After punching the hole, the conveyor motor rotates forward to transport the paper into the finisher.

### 5.3.2 Punch control

- The holes are punched on the paper by switchback of the paper into the punch unit and by moving the puncher up/down by the punch motor.

| $[1]$ | Puncher slide pin | $[2]$ | Puncher |
| :--- | :--- | :--- | :--- |
| $[3]$ | Puncher frame | $[4]$ | Puncher home sensor (PS204) |
| $[5]$ | Puncher frame slide pin | $[6]$ | Puncher drive cam |
| $[7]$ | Puncher drive cam sensor (PS203) | $[8]$ | Encoder |
| $[9]$ | Punch motor sensor (PS202) | $[10]$ | Punch motor (M201) |
| $[11]$ | Slide cam | - | - |

## (1) Paper punching process

1. The puncher frame waits at the home position to make the puncher waits at the upper position.

Position of the puncher frame is detected by the puncher home sensor.
2. Paper feed sensor at the punch section detects the rear edge of the paper, and stops switchback of the paper after a specified period of time.
3. The punch motor rotates forward to rotate the puncher drive cam forward. The punch frame then will move towards the front side. When the puncher frame moves towards the front side, the slide cam moves the puncher down by its cam shape.
The rotation value of the punch motor is detected by the number of times light shielding plate blocks the punch encoder sensor. The value the slide cam moves back and forth differs depending on the value the punch motor rotates. When the value the slide cam moves changes, the value of the puncher moves in vertical direction also changes. The position of the puncher is judged in process. The rotating position of the puncher driven cam is detected by the puncher drive cam sensor.
Example: Figure for 2 holes punching operation for 2 hoes $/ 3$ holes kit

[1] Puncher
[2] Slide cam
[3] Puncher frame (home position)
[4] Puncher frame (Punching position)
4. When the puncher frame moves to the front side, the slide cam pushes the puncher down to punch the holes at the rear edge of the paper. (The holes are punched paper by paper.) The holes are judged to be punched according to the rotation value of the punch motor. NOTE

- The number of the punchers (number of the holes) differs depending on the type of the punch kit .
- The number of the punch holes is switched according to the shift value of the puncher frame for the 2 holes/3 holes kit as well as 2 holes/4 holes kit.
For details, see "PI.5.3.3 Punch holes switch control".

5. When the holes are punched, the punch motor rotates in reverse direction, and the puncher drive cam rotates in reverse direction. This process leads the puncher frame to return to the home position to move the puncher up.

### 5.3.3 Punch holes switch control

- 2 holes/3 holes punch kit as well as 2 holes/4 holes punch kit have mechanisms to switch the number of punch holes.

## (1) Number of punch holes switch mechanism

- The slide cam has a guide. With the shape of the guide and the difference shift value of the puncher frame, only the specified puncher can be moved down.
- The shift value of the puncher frame is judged by the rotation value of the punch motor. The rotation value of the punch motor is detected by the punch motor sensor.
- The number of the punch holes can be selected when selecting the punch mode.

## NOTE

- When the second type of punch hole (3 holes on the illustration) is selected, the puncher frame shifts to the waiting position 2 from the waiting position 1 (home position) and waits prior to the job.
- The number of the puncher and the guide shape of the slide cam differ depending on the type of the punch kit.

Example: cross section of the 2 holes/3 holes kit

| $[1]$ | Waiting position 1 (home position) | [2] | Puncher frame shift value: Small (Example: 2 holes <br> punching position) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Waiting position 2 (puncher frame shift value: medium) | $[4]$ | Puncher frame shift value: Large (Example: 3 holes <br> punching position) |
| $[5]$ | Puncher | $[6]$ | Slide cam |

(2) Puncher frame position detect mechanism

| $[1]$ | Puncher slide pin | $[2]$ | Puncher |
| :--- | :--- | :--- | :--- |
| $[3]$ | Slide cam | $[4]$ | Puncher frame |
| $[5]$ | Puncher home sensor (PS204) | $[6]$ | Puncher frame slide pin |
| $[7]$ | Puncher drive cam | $[8]$ | Puncher drive cam sensor (PS203) |
| $[9]$ | Encoder | $[10]$ | Punch motor sensor (PS202) |
| $[11]$ | Punch motor (M201) | - | - |

## (a) Puncher position detect control

- The waiting position 1 (home position) and the waiting position 2 are judged by the assembly of the detecting result of the punch home sensor and the puncher drive cam sensor

| Puncher retract position | Puncher home sensor | Puncher drive cam sensor |
| :---: | :--- | :--- |
| Waiting position 1 (puncher retract position) | Blocked | 1st light block |

| Puncher retract position | Puncher home sensor | Puncher drive cam sensor |  |  |
| :--- | :--- | :--- | :---: | :---: |
| Punching position 1 (Example: 2 holes <br> punching) | Unblocked | 1st light unblock |  |  |
| Waiting position 2 (puncher retract position) |  |  |  |  |
| Punching position 2 (Example: 3 holes <br> punching) |  | 2nd light block |  |  |

(b) Puncher shift value detect mechanism

- The shift value of the puncher frame is judged by the number of times the encoder blocks the punch motor sensor.

### 5.3.4 Punch dust full detection control

- The punch dust box section has the punch dust full sensor. When the job is commanded with the punch dust exceeding the specified value, a warning message for the punch dust full is displayed on the control panel.
- The punch dust full sensor detects the volume of the punch dust with the position of the agitating blade drive connecting lever.
- The punch dust full sensor also detects if the punch dust box is installed. If the punch dust box is not installed when the punch job is commanded, the warning message for the punch dust full will be displayed on the control panel.
- Even when the "punch dust full" is detected, printing is not prohibited. All the jobs except punch holes will be conducted until finished.

## Punch dust box over view

| $[1]$ | Punch dust box | $[2]$ | Punch dust agitating blade |
| :--- | :--- | :--- | :--- |
| $[3]$ | Drive transmission gear | $[4]$ | Punch dust full sensor (PS205) |
| $[5]$ | Agitating blade drive connecting lever | - | - |

| $[5]$ | Punch dust full sensor (PS205) | $[6]$ | Punch motor (M201) |

(1) Punch dust full detect operation

Punch dust agitating blade home position view

In normal operation

When the punch dust is full

1. The drive transmission gear [2] stops while the punch motor [1] is in halt. The punch dust agitating blade [3] in the punch dust box [6] waits at the home position.
The agitating blade drive connecting lever [4] blocks the punch dust full sensor [5] during that time.
2. When the punch motor rotates forward, the drive transmission gear rotates forward.
3. When the drive transmission gear rotates forward, the agitating blade drive connecting lever rotates forward to rotate the punch dust agitating blade forward.
When the agitating blade drive connecting lever rotates, the punch dust full sensor is unblocked.
The punch dust agitating blade rotates to level the punch dust in the punch dust box.
4. When punch holes is complete, the punch motor starts rotating in reverse direction.
When the punch motor rotates in reverse direction, the punch dust agitating blade rotates in reverse direction and tries to return to the home position.
5. NOTE

In normal operation:

- The agitating blade drive connecting lever [2] and the punch dust agitating blade [1] return to their home positions by the punch motor's drive force.
- By the agitating blade drive connecting lever [2] returning to the home position, the punch dust full sensor [3] will block the light. The punch dust [4] then is judged not to be full.

6. NOTE

When the punch dust is full:

- The agitating blade drive connecting lever [4] and the punch dust agitating blade [1] cannot return to their home positions due to the punch dust [3].
- The torque limiter function is installed to the drive transmission gear to prohibit transmission of the drive force more than specified.
- With the agitating blade drive connecting lever [4] not returning to the home position, the punch dust full sensor [2] keeps being unblocked. When the transmission status is detected for 10 consecutive times during punching operation, the punch dust [3] is detected to be full to display the message warning that the punch dust is at full level.
(a) Punch dust full message

Example of display

| Proyram auick Copy |
| :--- | :--- |
| Ready to Copy |
| Empty the hole-punch scrap box. |

Example of display
t Hole-Punch scrap box is full.
Empty the hole-punch scrap box.

## Details..

## NOTE

- The display details and message text are changed when the JS-506 is installed to the MFP.
(2) Punch dust box not installed detect control

1. When the punch dust box is installed, the agitating blade drive connecting lever waits at the home position. (blocks the punch dust full sensor)
2. When the punch dust box is removed, the punch dust full sensor is unblocked.
3. When the finisher is closed and the punch job is commanded with the above status, the punch dust box is detected as uninstalled. So that the message appears on the control panel to warn that the punch dust box is full.
NOTE

- Even when the "punch dust box not installed" is detected, printing is not prohibited. All other jobs except punching holes will be conducted and continued until finished.
- Punching the holes to the paper will be conducted only when the punch dust box is installed.
(3) Unit change function
- The screen to be displayed when a punch dust full is detected can be enabled or disabled in the "Unit Change" in the Service Mode. Service Mode/System screen: typical

System 2/Unit Change screen: typical

| Unit Change |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Toner Cartridge | User | Service | Waste Toner Box | User | Service |
| Imaging Unit | User | Service | Hole-punch | User | Service |
| Warning display |  |  |  |  |  |
| Toner Near Empty | Yes | No |  |  |  |
| Near EnptyDisplay Time ${ }^{\text {wirning Display }}$ \%ime |  |  |  |  |  |

## NOTE

- The Service Mode screen display, details, menus, and default settings are changed when the JS-506 is installed to the MFP.
- For details of the Service Mode, see "Unit Change."

## 6. TRANSPORT SECTION

### 6.1 Configuration

- At the transport section, paper that is transported from the MFP paper exit section (punch section when a punch kit is installed) is transported into the finisher and alignment section.

| $[1]$ | Jam removal dial | $[2]$ | Paper conveyance roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper feed sensor (PS101) | $[4]$ | Receiving roller |
| $[5]$ | Paper conveyance motor (M101) | $[6]$ | Paper exit roller/upper |
| $[7]$ | Paper exit roller/lower | $[8]$ | Paper exit roller solenoid (SD103) |
| $[9]$ | Exit roller lift up motor (M104) | $[10]$ | Paper exit motor (M102) |
| $[11]$ | Pick up roller position sensor (PS105) | - | - |

### 6.2 Drive

### 6.2.1 Drive outline

The driving source of the transport section is the paper conveyance motor, paper exit motor, and exit roller lift up motor, and the following parts are driven.

| Section | Driving source | Driving parts | Function |
| :---: | :---: | :---: | :---: |
| Transport/ receiving roller section | Paper conveyance motor | - Paper conveyance roller <br> - Receiving roller | - Transports the paper to inside the finisher <br> - Transports the paper to the alignment section <br> - Switchbacks the paper to the punching section (when in punch mode) |
| Paper exit roller section | Paper exit motor | - Paper exit roller/upper <br> - Paper exit roller/lower <br> - Paper exit paddle | - Rotates the paper exit roller/upper in reverse direction to transport the paper to the alignment tray (when in sort/group mode) <br> - Rotates the paper exit roller/upper and the paper exit roller/lower in forward direction to exit the paper to the paper exit tray |
|  | Exit roller lift up motor | - Paper exit roller/upper <br> - Paper guide | - Moves the paper exit roller/upper and the paper guide up/down <br> - Moves the paper exit roller/upper down to transport the paper to the alignment tray (when in sort/group mode) <br> - Moves the paper exit roller/upper down to exit the paper to the paper exit tray |

### 6.2.2 Paper conveyance/receiving roller section drive

- The drive source for the paper conveyance and the receiving roller section is the paper conveyance motor which drives paper conveyance roller and the receiving roller.
- The paper conveyance roller and the receiving roller can be manually rotated (forward/reverse) by manually rotate the jam removal dial. This dial is to be used when the paper is clogged inside the finisher.

| $[1]$ | Jam removal dial | $[2]$ | Paper conveyance roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper feed sensor (PS101) | $[4]$ | Paper conveyance motor (M101) |
| $[5]$ | Receiving roller | - | - |

### 6.2.3 Paper exit roller section drive

- The paper exit roller section has 2 types of drive mechanisms.

| $[1]$ | Pick up roller position sensor (PS105) | $[2]$ | Direction of the transport (transport section) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper lift up cam | $[4]$ | Paper exit roller/upper |
| $[5]$ | Paper exit roller/lower | $[6]$ | Direction of the paper exit (receive section) |
| $[7]$ | Paper guide | $[8]$ | Paper guide |
| $[9]$ | Paper exit roller solenoid (SD103) | $[10]$ | Exit roller lift up motor (M104) |
| $[11]$ | Paper exit motor (M102) | - | - |

## (1) Paper exit motor

- The paper exit motor drives the paper exit roller/upper and the paper exit roller/lower.
- The paper exit roller/upper is connected to the paper exit motor. Rotation of the paper exit motor rotates the paper exit roller/upper.
- The connection of the paper exit roller/lower and the paper exit motor is released while waiting. Turn on/off of the paper exit roller solenoid to connect the paper exit roller/lower drive gear and rotate (forward direction*) the paper exit roller/lower. NOTE
- *: A torque limiter is installed to the paper exit roller/lower. Therefore, when the reverse rotation force of over the predetermined value is applied from the paper exit roller/upper which is pressed at the time of FD alignment , the paper exit roller/lower rotates in reverse direction as the paper exit roller/upper rotates.

Paper exit motor drive view

| $[1]$ | Paper exit roller/upper | $[2]$ | Paper exit motor (M102) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper exit roller solenoid (SD103) | $[4]$ | Paper exit roller/lower |

Paper exit roller/lower drive front view

| $[1]$ | Paper exit roller/lower drive gear | $[2]$ | Paper exit roller/lower drive gear lock plate |
| :--- | :--- | :--- | :--- |
| $[3]$ | Rotation lock claw | $[4]$ | Paper exit roller solenoid (SD103) |

## (2) Exit roller lift up motor

- The exit roller lift up motor drives the up/down operation of the paper exit roller/upper. It also drives the paper guide (2 points) and the paper guide (2 points). The paper exit roller/upper waits at the upper position. Rotation of the exit roller lift up motor moves the paper exit roller/lower down. (Drive source for rotating the paper exit roller/upper is the paper exit motor.)
- The exit roller lift up motor rotates the cam (4 points). When the cam rotates, the paper guide pushed up by the cam will be unlocked to move the paper guide down by its own weight.

| $[1]$ | Cam | $[2]$ | Exit roller lift up motor (M104) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper guide | $[4]$ | Paper guide |
| $[5]$ | Paper exit roller/upper | - | - |

### 6.3 Operation

### 6.3.1 Paper conveyance/receiving roller section paper transport control

- The paper conveyance roller sends the paper that is transported from the MFP paper exit section (or from the punch section) to the receiving roller.
- The receiving roller sends the paper transported from the paper conveyance roller to the receiving section or the alignment section.
- The paper feed sensor detects the front edge and the rear edge of the paper. This will make the unit to detect the transportation and path of the paper.
- When in punch mode, the paper conveyance roller and the receiving roller rotate in reverse direction to switchback the paper and punch the holes at the punch section.
When the holes are punched, the paper conveyance roller and the receiving roller rotate in forward direction to send the paper to the receiving section or to the alignment section.
For details on punching operation, see "PI.5.3.2 Punch control".
[2]

[3]
[4]

| $[1]$ | Paper feed sensor (PS101) | $[2]$ | Receiving roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper conveyance roller | $[4]$ | Paper |

### 6.3.2 Paper exit roller section paper transport control

(1) Non sort mode, Non group mode, Non staple mode, Sort mode, Group mode

- The paper guide waits at the upper position by the cam. When the cam rotates by the exit roller lift up motor, the paper guide will be unlocked and moves down to the lower position. The paper sent from the transport section will be led to the exit roller by the paper guide.
- The paper exit roller/upper moves down to hold the paper from the transport section with the paper exit roller/lower to discharge it to the exit tray.
- The paper surface detect sensor/1 detects that the paper is discharged to the paper exit tray by the actuator being pushed down while the paper passes through and then returned to the original position.

| $[1]$ | Paper | $[2]$ | Paper guide |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper exit roller/upper | $[4]$ | Paper exit roller/lower |
| $[5]$ | Paper surface detect sensor/1 (PS102) | $[6]$ | Paper surface detect sensor/1 actuator |
| $[7]$ | Batch weight guide | $[8]$ | Alignment roller |

(2) Sort offset function mode, Group offset function mode, Staple mode

1. The paper exit roller/upper stops rotating at the upper position and waits.

The paper exit roller/lower waits at the halt status.
2. The first paper is discharged [2] by the receiving roller [1], and moves down to the alignment tray by its own weight. [3]

## NOTE

- The paper surface detect sensor/1 [4] detects that the paper is discharged to the alignment tray when the actuator [5] is pressed down by the paper.

3. The paper exit roller/upper [1] moves down to hold the first paper on the alignment tray [2] with the paper exit roller/lower [3] to rotate rollers* in reverse direction and transport the paper to the alignment roller [5].
[2]
[1]

## NOTE

## - *: The paper exit roller/lower [3] rotates in reverse direction driven by the paper exit roller/upper [1].

4. The paper exit roller/upper [1] moves up and stops rotating.
5. The alignment roller [5] contacts the rear edge of the paper to the alignment plate [6] to align the paper. (paper FD alignment)
6. The alignment plate moves back and forth to align right and left of the paper. (paper CD alignment)
7. The batch weight guide [4] moves down to hold the rear end [2] of the aligned paper.

For drive of the batch weight guide, see " PI.7.2.2 (3) Batch solenoid".

## NOTE

- The batch weight guide [4] prevent the second paper and after to misalign the aligned paper [2]. For details, see " PI.7.3.2 Paper alignment control (paper FD alignment)".

8. The second paper will be discharged over the first paper on the alignment tray.
9. The batch weight guide [4] moves up to release the rear end of the paper.
10. The paper exit roller/upper [1] moves down to hold the first and the second paper on the alignment tray with the paper exit roller/lower to rotate the paper exit roller/upper [1] in reverse direction, and transport it to the alignment roller [5] to align the rear edge of the paper.
11. The alignment plate moves back and forth to align the paper.

NOTE

- The second paper and after will be transported in the same way.
" For details of the paper alignment control, see " PI.7.3.1 Paper alignment overview".

12. When the last paper is aligned, the paper exit roller/upper [2] will move down to hold all the paper on the alignment tray [3] with the paper exit roller/lower [4].
[3]
[2]

NOTE

- When in staple mode, stapling is conducted after paper alignment is finished. For details on stapling control, see " PI.8.2.2 Stapling control".
- For control after the paper is discharged to the paper exit tray, refer to the receiving section .

13. The batch weight guide [5] moves up to release the rear edge of the paper [2].
14. The paper exit roller/upper [2], paper exit roller/lower [4], and the alignment roller [1] rotate to discharge the paper [3] to the paper exit tray. (The paper exit roller/upper [2] and paper exit roller/lower [4] rotate in forward direction, and the alignment roller [1] rotates in reverse direction.)

### 6.3.3 Paper exit roller up/down control

The paper exit roller moves up/down when transporting the paper from the paper conveyance or receiving roller section to the receiving section or to the alignment section.

| $[1]$ | Exit roller lift up gear | $[2]$ | Pick up roller position sensor (PS105) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Exit roller lift up motor (M104) | $[4]$ | Paper exit roller/upper |

(1) Lift up control in non-sort mode, non-group mode, non-staple mode, sort mode, and group mode

1. The paper exit roller/upper is moved down from the upper position (home position) to the lower position (press position) to hold the paper with the paper exit roller/upper and the paper exit roller/lower to rotate the roller forward and to discharge the paper to the paper exit tray.
2. The paper exit roller/upper moves up when the paper transportation is complete. (returns to the home position)
(2) Lift up control in sort offset mode, group offset mode, and staple mode
3. The paper exit roller/upper waits at the upper position (home position) and discharges the paper to the alignment tray.
4. The paper exit roller/upper moves down from the upper position to the lower position (press position).
5. The paper exit roller/upper rotates in reverse direction and sends the paper to the alignment section.

NOTE

- When transporting the paper to the alignment section, only the paper exit roller/upper rotates in reverse direction.

4. The paper is aligned in the alignment section. When the paper is being aligned, the paper exit roller/upper waits at the upper position.
5. When aligning and stapling are finished, the paper exit roller/upper moves down to hold the paper with the paper exit roller/upper and the paper exit roller/lower, and rotates the roller in forward direction to discharge the paper to the paper exit tray.
6. The paper exit roller/upper moves up when the paper transportation is complete. (returns to the home position)
(3) Paper exit roller position detect control

7. The paper exit roller/upper waits at the upper position [7]. (home position) The light shield plate [2] of the gear [8] installed on the lift up shaft for the paper exit roller/upper blocks the pick up roller position sensor [1] and detects that the paper exit roller/upper is at the home position [7].
8. When the exit roller lift up motor rotates, the gear on the exit roller lift up shaft rotates [3] to move the paper exit roller/upper [4] down to be pressed [6] to the paper exit roller/lower [5]. (Paper exit roller/upper at press position) When the gear [3] rotates, the light shield plate [2] also rotates to unblock the pick up roller position sensor [1]. This process detects that the paper exit roller/upper [4] position is at the press position.

| Paper exit roller/upper position | Pick up roller position sensor |
| :--- | :---: |
| Upper position (home position) | Blocked |
| Lower position (pressure position) | Unblocked |

### 6.3.4 Paper exit roller/lower drive connecting control

- It rotates the paper exit roller/lower when transporting the paper from the transport section to the receiving section or to the alignment section.
- The connection of the paper exit roller/lower and the paper exit motor is released by the paper exit roller solenoid when waiting. On/off of the paper exit roller solenoid connects the paper exit roller/lower to the paper exit motor, and rotates as the paper exit motor rotates. When the paper exit roller/lower and the paper paddle rotate one revolution clockwise (forward direction), the connection with the paper exit motor will be released and stop.
NOTE
- For details of the paper weight paddle control, see " PI.9.3.1 Paper exit paddle control".

| $[1]$ | Paper exit motor (M102) | $[2]$ | Paper exit roller/lower drive gear |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper exit roller/lower | $[4]$ | Paper exit roller solenoid (SD103) |

(1) Paper exit roller/lower drive connecting process

1. Connection of the paper exit roller/lower with the paper exit motor is released while waiting. On/off of the paper exit roller solenoid [4] operates the rotation lock claw [3] for the paper exit roller solenoid to release the lock plate [2] installed on the paper exit roller/lower drive gear [1].
2. By the paper exit roller/lower drive gear [3] being rotated by the spring force [2], it will be connected to the drive mechanism [4] of the paper exit motor [1]. This process transfers drive force to the paper exit roller/lower drive gear to rotate the paper exit roller/lower
3. The paper exit roller/lower will be released from the paper exit motor [1] drive mechanism by the shape of the paper exit roller/lower drive gear [4] after rotating about one revolution. (Connection between the paper exit roller/ lower and the paper exit motor [1] will be released.)
4. The paper exit roller/lower drive gear [4] will be locked to prohibit rotation by the rotation lock claw [2] of the paper exit roller solenoid [3]. (The paper exit roller/lower stops rotating.)

## 7. ALIGNMENT SECTION

### 7.1 Configuration

- In the alignment section, paper transported from the transport section is aligned and delivered to the paper exit tray.

| $[1]$ | Alignment roller motor (M103) | $[2]$ | Alignment roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Drive connecting belt | $[4]$ | Batch weight guide |
| $[5]$ | Receiving roller | $[6]$ | Paper conveyance motor (M101) |
| $[7]$ | Batch solenoid (SD102) | $[8]$ | Alignment plate home sensor/R (PS109) |
| $[9]$ | Paper exit roller/lower | $[10]$ | Alignment motor/R (M106) |
| $[11]$ | Paper surface detect sensor/1 (PS102) | $[12]$ | Alignment motor/F (M105) |
| $[13]$ | Paper exit roller solenoid (SD103) | $[14]$ | Alignment plate home sensor/F (PS108) |
| $[15]$ | Alignment plate/Fr | - | - |

### 7.2 Drive

### 7.2.1 Drive outline

The driving source of the alignment section is the paper conveyance motor, alignment roller motor, batch solenoid, alignment motor, and paper exit motor, and the following parts are driven.

| Section | Driving source | Driving parts | Function |
| :---: | :---: | :---: | :---: |
| Alignment roller section | Paper conveyance motor | Receiving roller | Transports paper to the alignment tray. |
|  | Alignment roller motor | Alignment roller | - Switchbacks the paper to align the rear edge of the paper. (FD alignment operation) <br> - The aligned paper will be discharged to the paper exit tray. |
|  | Batch solenoid | Batch lever | It holds the rear edge of the paper on the alignment tray. It prevents the aligned paper to be misaligned by the paper that follows. |
| Alignment tray section | Alignment motor | Alignment plate/Fr | It moves the alignment plate/Fr forward and backward to align the paper. (CD alignment operation) |
|  |  | Alignment plate/Rr | It moves the alignment/Rr forward and backward to align the paper. (CD alignment operation) |
|  | Paper exit motor | Paper exit roller/upper | - It transports the paper to the alignment tray. (switchback) <br> - Exits paper to the paper exit tray. |
|  |  | Paper exit roller/lower | The paper is discharged to the paper exit tray. |
|  |  | Paper exit paddle |  |

### 7.2.2 Alignment roller section

There are 3 types of drive mechanisms for the alignment roller section.

| $[1]$ | Direction of the paper exit (receive section) | $[2]$ | Receiving roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Alignment roller motor (M103) | $[4]$ | Alignment roller |
| $[5]$ | Paper weight guide | $[6]$ | Direction of the paper transport (transport section) |
| $[7]$ | Batch solenoid (SD102) | $[8]$ | Paper conveyance motor (M101) |

## (1) Paper conveyance motor

- The receiving roller is driven by the paper conveyance motor.
- For details of the receiving roller drive, see "Paper conveyance/receiving roller section drive".
- The receiving roller is installed on the drive shaft for the receiving roller. It rotates by the drive force of the transport motor.

NOTE

- The drive transmission pulley is not fixed to the receiving roller's drive shaft. Therefore, the alignment roller does not rotate even when the paper conveyance motor rotates.

## (2) Alignment roller motor

- The alignment roller is driven by the alignment roller motor.
- The alignment roller rotates by the drive force of the alignment roller motor through the drive transmission pulley on the drive shaft for the receiving roller.
NOTE
- The drive transmission pulley is not fixed to the receiving roller's drive shaft. Therefore, the receiving roller does not rotate even when the alignment roller motor rotates.

(a) Enlarged view of the alignment roller drive section

(b) Alignment roller drive section front view

| $[1]$ | Alignment roller | $[2]$ | Drive connecting belt |
| :--- | :--- | :--- | :--- |
| $[3]$ | Drive connecting pulley | $[4]$ | Receiving roller |
| $[5]$ | Drive connecting gear | - | - |

## (3) Batch solenoid

- The batch lever is driven by the batch solenoid.
- The batch lever and the batch guide wait at the upper position by the spring force. (home positions)
- When the batch solenoid turns on, the drive shaft for the batch lever rotates to rotate the batch lever downward
- The batch guide is pressed down by the batch lever moving downward.
- When the batch solenoid turns off, the drive shaft for the batch lever rotates by the spring force to return the batch lever and the batch guide to the upper position.

| $[1]$ | Batch solenoid (SD102) | $[2]$ | Batch guide |
| :--- | :--- | :--- | :--- |
| $[3]$ | Batch lever | - | - |

(a) Batch guide drive section front view

| $[1]$ | Batch lever | $[2]$ | Batch guide |
| :--- | :--- | :--- | :--- |
| $[3]$ | Batch solenoid (SD102) | - | - |

### 7.2.3 Alignment tray section

- The alignment tray section has 2 types of drive mechanisms.

## (1) Alignment motor

- The alignment motor drives the alignment plate back and forth.
- The alignment plate/Fr, and the alignment plate/Rr have individual alignment motors. This enables each alignment plate to independently move back and forth.

| $[1]$ | Alignment plate/Fr | $[2]$ | Paper stopper |
| :--- | :--- | :--- | :--- |
| $[3]$ | Alignment plate/Rr | $[4]$ | Alignment plate home sensor/R (PS109) |
| $[5]$ | Paper exit roller/lower | $[6]$ | Alignment motor/R (M106) |
| $[7]$ | Paper surface detect sensor/1 actuator | $[8]$ | Paper surface detect sensor/1 (PS102) |
| $[9]$ | Alignment motor/F (M105) | $[10]$ | Paper exit roller solenoid (SD103) |
| $[11]$ | Alignment plate home sensor/F (PS108) | - | - |

## (2) Paper exit motor

- The paper exit roller/lower is driven by the paper exit motor. For details of the paper exit roller/lower, see "Paper conveyance/receiving roller section drive" and "Paper exit roller/lower drive connecting process".

### 7.3 Operation

### 7.3.1 Paper alignment overview

- At the alignment section, the paper is aligned for the jobs in sort offset mode, group offset mode, and staple mode.
- The paper is discharged to the exit tray without being in alignment for non-sort mode, non-group mode, non-staple mode, sort mode, and group mode.
- When the paper is aligned, it is switchbacked to the alignment section individually. When alignment is finished, the paper or the batch is discharged to the paper exit tray.
- There are two types for paper alignment as described below.
- Paper FD Alignment: The operation to align rear edge of the paper in transportation direction.
- Paper CD Alignment: The operation to align both sides of the paper in the width direction.

### 7.3.2 Paper alignment control (paper FD alignment)

- The operation to align rear edge of the paper in transportation direction is called "paper FD alignment".
- The paper from the transport section will be transported to the alignment tray by the alignment roller. The rear edge of the paper then is aligned by contacting the rear edge of the paper to the paper stopper.
- The batch guide moves down to hold the rear edge of the aligned paper

## NOTE

- It prevents the aligned paper from being jumbled from when the $2 n d$ sheet of paper is discharged in the alignment tray.
- The batch guide moves up when the next sheet of paper is transported to the alignment tray, as well as when the paper is discharged from the alignment tray to release the paper

[5]

| $[1]$ | Alignment roller | $[2]$ | Batch guide |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper exit roller/upper | $[4]$ | Paper |
| $[5]$ | Paper stopper | - | - |

### 7.3.3 Paper alignment control (paper CD alignment)

- The operation to align both sides of the paper in the width direction is called "paper CD alignment".
- The paper from the transport section is transported to the alignment tray by the alignment roller. The paper is aligned by contacting the alignment plate/Fr and Rr to both sides (forward-backward direction) of the paper.
- The home position of the alignment plate is detected by the alignment plate home sensor. (alignment plate home sensor/F, R)

| $[1]$ | Alignment plate/Fr | $[2]$ | Paper stopper |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper | $[4]$ | Alignment plate $/ \mathrm{Rr}$ |

| $[5]$ | Alignment plate home sensor/R (PS109) | $[6]$ | Slide gear/Rr |
| :--- | :--- | :--- | :--- |
| $[7]$ | Alignment motor/R (M106) | $[8]$ | Slide gear/Fr |
| $[9]$ | Alignment motor/F (M105) | $[10]$ | Alignment plate home sensor/F (PS108) |

(1) Alignment plate control when in staple mode

- When the staple mode is commended, the alignment plate/Fr and the alignment plate/Rr shift according to the paper width. The paper is aligned by the alignment plates contacting from both front and rear sides.
- The above alignment operation will be conducted for the paper for every job to align the edges of the paper batch. When the alignment is finished, stapling process will be conducted.

## NOTE

- When printed in staple mode, paper batch will be stapled and be discharged to the paper exit tray without being shifted.
[2]

| $[1]$ | Paper | [2] | Alignment plate/Rr (shifting to the front side) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Alignment plate/Fr (shifting to the rear side) | - | - |

## (2) Alignment plate control for sort offset mode and group offset mode

- When commanding offset in sort mode or group mode, the alignment plate/Fr or the alignment plate/Rr presses the paper from one side to the far side (or front side) depending on the paper width. This process shifts the paper position.
- The paper batches will be sorted out by repeating the process above.

## NOTE

- The offset value (shift value) of the paper is 30 mm .
" When "Offset" is not commanded in the sort mode or the group mode, only the sort print/group print will be conducted, and the paper will be discharged to the paper exit tray without being shifted.

| $[1]$ | Alignment plate/Rr | [2] | Paper |
| :--- | :--- | :--- | :--- |
| $[3]$ | Alignment plate/Fr | - | - |

(a) Operation when shifting the paper to the front side

1. The alignment plate/Fr [3] will shift to the reference position at the front side. (The reference position differs depending on the paper size.)
2. The alignment plate/Rr [2] shifts according to the paper width. The paper [1] is pressed by the alignment plate/Rr [2] to be shifted to the front side.

(b) Operation when shifting the paper to the rear side
3. The alignment plate/Rr [2] will shift to the reference position at the rear side. (The reference position differs depending on the paper size.)
4. The alignment plate/Fr [3] shifts according to the paper width. The paper [1] is pressed by the alignment plate/Fr [3] to be shifted to the rear side.

## (c) Paper receiving quantity

- When the quantity of the paper that is received into the alignment tray in sort offset mode or in group offset mode reaches the specified value, the paper batch in the alignment tray will be discharged to the paper exit tray.
NOTE
Sample process for sort out:

1. When the job requires making of two sets with 10 sheets $A 4$ size document in sort offset mode, the paper batch is discharged when the sheet quantity reached 5 for the first copy.
2. The remaining 5 sheets will be aligned to be discharged with the same shift position. This will make 10 aligned and discharged sheets on the paper exit tray.
3. Then the shift position will be changed from the 1st copy to sort out the 2nd copy.
4. The process for the second copy leaves 2 sets with 10 sheets each on the exit tray.

Maximum batch discharge quantity for sort out

| Paper size | Paper type |  |
| :---: | :---: | :---: |
|  | - Thin paper ( $52 \mathrm{~g} / \mathrm{m} 2$ to $59 \mathrm{~g} / \mathrm{m} 2$ ) <br> - Plan paper ( $60 \mathrm{~g} / \mathrm{m} 2$ to $90 \mathrm{~g} / \mathrm{m} 2$ ) <br> - Recycled paper ( $52 \mathrm{~g} / \mathrm{m} 2$ to $90 \mathrm{~g} / \mathrm{m} 2$ ) | Thick paper (91 g/m2 to $300 \mathrm{~g} / \mathrm{m} 2)$ |
| 216 mm or less | 5 sheets | 3 sheets |
| More than 216 mm | 4 sheets |  |

- When the "Paper load quantity" or "Paper load height" of the paper in the exit tray reaches to the specified value during sort offset mode or group offset mode, the exit tray is judged to be full.
Amount of paper stacking

## NOTE

- The paper load height is detected by the paper level detection function. For details, see "PI.9.3.3 Paper level detect control".

### 7.3.4 Alignment tray paper detect control

- The alignment tray has paper surface detect sensor/1, which detects the paper path and the paper receiving in the alignment tray.
- Paper surface detect sensor/1, detects that the paper is transported to the alignment tray by the actuator being pressed down by the paper which passes it.

| $[1]$ | Receiving roller | $[2]$ | Paper exit roller/upper |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper exit roller/lower | $[4]$ | Paper surface detect sensor/1 actuator |
| $[5]$ | Paper surface detect sensor/1 (PS102) | $[6]$ | Alignment roller |

| [1] | Paper surface detect sensor/1 actuator: The paper is <br> stored (blocked) | [2] | Paper surface detect sensor/1 actuator: Paper is not <br> stored (unblocked) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper surface detect sensor/1 (PS102) | - | - |

(1) When in non-sort mode, non-group mode, non-staple mode, sort mode, and group mode

- The paper surface detect sensor/1 detects that the paper is transported to the paper exit roller /lower by the actuator being pressed down by the paper which passes it.
- When the paper alignment is finished, the sensor detects that the paper is discharged to the exit tray by the actuator returned to the original position with the paper discharged from the alignment tray.
(2) When in sort offset mode, group offset mode, and staple mode
- The paper surface detect sensor/1 detects that the paper is stored to the alignment tray by the actuator being pressed down by the switchbacked paper.
- When the alignment is finished, the sensor detects that the paper is discharged to the exit tray by the actuator returned to the original position.

## 8. STAPLER SECTION

### 8.1 Configuration/Drive

- The stapler waits at the home position at the front side.
- The stapler movement motor moves the stapler.
- When the stapler movement motor installed on the stapler mounting table rotates, the drive connecting gear rotates.

When the drive connecting gear rotates, the stapler mounting plate and the stapler, shifts back and forth along the slide gear.

| $[1]$ | Stapler | $[2]$ | Stapler movement motor (M107) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Slide gear | $[4]$ | Stapler home sensor (PS110) |

### 8.1.1 Stapler drive section top view

| $[1]$ | Stapler unit | $[2]$ | Stapler drive connecting gear |
| :--- | :--- | :--- | :--- |
| $[3]$ | Stapler movement motor (M107) | $[4]$ | Slide gear |
| $[5]$ | Stapler home sensor (PS110) | - |  |

### 8.2 Operation

### 8.2.1 Stapler positioning control

- The home position of the stapler is detected by the stapler home sensor.
- When in corner staple mode, the stapler waits at the home position and staples when the paper alignment is finished.
- When in 2 points staple mode, the stapler shifts to the first stapling position to conduct stapling. Then the stapler shifts to the second stapling position to conduct stapling. When the stapling is finished, the stapler returns to the home position.
- The stapling position is controlled based on the number of pulses generated by the stapler movement motor. No position sensors are provided for the corner staple and two-point staple functions.

### 8.2.2 Stapling control

## (1) Stapling operation

- The Stapling operation is driven by the stapler motor.
- In the stapling operation, the clincher staple arm is lowered by the stapler motor. The clincher staple arm presses the sheets. (This is called clamp operation.) Then a staple is pushed up by the staple arm from the stapler side. The staple is pressed through the sheets and bent from the clincher staple arm side, so that the sheets are fastened together.
- The stapler motor then lifts the clincher staple arm and lowers the staple arm to complete the stapling operation.
- The number of sheets that user wishes to staple are placed into the alignment tray and the stapling operation is performed. However, if the number exceeds the upper limit, the set of sheets is delivered to the exit tray without being stapled.
Maximum stapling quantity

| Paper size | Maximum stapling quantity |
| :--- | :--- |
| A4S or less (small size) | 50 sheets * |

| Paper size | Maximum stapling quantity |
| :--- | :--- |
| Foolscap or more (large size) | 30 sheets |

- *: When there are small size sheets and large size sheets with same width at the same time, they are judged as large size sheets, and the maximum staple quantity becomes 30 .
Example: When there are A4 LEF and A3 SEF, the maximum stapling quantity is 30 .
Overall view

| $[1]$ | Clincher staple arm | $[2]$ | Staple cartridge |
| :--- | :--- | :--- | :--- |
| $[3]$ | Stapler motor | - | - |

Front view

| $[1]$ | Staple cartridge | $[2]$ | Clincher staple arm |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper bunch | $[4]$ | Staple sheet (staple) |
| $[5]$ | Stapler | $[6]$ | Stapler motor (M14) |

### 8.2.3 Staple empty detection control

## (1) Staple cartridge

- The stapler is provided with a staple cartridge used only for the stapler.
- To reload the stapler with staples, the staple cartridge is first loaded with staples (staple sheet type: 5000 staples) and then the cartridge is attached to the stapler.
For information on how to load staplers, refer to the user's guide.

| $[1]$ | Staple cartridge | $[2]$ | Clincher staple arm |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper bunch | $[4]$ | Staple sheet (staple) |
| $[5]$ | Stapler | $[6]$ | Stapler motor |

## (2) Staple empty detection mechanism

- The stapler includes the self-priming sensor and staple empty sensor to detect the status of the staple cartridge and staples.
- The staple cartridge is loaded with staple sheets, and a staple sheet is conveyed to the clinch position (staple position) from the lowest one.
State where staple sheets are loaded

[1] Staple cartridge (loaded with staple sheets)
[2] Staple sheet fed from the cartridge
[3] Self-priming sensor (blocked)
[4] Staple empty sensor (unblocked)
- While the staple cartridge is loaded, if the trailing edge of the last staple sheet in the cartridge passes the actuator of the staple empty sensor, the actuator is raised by the spring force.
- When the actuator is raised, the staple empty sensor is blocked and machine determines that the cartridge is empty. The control panel displays to warn of the staple empty message.
State where the last staple sheet is fed

[1] Staple cartridge (staple empty)
[2] Staple sheet (remainder)
[3] Self-priming sensor (blocked)
[4] Staple empty sensor (blocked)

State where staple sheet runs out

[1] Staple cartridge (empty)
[2] Self-priming sensor (unblocked)
[3] Staple empty sensor (blocked)

- Even when the staple empty sensor detects the trailing edge of the last staple sheet, the staple sheet (staples: about 20) fed from the cartridge remains at the cartridge's front section. In this case, the actuator of the self prime sensor is pressed down by the leading edge of the staple sheet.
- If the actuator is pressed down, the self prime sensor is blocked and machine determines that the staple sheet is fed to the clinch position (staple position).
- Even when staple empty is detected, printing is not disabled. Paper is delivered without being stapled.
- After staple empty is detected, when the staple cartridge is loaded with staple sheets and the stapler is loaded with the cartridge, the actuator of the staple empty sensor is pressed down by the staple sheets.
- When the actuator is pressed down, the staple empty sensor is unblocked and staple empty condition is cleared. At this point, the staple empty sensor detects the staple sheets (unblocked). However, if the leading edge of the staple sheet cannot be detected by the selfpriming sensor (unblocked), the clinch operation is repeated up to 20 times to feed the leading edge of the staple sheet to the position (clinch position) where it can be detected by the self-priming sensor.
State where staple sheet runs out

[1] Staple cartridge (loaded with staple sheets)
[2] Staple sheet is fed by clinch operation
[3] Self-priming sensor (unblocked)
[4] Staple empty sensor (unblocked)
- If the self prime sensor cannot detect the leading edge of the staple sheet after clinch operations, machine determines that the staple sheet is not properly fed (staple sheet is not properly set) and the control panel displays to warn of the staple empty message.
- If the staple empty message appears even after staple sheets are loaded, check whether the staple sheets is properly set in the staple cartridge. If the cartridge is clogged with a staple sheet, clear the sheet.
- If staple empty occurs, the stapler stays at the stapler home position. (Position where staples can be supplied only by opening the front door)
(a) When the staple cartridge is not loaded

| $[1]$ | Staple cartridge (not mounted) | $[2]$ | Self-priming sensor (unblocked) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Staple empty sensor (blocked) | - | - |

- The actuator of the staple empty sensor is raised by the spring force. The staple empty sensor is blocked.
- If the staple empty message appears even after staple sheets are loaded, check whether the staple sheets is properly set in the staple cartridge. If the cartridge is clogged with a staple sheet, clear the sheet.
- The control panel displays to warn of the staple empty message

### 8.2.4 Clogged staple detection control

- Stapling operation is performed by lowering of the clincher staple arm and lifting of the staple arm.
- The staple arm position is detected by the stapler home sensor located in the stapler.
- The stapler determines that the stapling operation is completed if the staple arm returns to the home position within the specified time after the stapling operation. If the staple arm does not return to the home position after the specified time has passed, the machine determines that staple trouble has occurred and trouble code C1109 appears on the control panel.

## 9. RECEIVING SECTION

### 9.1 Configuration

- In the receiving section, paper transported into the finisher is placed into paper exit tray. The tray up/down mechanism moves the tray down depending on the amount of discharged paper, so that a maximum of 500 sheets can be stored. The tray also includes the mechanism for detecting the number of stacked sheets.

| $[1]$ | Tray lift up motor (M109) | $[2]$ | Shaft |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper exit roller/lower | $[4]$ | Paper exit tray |
| $[5]$ | Paper exit tray home sensor (PS107) | $[6]$ | Paper exit roller solenoid (SD103) |
| $[7]$ | Paper surface detect sensor/2 (PS104) | $[8]$ | Paper weight lever sensor (PS103) |
| $[9]$ | Paper surface detect lever | $[10]$ | Paper surface detect solenoid (SD101) |

### 9.2 Drive

### 9.2.1 Drive outline

- The driving source of the receiving section is the tray lift up motor, paper surface detect solenoid, and paper exit motor. The following parts are driven.

| Section | Driving source | Driving parts | Function |
| :---: | :---: | :---: | :---: |
| Tray lift up section | Tray lift up motor | Paper exit tray | The paper exit tray will be moved up/down according to the discharged paper load. |
| Paper level detect section | Paper surface detect solenoid | Paper surface detect lever | - The paper surface level detect lever is moved up/down to detect the paper load discharged to the paper exit tray. <br> - For consecutive printing, the rear edge of the paper discharged to the paper exit tray will be held by the paper surface level detect lever. It prevents the discharged paper from being misaligned by the paper that follows. |
| Paper exit roller section | Paper exit motor | Paper exit roller/lower | The paper is discharged to the paper exit tray. |
|  |  | Paper exit paddle | It rotates so that the rear edge of the paper which passed through the paper exit roller/lower will be held to be discharged to the paper exit tray/upper without fail. |

### 9.2.2 Tray lift up section

- The drive source is the tray lift up motor which moves the exit tray up/down.

| $[1]$ | Paper exit tray home sensor (PS107) | $[2]$ |
| :--- | :--- | :--- |
| $[3]$ | Tray lift up motor (M109) | $[4]$ |
| Tray lifter |  |  |

### 9.2.3 Paper level detect section

- The paper surface detect solenoid drives the paper surface level detect lever.
- The paper surface detect solenoid turns on to rotate the paper surface level detect lever downward.
- The paper surface detect solenoid turns off to allow the paper surface level detect lever to return to the upward position via spring force.

## [2]

[4]

| $[1]$ | Paper surface detect sensor/2 (PS104) | $[2]$ | Paper weight lever sensor (PS103) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper surface detect lever | $[4]$ | Paper surface detect solenoid (SD101) |

| $[1]$ | Paper surface detect sensor | [2] | Paper surface detect lever (upper position: when solenoid <br> is turned OFF) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper surface detect lever (lower position: when solenoid <br> is turned ON) | - | - |

### 9.2.4 Paper exit roller section

- The paper exit motor drives the paper exit roller/lower. For details of the paper exit roller/lower, see "Paper conveyance/receiving roller section drive" and "Paper exit roller/lower drive connecting process".
- The paper exit paddle (4 points) on the drive shaft at the paper exit roller/lower, also rotates with the paper exit roller/lower.

## (1) Overall view

| $[1]$ | Paper exit paddle | $[2]$ | Paper exit roller solenoid (SD103) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper exit motor (M102) | $[4]$ | Paper exit roller/lower drive gear |
| $[5]$ | Paper exit roller/lower | - | - |

(2) Paper press down paddle front view

[1] Paper paddle (home position)
[2] Paper on the paper exit tray

### 9.3 Operation

### 9.3.1 Paper exit paddle control

- There are paper exit paddles (4 points) installed on the paper exit roller/lower shaft. It rotates so that the paper exit paddle holds the rear edge of the paper when the paper passes through the paper exit roller/lower, and to discharge the paper to the paper exit tray without fail.

## (1) Paper discharge process

1. When the last paper is aligned, the paper exit roller/upper moves down to hold all the paper on the alignment tray with the paper exit roller/lower and to discharge the paper to the paper exit tray with paper exit roller/upper, paper exit roller/lower and the alignment roller.
[3]
[2]
[1]

[1] Alignment roller
[2] Paper exit roller/upper
[3] Paper
[4] Paper exit roller/lower
[5] Paper exit paddle
2. The paper exit paddle pushes out the rear edge of the paper which passed through the paper exit roller/lower to press the paper over the paper exit tray.

## NOTE

- The paper exit paddle is installed on the paper exit roller/lower shaft. It rotates one revolution and stops as the exit roller/ lower does.
For details of the paper exit roller/lower operation mechanism, see " Pl.6.3.4 (1) Paper exit roller/lower drive connecting process".

3. The paper exit paddle presses the paper and returns to the home position.

[1] Paper exit paddle (home position)
[2] Paper on the paper exit tray
NOTE

- The paper exit paddle is made from soft rubber. It curves after discharging the paper to the paper exit tray to return to the home position inside the machine.

4. After the paper exit paddle is retracted, the paper surface detect lever rotates to press the rear edge of the discharged paper. For details of the paper surface detect lever operation mechanism, see "PI.9.3.3 Paper level detect control".

### 9.3.2 Paper exit tray lift up control

- The up/down motion of the paper exit tray is conducted by the tray lift up motor.
- When the tray lift up motor rotates forward, the tray drive belt rotates forward through the gear to lift up the paper exit tray.
- When the tray lift up motor rotates in a reverse direction, the tray drive belt rotates in a reverse direction through the gear to lower the paper exit tray.
- The paper exit tray home sensor detects the home position of the paper exit tray.
- The height of the paper exit tray is detected by the paper level detect mechanism. When a job is commanded, the paper surface detect lever operates to move the paper exit tray up/down according to the detected result. For details of the control, see "PI.9.3.3 Paper level detect control".

| $[1]$ | Paper exit tray home sensor (PS107) | $[2]$ | Shaft |
| :--- | :--- | :--- | :--- |
| $[3]$ | Tray lift up motor (M109) | $[4]$ | Tray lifter |

### 9.3.3 Paper level detect control

- The paper level is detected by the paper weight lever sensor and paper surface detect sensor/2. The height of the paper exit tray is controlled according to the detected result.
- The paper surface detect actuator rotates when the paper surface detect solenoid turns on, to hold the rear top face of the paper on the paper exit tray. The rotation value of the paper surface detect lever changes at this point, according to the paper load and the height of the paper exit tray.
- The paper weight lever sensor and paper surface detect sensor/2 are installed at different heights. (Paper weight lever sensor: high, paper surface detect sensor/2: low) The paper surface detect lever has two light shield plates with different lengths, which provides different detection result for each sensor with the rotation value found by the paper surface detect lever. The current paper level is judged according to the result so that the paper exit tray will be controlled to move up/down to the suitable height.
- The paper level is detected every time the paper is discharged to monitor the paper height. For consecutive printing, it also prevents discharged paper from being misaligned by the following paper being discharged.
- When the paper exit tray home sensor detects the exit tray while the paper exit tray is moving down, the paper exit tray is judged to be full and the warning message will be displayed on the control panel, informing that the paper exit tray is full.
- The paper surface detect lever moves down when the paper is removed from the paper exit tray. When the lever moves down, the paper is detected to be removed, and the paper exit tray full display will be released.
Paper level detect table

| Paper <br> surface <br> detect <br> sensor/2 | Paper weight <br> lever sensor | Paper level |  |
| :---: | :---: | :--- | :--- |
| Unblocked | Blocked | High | - The paper exit tray lift up control <br> will be rotated in reverse direction and move the paper exit tray down to the reference position. <br> When the paper exit tray home sensor detects the paper exit tray while the paper exit tray is <br> moving down, the exit tray is judged to be full, and the following printing job will be prohibited. |
| Blocked | Blocked |  | Ther |
| Blocked | Unblocked | Reference <br> position | Reference position. The paper exit tray will not move up/down. |
| Unblocked | Unblocked | Low | The paper exit tray is at the lower position than the reference position. The tray lift up motor will <br> rotate to move the exit tray up to the reference position. |

- For details of the amount of paper stacking at the paper exit tray, see "C PRODUCT SPECIFICATIONS/FS-533".

## PJ THEORY OF OPERATION FS-534/FS-534SD/RU-513/PK-520

## 1. FINISHER OUTLINE

- Install the staple finisher FS-534 to the MFP enables the following functions. "Sort function, Sort offset function", "Group function, Group offset function", "Staple function", "Sort staple function", and "Large capacity receiving function".
- The "Punch function" can be added by installing the optional function (Punch Kit PK-520)
- On the staple finisher FS-534SD, "Saddle stitching function and Tri-folding function" is provided in addition to all functions that are provided on the staple finisher FS-534

| Option |  |
| :--- | :--- |
| RU-514 | Connecting the MFP with the FS-534 |
| PK-520 | Punch function |
| FS-534SD | FS-534 + Folding function, Saddle stitching function, Tri-folding function |

## 3. CONFIGURATION

### 3.1 Section configuration

- The staple finisher FS-534 is installed with the finisher main body being fixed on the left side of the MFP. At the time of maintenance, open and close the RU door, the upper door and front door on the finisher. A docking mechanism to slide the finisher from the MFP is not provided.
- The FS-534 comes standard with a sorting mechanism and a stapling mechanism.
- The FS-534SD includes folding function, saddle stitching function, and tri-folding function in addition to all of the functions of the FS-534.
- Also, the optional punch kit PK-520 and the saddle stitcher can be added to the FS-534/534SD.
- At maintenance of the FS-534SD saddle section, pull the saddle section frontward from the finisher.

## 4. FNS SECTION

### 4.1 Door open/close detection mechanism

### 4.1.1 Front door open/close detection mechanism

- The front door open detect switch installed at the front right of the FNS section detects open/close of the finisher's front door.
- Open the front door, the warning screen will display on the control panel. All the setting operations and jobs are disabled while the warning screen is displayed. The printing job is interrupted, and the paper being transported causes a paper misfeed. The warning screen can be cancelled by closing the door.

[1] Front door open detect switch (SW1)
[2] Front door

### 4.1.2 Upper door open/close detection mechanism

- The upper cover open/close detection sensor is installed at the front left of the FNS section to detect open/close of the finisher upper door.
- Open the upper door, the warning screen will display on the control panel. All the setting operations and jobs are disabled while the warning screen is displayed. The printing job is interrupted, and the paper being transported causes a paper misfeed. The warning screen can be cancelled by closing the door.

| :--- | :--- | :--- | :--- |
| $[3]$ | Upper cover open/close detection sensor (PS32) | $[4]$ | Upper door lock magnet |

## 5. RU SECTION (RU-513)

### 5.1 Configuration

- The RU section (horizontal transport section) transfers paper that is fed out from the MFP paper exit section to an optional finisher paper feed section.
- The RU door is installed at the upper part of the RU section. Access to the horizontal transport roller is enabled by opening the door upward. To be used for periodical cleaning of the roller and dealing with the paper misfeed at the RU section and other necessary operations.

| $[1]$ | 3rd exit tray full sensor (PS1): Exit section of MFP | $[2]$ | 3rd exit tray full sensor actuator: Exit section of MFP |

RU section door is opened

[2]

| $[1] ~ R U ~ s e c t i o n ~ d o o r ~$ | [2] Horizontal transport section |
| :--- | :--- | :--- |

### 5.2 Drive

- The RU transport motor drives the RU section. It drives three RU section horizontal transport roller.
- The RU section horizontal transport roller is driven using the drive belt.

| $[1]$ | RU section horizontal transport roller/1 | $[2]$ | RU section horizontal transport roller/2 |
| :--- | :--- | :--- | :--- |
| $[3]$ | RU section horizontal transport roller/3 | $[4]$ | RU transport motor (M1) |

### 5.3 Operation

### 5.3.1 Paper transport control

- It transports the paper that is discharged from the lower exit of the MFP paper exit section, to the RU section with the feed guide.
- It transports the paper to the FNS section, using three RU section horizontal transport rollers.
- The RU entrance sensor actuator is installed downstream of the paper path of the RU section horizontal transport roller/1, and the RU entrance sensor detects the paper transportation status.

## Perspective view

| $[1]$ | 3rd exit tray full sensor (PS1) | $[2]$ | 3rd exit tray full sensor actuator |
| :--- | :--- | :--- | :--- |

[1]

[2]

| $[1]$ | RU door |
| :--- | :--- |
| [2] $\quad$ RU cover open/close detection sensor (PS3) |  |

### 5.3.3 3rd exit tray full detection mechanism

- When a predetermined quantity of paper is discharged to the 3rd exit tray, the 3rd exit tray full sensor actuator will be pushed up by the discharged paper. When the actuator is pushed up to the predetermined position, the 3rd exit tray full sensor will be blocked by the actuator to detect the exit tray full.
- The 3rd tray full is detected, the warning screen will display on the control panel. All setting operations and jobs will be disabled when the warning message is displayed on the screen. The warning screen will be released by removing the paper on the 3rd exit tray.

## 6. PUNCH SECTION (PK-520)

### 6.1 Configuration

- The punch function can be added to the finishing mode by installing the optional punch kit PK-520 to the finisher FS-534.
- At the punch section, the holes are punched at the trailing edge of the paper, transported from the RU section (horizontal transport section) when the paper is fed into the FNS section (finisher section). Holes are punched sheet by sheet.
- The punch kits for North America, Europe, and other market areas have the configuration to switch the number of punch holes. NOTE
- 2-hole punch kits and 4-hole punch kits do not have the function to switch the number of punch holes.
- "Finishing" cannot be selected using a different punch kit. (Example: The three-hole punch mode cannot be selected when the 4-hole punch kit is installed.)
- Punch dust generated by punching is received in the punch dust box.
- The paper with punched holes is transported to the transport section from the punch section.
- When the punch holes are not specified at "Finishing", the paper is transported to the transport section from the FNS paper feed section without punching holes.
[1]

[2]

- *2: The number of the puncher is varied depending on the type of punch kit.
- *3: The shape of the puncher frame is varied depending on the type of punch kit. 2 holes punch kit does not have the puncher frame 2.

### 6.1.1 Punch kit type

2 holes/3 holes kit (Selectable the hole number)

- Attachable marketing area: Europe, US, Others 1-5

2 holes/4 holes kit (Selectable the hole number)

[^58]2 holes punch kit

- Attachable marketing area: Japan

4 holes punch kit

- Attachable marketing area: Europe

### 6.2 Drive

- The drive source for the punch section is the punch drive motor. The puncher frame is driven in forward/reverse direction by rotating the punch drive motor in forward/reverse direction.
- When the puncher frame moves in forward/reverse direction, the puncher moves up/down by the cam of the puncher frame to punch the holes on the paper.
- Puncher frame 1 and the puncher frame 2 have cams with different shapes. It enables the puncher to move up/down at different timings.
- When the puncher drive gear rotates clockwise, the puncher frame 1 shifts to the front side, and the puncher frame 2 shifts to the back side. When the puncher drive gear rotates counter-clockwise, the puncher frame 1 shifts to the back side, and the puncher frame 2 shifts to the front side. The puncher connected to the puncher frame then moves up/down with the cam. Switching the forward/reverse direction of the punch drive motor, switches the number of punch holes.

Front view

| $[1]$ | Puncher frame $1 * 1$ | $[2]$ | Puncher *2 |
| :--- | :--- | :--- | :--- |
| $[3]$ | Puncher drive gear | $[4]$ | Punch drive motor (M1) |

- *1: The shape of the puncher frame is varied depending on the type of punch kit.
- *2: The number of the puncher is varied depending on the type of punch kit.

## NOTE

- The illustration explains with an example for "2-holes/3-holes kit".
- With "2 holes/3 holes kit", the 2-holes puncher moves down when the puncher drive gear rotates clockwise. When the puncher drive gear rotates counter-clockwise, the 3-holes puncher moves down. The number of the punch holes is switched by the same configuration for "2-holes/4-holes kits"
- The "2-holes kit" and the "4-holes kit" do not have the punch hole switching function.

Upper view

| $[1]$ | Punch home sensor (PS1) | $[2]$ | Punch position sensor (PS2) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Puncher frame 1 | $[4]$ | Puncher frame 2 |
| $[5]$ | Puncher drive gear | - | - |

### 6.3 Operation

### 6.3.1 Skew correction mechanism

- When punching holes, punch resist loop is formed upstream of FNS section transport roller/1 to remove the skew of the paper.

| $[1]$ | FNS section paper feed roller | $[2]$ | RU section horizontal transport roller/3 |
| :--- | :--- | :--- | :--- |
| $[3]$ | FNS entrance sensor (PS4) | $[4]$ | Puncher |
| $[5]$ | RU transport motor (M1) | $[6]$ | FNS entry transport motor (M2) |
| $[7]$ | Main tray exit sensor (PS16) | $[8]$ | FNS section transport roller |

## (1) Skew correction process

1. The paper is transported to the FNS section (finisher section) by the RU transport motor driving the RU section horizontal transport roller/3.
2. When the leading edge of the paper reaches to the FNS section paper feed roller, it is detected by the FNS entrance sensor.
3. The paper is pressed to the FNS section paper feed roller which is at a halt to form the loop at the leading edge of the paper to remove the skew of the paper.
4. The FNS entry transport motor is turned ON when the specified period of time has passed after the leading edge of the paper turns the FNS entrance sensor ON, to start rotating the FNS section paper feed roller and the FNS section transport roller.
5. The paper which skew is removed is transported to the punch section by the FNS section paper feed roller, and then stop the specified position.
6. The holes are punched by the puncher.
7. The punched paper is transported to inside the transport section by the FNS section transport roller.

| $[1]$ | FNS section paper feed roller | $[2]$ | Paper |
| :--- | :--- | :--- | :--- |
| $[3]$ | The resist loop is created at the leading edge of the <br> paper | $[4]$ | FNS entrance sensor (PS4) |
| $[5]$ | Puncher | $[6]$ | Main tray exit sensor (PS16) |
| $[7]$ | FNS section transport roller | - | - |

## (2) Punch Regist Loop Size Adjustment function

- Then the punch holes tilt, punch resist value for the Service Mode can be adjusted to adjust the punch holes.
- Punch resist value (resist loop value) changes by changing the timing the FNS section paper feed roller starts rotating. Tilt of the punch holes can be adjusted by removing the skew of the paper at the resist loop.
- For details of the adjustment procedures, see "Service Mode/Finisher/FS-FN adjustment/Punch Registration Loop Adj."
(a) Setting range
- -4.0 to +4.0

### 6.3.2 Puncher up/down status detection configuration

- When the puncher drive gear rotates clockwise, the puncher frame 1 shifts to the front side, and the puncher frame 2 shifts to the back side. When the puncher drive gear rotates counter-clockwise, the puncher frame 1 shifts to the back side, and the puncher frame 2 shifts to the front side. The puncher connected to the puncher frame then moves up/down with the cam. Switching the forward/reverse direction of the punch drive motor, switches the number of punch holes. PJ.6.2 Drive
- Puncher frame 1 has two light-blocking plates to detect the position of the puncher frame.
- The punch drive motor has a round light-blocking plate and the puncher motor sensor on the same shaft to detect the rotation value (pulse) of the punch drive motor.
- The Up/down status of the puncher is detected by the coordination input from the puncher position sensor, punch home sensor, and the punch motor sensor.
Rear view

### 6.3.3 Punch operation noise suppression

(1) Sound-absorbing material for punching operation

- A sound-absorbing material is installed inside the finisher upper door.
- It absorbs noises that are generated during punch operation with the punch unit to suppress it from being leaked out of the machine.

[1] Upper door $\quad$ [2] Sound-absorbing material*
- *: The sound-absorbing material does not require to be replaced on a regular basis.
(2) Punching operation noise suppression control
- The punching force of the punch motor is controlled in accordance with the thickness of the paper (paper weight).
- It suppresses noises that are generated during plain paper punching operation with the punch unit.
- Use $100 \%$ punching force for punching thick paper. Use $60 \%$ punching force for punching paper other than thick paper. Thus, it reduces the operation noise during paper punching.

## NOTE

- The punching operation noise reduction control can be disabled when the Engine FW DipSW switch No. 17 is turned to Off. For details on setting, see Engine FW DipSW .

### 6.3.4 Punch dust box full detection mechanism

- Punch dust created by punching holes on the paper, is collected in the punch dust box.
- The punch unit has a sensor to detect a punch dust full condition at the front side (emission) and the back side (receiving). The sensor detects the status of the punch dust.
- When the punch dust is accumulated inside the punch dust box, the sensor light on punch dust full sensor/out side is interfered by the punch dust. The punch dust box is determined to be full when the sensor light is blocked. A message is displayed on the control panel to indicate a "punch dust full" condition when a punch dust box full is detected.
NOTE
- When the punch dust box is removed, the sensor light on punch dust full sensor/out side is blocked by the actuator on the punch unit. When the front door is closed is point and the punch job is set a message is displayed on the control panel to indicate a "Punch dust full" condition.
" When the empty punch dust box is installed, the sensor light blocked by the actuator, reaches punch dust full sensor/in, and the "punch dust full" message on the control panel disappears.

| $[5]$ | Punch dust blocked the sensor light | - | - |

Punch dust full message: typical
(1) Unit change function

- The screen to be displayed when a punch dust full is detected can be enabled or disabled in the "Unit Change" in the Service Mode.

Service Mode/System screen: typical

System 2/Unit Change screen: typical

NOTE

- The Service Mode screen display, details, menus, and default settings may change when the FS-534 is installed to the MFP.
" For details of the Service Mode, see "Unit Change".

## 7. TRANSPORT SECTION

### 7.1 Configuration

### 7.1.1 Paper path

- The transport section transports the paper from the RU section (horizontal transport section) to the three paper paths within the FNS section (finisher section).

## (1) Paper path to the sub tray

- The paper path switching gate, moves the paper transported from the RU section to the sub tray paper path to discharge the paper to the sub tray. NOTE
" The paper is directly discharged to the sub tray without passing through the alignment and exit sections. If "Sub Tray" is selected as exit tray for a print job, the offset option (sort/group/staple) is unavailable.
(2) Paper path to the main tray
- The paper path switching gate moves the paper transported from the RU section to the main tray paper path. The paper passes through the alignment and exit sections, and then moves to the main tray.
(3) Paper path to the saddle section

NOTE

- FS-534SD only
- The paper path switching gate moves the paper transported from the RU section to the main tray paper path. Switchback of the paper is done at the transport section and then the paper passes through the vertical transport section, and moves to the saddle section.

### 7.2 Drive

The driving source of the FNS section is the FNS entry transport motor, FNS discharge motor, and receiving roller retraction motor, and the following parts are driven.

| Driving source | Driving parts | Functions |
| :---: | :---: | :---: |
| FNS entry transport motor (M2) | FNS section paper feed roller | Feeds paper to the FNS section |
|  | FNS section vertical transport roller | Transports paper to each paper path in the FNS section. |
|  | Paper path switching gate | Switches paper path by the paper path switching gate up/down movement triggered by the cam. |
|  | Sub tray section vertical transport roller | Transports paper to the sub tray section exit roller. (sub tray paper path) |
| FNS discharge motor (M3) | Sub tray section exit roller | Transports paper to the sub tray. (sub tray paper path) |
|  | Receiving roller | - Normal rotation: Transports paper to alignment section. (main tray paper path) <br> - Reverse rotation: Transports paper to the saddle section. (saddle section paper path) |
|  | FNS section exit roller | Transports paper from the alignment section to the saddle section via the switchback. (saddle section paper path) |
| Receiving roller retraction motor (M4) | Receiving roller pressure roll | The receiving roller pressure roll is moved up/down by the cam. (main tray paper path) <br> - When the pressure roll is lowered, the paper on the receiving roller is pressed against the receiving roller. When the receiving roller rotates in the normal direction, the paper is transported to the alignment section. When the receiving roller rotates reversely, the paper is switched back through the transport path to the saddle section. <br> - When the pressure roll moves up, the paper on the receiving roller is released. The paper is not transported and brought into a standby state. |

### 7.2.1 FNS entry transport motor

### 7.2.2 FNS discharge motor

| $[1]$ | FNS discharge motor (M3) | $[2]$ | Sub tray section exit roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Receiving roller | $[4]$ | FNS section exit roller |

### 7.2.3 Receiving roller retraction motor

| $[1]$ | Receiving roller pressure cam | $[2]$ | Receiving roller retraction motor (M4) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Receiving roller * | $[4]$ | Receiving roller pressure roll |

- *: The driving source of the receiving roller is the FNS discharge motor. The driving source of the receiving roller pressure roll is the receiving roller retraction motor.

### 7.3 Operation

### 7.3.1 Paper path switching mechanism

- Paper path is switched by the up/down operations of the paper path switching gate to transport paper to each tray or the saddle section.
- The up/down operations of the paper path switching gate is driven by the FNS entry transport motor.
- The position of the paper path switching gate is detected by the exchange folded paper output sensor.

Front perspective view

| $[1]$ | FNS entry transport motor (M2) | $[2]$ | Sub tray section vertical transport roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper path switching gate | $[4]$ | FNS section transport roller |
| $[5]$ | FNS section paper feed roller | - | - |

## (1) Gate lower position (paper path: sub tray)

- When the cam rotates, the paper path switching gate moves down to block the paper path to the main tray. The paper passes on the top of the paper path switching gate and is transported to the sub tray.
- When the detection plate located on the shaft, on which the cam is located, rotates, the exchange folded paper output sensor is unblocked. This causes machine to determine that the gate is at the lower position.
- When the paper is transported through the sub tray paper path, the sub tray exit sensor located downstream of the paper path switching gate detects the paper conveyance.

Front view: Illustration on the relationship between the cam and paper path switching gate

| $[1]$ | Paper | $[2]$ | Paper path switching gate (lower position) |

| $[1]$ | Paper | $[2]$ | Exchange folded paper output sensor (PS30) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Detection plate | - | - |

(2) Gate upper position (paper path: main tray)

- When the cam rotates, the paper path switching gate moves up to block the paper path to the sub tray. The paper passes on the bottom of the paper path switching gate and is transported to the main tray.
- When the detection plate located on the shaft, on which the cam is located, rotates, the exchange folded paper output sensor is blocked. This causes machine to determine that the gate is at the upper position.
- When the paper is transported through the main tray paper path, the main tray exit sensor located downstream of the paper path switching gate detects the paper conveyance.
Front view: Illustration on the relationship between the cam and paper path switching gate

[3]

| $[1]$ | Paper | $[2]$ | Exchange folded paper output sensor (PS30) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Detection plate | - | - |

### 7.3.2 Sub tray exit mechanism

- Paper transported from the RU section is discharged to the sub tray by the sub tray section exit roller, via the FNS section paper feed roller, FNS section transport roller, and sub tray section vertical transport roller.
- To transport paper to the sub tray, the paper path switching gate also operates.
- The sub tray section exit roller is driven by the FNS discharge motor.

| $[1]$ | FNS entry transport motor (M2) | $[2]$ | FNS discharge motor (M3) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Sub tray full detection sensor/out (PS9) | $[4]$ | Sub tray section exit roller |
| $[5]$ | Paper | $[6]$ | Sub tray |
| $[7]$ | Upper cover open/close detection sensor (PS32) | $[8]$ | Sub tray full detection sensor/in (PS10) |
| $[9]$ | Sub tray exit sensor (PS8) | - | - |

### 7.3.3 Receiving roller section up/down function

- The up/down movement of the receiving roll, switches the timing of transporting the paper to the alignment section. (Buffer control)
- The up/down operations of the receiving roll are driven by the receiving roller retraction motor.
- The position of the receiving roll is detected by the receiving roller retraction sensor

Front perspective view

| $[1]$ | Receiving roller | $[2]$ | Receiving roll |
| :--- | :--- | :--- | :--- |
| $[3]$ | Receiving roller pressure cam | $[4]$ | Detection plate |
| $[5]$ | Receiving roller retraction motor (M4) | $[6]$ | Receiving roller retraction sensor (PS11) |

## (1) Receiving roller: pressure position

- When the cam rotates, the receiving roll is lowered and pressed against the receiving roller. The paper is transported to the alignment section by the receiving roller.
- When the detection plate located on the shaft, on which the cam is located, rotates, the receiving roller retraction sensor is unblocked. This causes machine to determine that the receiving roll moves down (pressed).

Front view: Illustration on the relationship between the cam and roll

| $[1]$ | Receiving roller pressure cam (pressure position) | [2] | Receiving roll (pressure position) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Receiving roller | - | - |

Front view: Illustration on the relationship between the detection plate and sensor

| $[1]$ | Detection plate (pressure position) | $[2]$ | Receiving roller retraction sensor (PS11) (unblocked) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Receiving roll (pressure position) | $[4]$ | Receiving roller |

## (2) Receiving roller: release position

- The receiving roll is lifted by the cam and retracted from the receiving roller. The paper is brought to a standby state on the transport paper path.
- The detection plate located on the shaft, on which the cam is located, rotates and blocks the receiving roller retraction sensor. This causes machine to determine that the receiving roll moves up (retracted).
Front view: Illustration on the relationship between the cam and roll

| $[1]$ | Receiving roller pressure cam (release position) | $[2]$ | Receiving roll (release position) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Receiving roller | - | - |

Front view: Illustration on the relationship between the detection plate and sensor

| $[1]$ | Detection plate (release position) | $[2]$ | Receiving roller retraction sensor (PS11) (blocked) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Receiving roll (release position) | $[4]$ | Receiving roller |

### 7.3.4 Buffer control

- The receiving roller section up/down mechanism is provided to achieve high productivity, by eliminating the time loss for the next sheet of paper during the offset and staple operations.
- This allows handling a print job without reducing the paper transport speed even under the condition where the preceding sets of sheets are being aligned and stapled.
Front view

| $[1]$ | FNS section transport roller | $[2]$ | Paper path switching gate |
| :--- | :--- | :--- | :--- |
| $[3]$ | Movable paper guide | $[4]$ | Receiving roll |
| $[5]$ | Receiving roller | $[6]$ | Alignment tray |
| $[7]$ | Staple unit | $[8]$ | FNS section exit roller |

## (1) Paper transport operation

- The following explains the example of a print job where 5 sheets of paper is stapled together and 2 sets are output.

1. When the first set of paper passes, the receiving roll transports the paper to the alignment section without being lifted. The 5 sheets of the first set are aligned and then stapled.

[1] First sheet in the second set
[2] FNS section transport roller (forward rotation)
[3] Paper path switching gate (upper position)
[4] Receiving roll (pressure, forward rotation)
[5] First set of sheets (transported to the alignment section)
2. While the first set of sheets is being aligned, the first sheet in the second set causes the receiving roller to rotate in the reverse direction when the trailing edge of the sheet passes the movable paper guide. This causes the first sheet to move on the switchback until its trailing edge reaches the path to the saddle section. (This operation is performed to avoid blocking the paper path for the second sheet.)

[1] Movable paper guide
[2] Receiving roll (pressure, reverse rotation)
[3] First sheet in the second set (switchback)
[4] FNS section exit roller (reverse rotation)
3. The receiving roll is lifted. The first sheet of paper that lost the force of being transported stays on the transport path.
4. While the first set is being stapled, the second sheet of the second set is transported and it is placed on the top of the first sheet of the second set.

[1] Second sheet of the second set
[2] FNS section transport roller (forward rotation)
[3] Paper path switching gate (upper position)
[4] Receiving roll (release, stop)
[5] First sheet (staple)
5. The receiving roll is lowered onto the 2 nd set. Two sheets of the second set are discharged to the alignment section. (Paper transport time is reduced by moving multiple sheets in one paper transport operation.)
6. While the first and second sheets of the second set are transported to the alignment section, the stapled first set is discharged to the main tray.

[1] FNS section transport roller (forward rotation)
[2] Receiving roll (pressure, forward rotation)
[3] Second sheet of the second set
[4] First sheet in the second set
[5] First set of sheets
[6] FNS section exit roller (forward rotation)
7. The receiving roll is not lifted when the third to fifth sheets of the second set passes through the roller. These sheets are transported to the alignment section in the normal manner.
8. When the fifth sheet of the second set is transported to the alignment tray, the second set is stapled.
9. The operations described above are repeated when multiple staple jobs are performed.

## 8. ALIGNMENT SECTION

### 8.1 Configuration

In the alignment section, paper transported from the transport section is aligned and discharged to the main tray

1. Upper paddle section

- Paper ejected from the receiving roller in the transport section is guided to the alignment section by the lowered paper guide.
- The paper led to the alignment section will be switchbacked to the alignment tray by the upper paddle.

2. Exit section (Receiving operation)

- The paper is switched back to the alignment tray by the lower paddle.

3. Stopper section

- The paper that was switched back is aligned at its trailing edge by being pressed to the trailing edge stopper. (Paper alignment operation in FD)
- If paper is stapled (2-point stapling), the stopper is retracted to the position where it does not interfere with the trailing edge stopper/F and trailing edge stopper/R.

4. Alignment tray section

- When the first sheet is sent, the alignment plate is moved to the center to support the paper passing through the top of the plate. (Alignment plates are used as paper guide.)
- If paper is not offset stacked, it is placed between the alignment plates so that both ends of the paper are aligned at the center position of the alignment tray. (Paper alignment operation in CD)
- The paper gathered at the front or rear side on the alignment plate will be aligned on both sides of the paper. This process is repeated to sort out the paper. (CD alignment and shift operation of the paper)

5. Exit section (Exit operation)

- The trailing edge stopper/C is shifted to press the paper out, and then the gripper receives the paper. The gripper then discharges the paper to the main tray.

### 8.2 Drive

### 8.2.1 Drive outline

The driving source of the alignment section is the FNS paddle motor, pre-eject drive motor, bundle eject motor, trailing edge stopper motor, alignment motor, and the following parts are driven.

| Driving source | Driving parts |  |
| :--- | :--- | :--- |
| FNS paddle motor (M5) | Paper guide | Transports paper to the alignment tray. |
|  | Upper paddle | Draws and drops paper to the alignment tray. |
| Pre-eject drive motor (M9) | Lower paddle | Presses paper against the stopper in the alignment tray. |
|  | Trailing edge stopper/C | • Aligns the trailing edge of paper (Alignment operation in FD) |

| Driving source | Driving parts |  |
| :--- | :--- | :--- |
|  |  | • Pushes paper out to the main tray after alignment. |
| Bundle eject motor (M10) | Paper transport belt | Moves the gripper. |
|  | Gripper | Grips the trailing edge of paper and discharges it to the main tray. |
| Trailing edge stopper motor <br> (M6) | Trailing edge stopper /Fr | Moves the trailing edge stopper/Fr forward. It moves back and forth according to the <br> paper width to keep the trailing edge of the paper batch at the front side. |
|  | Trailing edge stopper /Rr | Moves the trailing edge stopper/Rr backward. It moves back and forth according to <br> the paper width to keep the trailing edge of the paper batch at the back side. |
| Alignment motor/Front (M7) | Alignment plate/F | • Aligns both ends of paper (Alignment operation in CD) |
| Alignment motor/Rear (M8) | Alignment plate/R | • Pushes paper to the front or rear. (Shift operation) |

### 8.2.2 Upper paddle section

- When the FNS paddle motor rotates, the upper paddles (3 pieces) located on the upper paddle shaft, rotates to draw and drop the paper to the alignment tray.
- The cam located on the upper paddle shaft rotates to move the paper guide up and down.

Front perspective view

| $[1]$ | Cam | $[2]$ | Upper paddle (rear) |

| $[3]$ | Upper paddle (lower position: make a turn and return to <br> home position.) | - | - |

### 8.2.3 Exit section

- When the pre-eject drive motor rotates clockwise, the lower paddle rotates to press the paper against the trailing edge stopper.
- When the pre-eject drive motor rotates counterclockwise, the trailing edge stopper moves from the home position to the paper exit position to discharge paper to the main tray. When the drive gear makes a turn, the stopper moves from the paper exit position to the home position and is brought into a standby state.

| $[3]$ | Drive gear | $[4]$ | One-way clutch (for trailing edge stopper driving: transmit <br> driving force only to counterclockwise rotation) |
| $[5]$ | Pre-eject drive motor (M9): counterclockwise rotation | - | - |

## (2) Gripper section

- The bundle eject motor rotates to turn the paper transport belt. This causes the gripper, fixed to the paper transport belt, to rotate.

Front perspective view

| $[1]$ | Gripper position detection sensor (PS19) | $[2]$ | Gripper home position sensor (PS18) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Gripper | $[4]$ | Bundle eject motor (M10) |
| $[5]$ | Gripper motor sensor (PS17) | $[6]$ | Paper transport belt |

- The gripper stays at the home position (inside the exit section). It rotates at the position [1] shown in the illustration to grip the trailing edge of paper and transport the paper while keeping the state [2]. The gripper rotates at the position [3] in the illustration to release the paper. When the paper transport belt makes a turn, the gripper returns to the home position [5] and is brought into a standby state.

## Gripper drive front view

| $[1]$ | Gripper position (gripping the paper) | $[2]$ | Gripper position (transporting the paper) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Gripper position (release the paper) | $[4]$ | Paper transport belt |
| $[5]$ | Gripper (home position) | $[6]$ | Bundle eject motor (M10) |
| $[7]$ | Gripper home position sensor (PS18) | $[8]$ | Gripper position detection sensor (PS19) |

### 8.2.4 Stopper section

- The shaft for stopper movement has a different spiral between the front and rear sides. This causes trailing edge stopper/Fr to move forward and trailing edge stopper/Rr to move backward when the trailing edge stopper motor rotates in the normal direction.
- Trailing edge stopper/F and the trailing edge stopper/R shift according to the paper width before starting a job, to hold the trailing edge of the paper.
- For 2-point staple jobs, the trailing edge stoppers/Fr and /Rr are retracted to the position where they do not interfere with the stapler.
- After the job is completed, the trailing edge stopper motor reverses the rotation to return the trailing edge stopper to the home position.

Front perspective view

| $[1]$ | Stopper moving shaft | $[2]$ | Trailing edge stopper home position detection sensor <br> (PS20) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Trailing edge stopper motor (M6) | $[4]$ | Trailing edge stopper/Fr: home position |
| $[5]$ | Trailing edge stopper/Rr: home position | - | - |

### 8.2.5 Alignment tray section

- The normal or reverse rotation of the alignment motor, allows the normal or reverse rotation of the drive belt. This causes the alignment plates to move forward or backward.
- Alignment plates/F and /R are each equipped with a drive motor, allowing them to operate independently. This enables paper alignment to the center, as well as paper shift to the front and rear.

| $[1]$ | Alignment motor/Rear (M8) | $[2]$ | Alignment plate/R home sensor (PS13) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Alignment plate /R: home position | $[4]$ | Alignment plate /F: home position |
| $[5]$ | Alignment plate/F home sensor (PS12) | $[6]$ | Alignment motor/Front (M7) |

### 8.3 Operation

### 8.3.1 Paper transport control in alignment section

Paper transported to the alignment section, is conveyed and aligned with the following operations.

1. The receiving roller in the transport section ejects paper *1.

NOTE

- *1: For plain paper, due to buffer control, the first and second sheets of paper are ejected at the same time. For other than plain paper, the first paper is ejected.
For details of the buffer control, see "PJ.7.3.4 Buffer control".
- The description below explains the paper transport control for plain paper.

2. The alignment plates/ $F$ and $/ R$ are moved to the center.
3. The first and second sheets are transported onto the top of the alignment plates.

NOTE

- This is to prevent the leading edge of the sheets from touching the lower paddle and being folded.

[1] Receiving roller
[2] First and second sheets (for plain paper)
[3] Receiving roll
[4] Alignment plate/F, Alignment plate/R (moved to the center)

4. The alignment plates return their home position. The alignment plate/F and the alignment plate/R shift to the waiting position according to the paper width immediately before the trailing edge of the paper passes the receiving roller.
5. When the trailing edge of the sheet passes through the receiving roller, the paper guide is lowered to guide the trailing edge of the sheet to the alignment tray.
6. The upper paddle rotates, and the upper and lower paddles grip the sheet. The sheet is transported into the alignment tray. (Operation on switchback) The sheets are transported into the alignment tray and are stopped by the trailing edge stopper. This allows aligning the trailing edge of the sheets. (paper alignment operation in FD)

[1] Receiving roller
[2] Receiving roll
[3] First and second sheets
[4] Alignment plate/F, Alignment plate/R (Retracted to the home position)
[5] Lower paddle (rotation)
7. The alignment plates move to align the ends of the sheets. (Paper alignment in CD)

- The sheets are placed between the alignment plates/F and/R corresponding to the paper width so that their both ends are aligned. Upper view

[1] Paper
[2] Alignment plate /R (moving forward to front side)
[3] Alignment plate/F (moving backward to rear side)
- The alignment operations described above are performed for all sheets of paper in the job to align the ends of the sets of paper.

8. When offset is selected as finishing option, the alignment plates are moved to shift the sets of paper.

- Depending on the width of paper, the alignment plate/F or /R pushes the sets of paper to the rear side (or to the front side) from one side so that the sets of the paper are shifted.
Upper view

[1] Alignment plate/R
[2] Paper
[3] Alignment plate/F
NOTE
- The offset of paper (amount of shift) is 20 mm (13/16 inches).
- The sheets are shifted by alternatively repeating the above operation

9. The third sheet is ejected by the receiving roller of the transport section.

[1] Receiving roller
[2] Third sheet
[3] Receiving roll
[4] Paper guide (upper position)
10. When the trailing edge of the sheet passes through the receiving roller, the paper guide is lowered to guide the trailing edge of the sheet to the alignment tray
11. The upper paddle rotates. The sheet is transported into the alignment tray. (Operation on switchback)

NOTE

- When the switchback operation for the 3rd sheet or later, the lower paddle does not rotate.

[1] Trailing edge stopper
[2] Upper paddle (rotation)
[3] Paper
[4] Lower paddle (rotation)

12. The sheet is stopped by the trailing edge stopper. This allows aligning the trailing edge of the sheets. (Paper alignment operation in FD)
13. The alignment plates move to align the ends of the sheets. (Paper alignment operation in CD)

NOTE

## - CD alignment operation is omitted since it is described in steps 7 to 8.

14. For staple mode, the trailing edges of the sheets are stapled at this timing.
15. When all paper alignment is completed, the trailing edge stopper pushes the sheets to the position where the gripper can grip them.
16. The gripper grips the trailing edges of the sets of paper in the alignment tray and transports them to the paper exit position.

[1] Trailing edge stopper/C (paper gripping position)
[2] Paper guide (upper position: home position)
[3] Upper paddle (upper position: home position)
[4] Gripper (move)
[5] Paper bunch
[6] Paper transport belt (rotation)
17. The gripper releases the sets of paper to discharge them to the main tray. The gripper is moved to the home position and brought into a standby state.

## 9. STAPLER SECTION

### 9.1 Configuration/Drive

In the stapler section, staples are pressed through the sheets aligned in the alignment section so that the sheets are fastened together as a batch.

### 9.1.1 Configuration

Front perspective view

| $[1]$ | Side stapler movement motor (M13) | $[2]$ | Stapler home position sensor (Rear) (PS23) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Shaft | $[4]$ | Stapler unit |
| $[5]$ | Stapler position sensor (Center) (PS24) | $[6]$ | Stapler move dial |
| $[7]$ | Staple cartridge | - | - |

Front view

| $[1]$ | Stapler unit | $[2]$ | Stapler home position sensor (Rear) (PS23) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Stapler position sensor (Center) (PS24) | $[4]$ | Side stapler movement motor (M13) |
| $[5]$ | Shaft | $[6]$ | Stapler holder |

### 9.1.2 Drive

- The driving source of the staple section is the side stapler movement motors, stapler motor built into the staple unit, and the following parts are driven.

| Driving source | Driving parts | Function |
| :--- | :--- | :--- |
| Side stapler movement <br> motor | Staple unit | Back and forth movement and rotation of the stapler unit |
| Stapler | Clincher staple arm | Fastening of sheets with staples |

- When the side stapler movement motor rotates, the belt is driven by the pulley and the stapler holder attached to the belt moves back and forth along the shaft.
- When the staple unit moves to the stapler home position, the staple cartridge replacement or the corner staple position, the shape of the slide guide plate causes the staple unit to rotate.

## NOTE

- The staple unit is rotated at the staple cartridge replacement position to ease replacement work.

Front perspective view

| $[1]$ | Stapler home position sensor (Rear) (PS23) | $[2]$ | Stapler unit (home position) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Stapler unit (2-staple position) | $[4]$ | Stapler unit (2-staple position) |
| $[5]$ | Stapler unit (staple cartridge replacement position) | $[6]$ | Stapler position sensor (Center) (PS24) |
| $[7]$ | Slide guide plate | - |  |

### 9.2 Operation

### 9.2.1 Stapler positioning control

## (1) Stapler home position detection control

- The stapler home position sensor (rear) detects the stapler home position. The stapler's staple position is detected by the amount of motor rotation provided by the stapler home position sensor (rear) and stapler position sensor (center).
- In the corner staple mode, the stapler moves to the corner staple position and staples paper.
- In the 2-staple mode, the stapler moves to the 2-staple position (rear) and staples paper. Then it moves to the next 2-staple position (front) and staples the paper. After the stapling operation is completed, the stapler returns to the home position.
Upper view

[8]

| $[1]$ | Stapler home position sensor (Rear) (PS23) | $[2]$ | Stapler unit (home position) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Stapler unit (2-staple position: rear) | $[4]$ | Stapler unit (2-staple position: front) |
| $[5]$ | Stapler position sensor (Center) (PS24) | $[6]$ | Stapler unit (staple cartridge replacement position) |
| $[7]$ | Slide guide plate | $[8]$ | Side stapler movement motor (M13) |

## (2) Staple cartridge replacement position detection control

- The stapler position sensor (center) detects the staple cartridge replacement position. (The stapler determines that it arrives at the replacement position based on how much the side stapler movement motor rotates after the stapler passes the stapler position sensor (center).
- When staple empty is detected, the staple unit moves to the staple cartridge replacement position, rotates, and stays at the position
- User can replace the staple cartridge by opening the front door. NOTE
- Using the stapler move dial, user can replace the staple cartridge without moving the staple unit.
- When staple cartridge replacement is completed and the front door is closed, the stapler returns to the home position.

### 9.2.2 Stapling control

(1) Stapling operation

- The stapling operation is driven by the stapler motor.
- In the stapling operation, the clincher staple arm is lowered by the stapler motor. The clincher staple arm presses the sheets. (This is called clamp operation.) Then a staple is pushed up by the staple arm from the stapler side. The staple is pressed through the sheets and bent from the clincher staple arm side, so that the sheets are fastened together. The stapler motor then lifts the clincher staple arm and lowers the staple arm to complete the stapling operation
- The number of sheets that user wishes to staple are placed into the alignment tray and the stapling operation is performed. However, if the number exceeds the upper limit, the stack of sheets is discharged to the exit tray without being stapled. NOTE
- Refer to Sort staple for the specifications on the number of sheets that can be stapled.

Overall view

[3]

| $[1]$ | Clincher staple arm | $[2]$ | Staple cartridge |
| :--- | :--- | :--- | :--- |
| $[3]$ | Stapler motor | - | - |

Front view

| $[1]$ | Staple cartridge | $[2]$ | Clincher staple arm |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper bunch | $[4]$ | Staple sheet (staple) |
| $[5]$ | Stapler | $[6]$ | Stapler motor |

### 9.2.3 Staple empty detection control

## (1) Staple cartridge

- The stapler is provided with a staple cartridge used only for the stapler.
- To reload the stapler with staples, the staple cartridge is first loaded with staples (staple sheet type: 5000 staples) and then the staple cartridge is attached to the stapler.
For information on how to load staplers, refer to the user's guide

| $[1]$ | Staple cartridge | $[2]$ | Clincher staple arm |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper bunch | $[4]$ | Staple sheet (staple) |
| $[5]$ | Stapler | $[6]$ | Stapler motor |

## (2) Staple empty detection mechanism

- The stapler includes the self-priming sensor and staple empty sensor to detect the status of the staple cartridge and staples.
- The staple cartridge is loaded with staple sheets, and a staple sheet is conveyed to the clinch position (staple position) from the lowest one.
State where staple sheets are loaded

[1] Staple cartridge (loaded with staple sheets)
[2] Staple sheet fed from the cartridge
[3] Self-priming sensor (blocked)
[4] Staple empty sensor (unblocked)
- While the staple cartridge is loaded, if the trailing edge of the last staple sheet in the cartridge passes the actuator of the staple empty sensor, the actuator is raised by the spring force.
- When the actuator is raised, the staple empty sensor is blocked and machine determines that the cartridge is empty. The control panel displays the staple empty message.
State where the last staple sheet is fed

[1] Staple cartridge (staple empty)
[2] Staple sheet (remainder)
[3] Self-priming sensor (blocked)
[4] Staple empty sensor (blocked)

State where staple sheet runs out

[1] Staple cartridge (empty)
[2] Self-priming sensor (unblocked)
[3] Staple empty sensor (blocked)

- Even when the staple empty sensor detects the trailing edge of the last staple sheet, the staple sheet (staples: about 20) fed from the cartridge remains at the cartridge's front section. In this case, the actuator of the self-priming sensor is pressed down by the leading edge of the staple sheet.
- If the actuator is pressed down, the self-priming sensor is blocked and machine determines that the staple sheet is fed to the clinch position (staple position).
- Even when staple empty is detected, printing is not disabled. Paper is discharged without being stapled.
- After staple empty is detected, when the staple cartridge is loaded with staple sheets and the stapler is loaded with the cartridge, the actuator of the staple empty sensor is pressed down by the staple sheets.
- When the actuator is pressed down, the staple empty sensor is unblocked and staple empty condition is cleared. At this point, the staple empty sensor detects the staple sheets (unblocked). However, if the leading edge of the staple sheet cannot be detected by the selfpriming sensor (unblocked), the clinch operation is repeated up to 20 times to feed the leading edge of the staple sheet to the position (clinch position) where it can be detected by the self-priming sensor.
State where staple sheet is not fed

[1] Staple cartridge (loaded with staple sheets)
[2] Staple sheet is fed by clinch operation
[3] Self-priming sensor (unblocked)
[4] Staple empty sensor (unblocked)
- If the self-priming sensor cannot detect the leading edge of the staple sheet after clinch operations, machine determines that the staple sheet is not properly fed (staple sheet is not properly set) and the control panel displays the staple empty message.
- If the staple empty message appears even after staple sheets are loaded, check whether the staple sheets is properly set in the staple cartridge. If the cartridge is clogged with a staple sheet, clear the sheet.
- If staple empty occurs, the stapler stays at the staple cartridge replacement position. (position where staples can be supplied only by opening the front door).
(a) When the staple cartridge is not loaded

| $[1]$ | Staple cartridge (not mounted) | $[2]$ |
| :--- | :--- | :--- |
| $[3]$ | Staple empty sensor (blocked) | - |

- The actuator of the staple empty sensor is raised by the spring force. The staple empty sensor is blocked.
- The actuator of the self-priming sensor is raised by the spring force. The self-priming sensor is unblocked
- MFP determines that the cartridge is empty and the control panel displays the staple empty message.

### 9.2.4 Clogged staple detection control

- Stapling operation is performed by lowering of the clincher staple arm and lifting of the staple arm.
- The staple arm position is detected by the staple home sensor located in the stapler.
- The stapler determines that the stapling operation is completed if the staple arm returns to the home position within the specified time after the stapling operation. If the staple arm does not return to the home position after the specified time has passed, the machine determines that staple trouble has occurred and an error message appears on the control panel.

## 10. RECEIVING SECTION

### 10.1 Configuration

### 10.1.1 Configuration outline

- In the receiving section, paper transported into the finisher is placed into each tray.

Overall: Front perspective view

| $[1]$ | 3rd tray (RU section upper position) | $[2]$ | Sub tray |
| :--- | :--- | :--- | :--- |
| $[3]$ | Main tray | $[4]$ | Saddle tray: FS-534SD only |

## (1) Main tray

- Stores paper that is aligned in the alignment section.
- The tray's up/down mechanism moves the tray down depending on the amount of paper loaded, so that a large capacity of paper can be placed. The tray also includes the mechanism for detecting the amount of loaded paper.
- The paper stacking capacity for trays is different between the FS-534 and FS-534SD. NOTE
- For details on the paper stacking capacity, refer to Paper process ability .

## (2) Sub tray

- Stores paper that is transported from the transport section without passing through the alignment section.
- The tray is a fixed type without the up/down mechanism. The tray includes the mechanism for detecting the amount of loaded paper. NOTE
- For details on the paper stacking capacity, refer to Sub tray.
(3) 3rd tray
- It stores the paper that is transported from the MFP paper exit section.
- The upper part of the RU section door can be used as the exit tray. The tray includes the mechanism for detecting the amount of loaded paper.
NOTE
- For details on the paper stacking capacity, refer to 3rd tray.

## (4) Saddle tray

## NOTE

- FS-534SD only
- Stores paper that is center-stapled in the saddle section is placed in the tray.
- The tray is a fixed type without the up/down mechanism. The tray does not have the sensor for detecting the amount of loaded paper (To detect paper full, the number of sets discharged to the tray is counted.)

NOTE

- For details on the amount of loaded paper, refer to Saddle stitching/folding.
10.1.2 Main tray

Main tray section: Front perspective view

- *1: FS-534SD
- *2: FS-534
(1) Mechanism for protecting main tray drive section

## $\triangle$ CAUTION

- When the drive connection in the torque limiter is released, the main tray moves down under its own weight.
- To avoid finisher breakage and your injury, before releasing the drive connection in the torque limiter, be sure to support the main tray with your hand.
- The drive connection section of the main tray up/down drive mechanism has a torque limiter to prevent breakage.
- There may be an obstacle below the main tray during its downward movement. If the tray touches the obstacle and the force required to stop the lowering operation exceeds the specified value, the teeth of the drive gear rotates in the reverse direction and the driving force cannot be transmitted to the main tray. The torque limiter is used to prevent this situation from causing the breakage of the main tray drive mechanism and the main tray up/down motor.
- The main tray can be moved only upward with your hands. By manually pushing it upward with the force exceeding the specified value, the main tray can be raised. In contrast, as the torque limiter is not provided for the downward movement, the main tray cannot be lowered by pushing it down. If the tray is forcibly pushed downward, the main tray drive mechanism can be damaged
- If the main tray needs to be manually lowered for maintenance and repair, the tray can be lowered by releasing the drive connection in the torque limiter.

Front perspective view

| [1] | Main tray driving shaft | $[2]$ | Main tray up/down motor drive connecting gear |
| :--- | :--- | :--- | :--- |
| $[3]$ | Torque limiter | - | - |

(a) Method for releasing the drive connection
. Remove the rear cover.
Support the main tray with your hand so that it does not fall down.
Slide the area of the torque limiter, located on the main tray driving shaft, as shown to the front side of the main body. The connection of the drive gears is released and the main tray is lowered.
Side view

| $[1]$ | Main tray driving shaft | [2] | Main tray up/down motor drive connecting gear |
| :--- | :--- | :--- | :--- |
| $[3]$ | Torque limiter | - | - |

10.2.2 Sub tray section

NOTE

- For information on the drive in the sub tray (between transport section and sub tray section), refer to PJ.7.2 Drive in the transport section.

### 10.2.3 3re tray section

## NOTE

- The 3rd tray does not have drive parts which requires drives source such as drive motor.

### 10.2.4 Saddle tray section <br> NOTE

- For information on the drive in the sub tray (between transport section and sub tray section), refer to PJ.11.7.1 Drive in the transport section.

### 10.3 Operation

### 10.3.1 Sub tray exit mechanism

- Paper transported from the RU section is discharged to the sub tray by the sub tray exit roller via the FNS paper feed roller, FNS transport roller, and sub tray vertical transport roller.
- To transport paper to the sub tray, the paper path switching gate also operates.
- The sub tray exit roller is driven by the FNS discharge motor.

| $[1]$ | FNS entry transport motor (M2) | $[2]$ | FNS discharge motor (M3) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Sub tray full detection sensor/out (PS9) | $[4]$ | Sub tray section exit roller |
| $[5]$ | Paper | $[6]$ | Sub tray |
| $[7]$ | Upper cover open/close detection sensor (PS32) | $[8]$ | Sub tray full detection sensor/in (PS10) |
| $[9]$ | Sub tray exit sensor (PS8) | - | - |

### 10.3.2 Main tray paper level detection control

- The height of paper stacked on the main tray is always controlled to the specified level, by lowering the main tray depending on the amount of paper discharged to the main tray.
- The paper level is detected by the main tray upper position sensors/Fr and /Rr. Based on the detection results, the main tray height is controlled.
- The top end of the paper detection lever is lifted when the paper detection lever drive gear makes a half-turn. When the paper receiving control motor makes another half-turn, the end of the lever presses down the top of the trailing edge of the paper stacked on the main tray. Depending on the number of the sheets stacked or the height of the exit tray, the position of the paper detection lever changes.
- When the paper detection lever is at the home position, the main tray upper position sensor is unblocked. When the top end of the lever is lifted, the main tray upper position sensor is blocked. If the amount of stacked paper increases while the end of the lever presses down the top of the trailing edge of the paper stacked on the main tray, the paper detection lever becomes unable to return to the home position and the main tray upper position sensor is blocked. This causes machine to determine that the height of stacked paper exceeds the specified height. In this case, the main tray up/down motor is rotated and the main tray is lowered until the main tray upper position sensor is unblocked. When the main tray is lowered to the main tray full detection sensor, MFP determines that the main tray is full and the control panel displays the main tray full message.
- When main tray full is detected, the control panel displays the warning message. In this state, any main tray related configurations and jobs that use the main tray cannot be performed. The warning screen is cleared by removing the paper on the main tray. By removing the paper from the main tray, the paper detection lever is lowered. This causes machine to determine that the paper is removed and the "main tray full" message disappears.
- When the paper detection lever drive gear makes a turn, paper receiving control motor stops. The position of the paper detection lever drive gear is detected by the paper delivery control sensor.
- The paper level detection control is performed each time when paper is discharged to the tray to always monitor the height of paper. This control also serves as the function of preventing paper stacked on the tray from being disturbed by the paper discharged next.

## Front view

| $[3]$ | Main tray (main tray full position)*1 | $[4]$ | Main tray (main tray full position) *2 |
| $[5]$ | Saddle tray | $[6]$ | Main tray full detection sensor (PS29) *2 |
| $[7]$ | Main tray full detection sensor (PS29)*1 | - | - |

- *1: FS-534SD
- *2: FS-534
(3) Amount of paper placed on the main tray
- The amount of paper placed on the main tray is different depending on the mode.
- When either the number or height of stacked sheets reaches the specified value, the main tray full is detected.
(a) Amount of paper placed on the main tray in sort or group mode
- For details on the paper stacking capacity, refer to Number of stacked sheets.
(b) Amount of paper placed on the main tray in sort offset or group offset mode
- For details on the paper stacking capacity, refer to Number of stacked sheets.
(c) Amount of paper placed on the main tray in staple mode
- For details on the paper stacking capacity, refer to Paper capacity.

### 10.3.3 Main tray upper detection mechanism

- The main tray includes the upper limit detection mechanism. The mechanism is to avoid malfunction and breakage of the main tray up/ down mechanism that may be caused by the tray being lifted higher than the specified position.
- While paper is stacked on the main tray, if the main tray moves up and the top of the stack pushes the alignment plate up, the main tray upper position detect switch cover is raised and the main tray upper position detect switch is pressed. This causes the main tray up/down motor to stop rotating and the main tray to stop moving upward.
NOTE
- In the case of small paper of which width is shorter than the distance formed between the alignment plates when the alignments are at home position, the paper may directly pushes up the main tray upper position detect switch cover. In that case, the main tray upward movement is also stopped.
- While the main tray is moving upward, if user press the main tray upper position detect switch cover by mistake, the main tray upward movement is also stopped. In this case, when the main tray upper position detect switch cover is released, if the top surface of the main tray does not reach the specified height, the main tray moves up again. When the top surface of the main tray reaches the specified height, the upward operation stops.
- For details of the main tray up/down operation, refer to PJ.10.3.2 Main tray paper level detection control .

### 10.3.4 Tray full detection mechanism

## (1) Main tray

- When machine determines that the amount of paper stacked on the main tray exceeds the specified height, the paper detection lever causes the main tray up/down motor to rotate to lower the main tray to the specified position. When the main tray is lowered to the position of the main tray full detection sensor, the main tray full is determined.
- When paper full is detected, the warning message appears on the control panel. In this state, any main tray related configurations and jobs that use the main tray cannot be performed. The warning screen is cleared by removing paper from the main tray. For details of main tray up/down control, refer to PF.10.3.2 Main tray paper level detection control.

| $[1]$ | Sub tray | $[2]$ | Main tray (home position) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Main tray (main tray full position)*1 | $[4]$ | Main tray (main tray full position) *2 |
| $[5]$ | Saddle tray | $[6]$ | Main tray full detection sensor (PS29) *2 |
| $[7]$ | Main tray full detection sensor (PS29)*1 | - | - |

- *1: FS-534SD
(2) Sub tray
- When the specified amount of paper is discharged into the sub tray, the stacked paper blocks the sub tray full detection sensor. The sensor detects it as a full state of the exit tray.
- When the sub tray full is detected, the warning message appears on the control panel. In this state, any sub tray related configurations and jobs that use the sub tray cannot be performed. The warning screen can be cleared by removing the paper on the sub tray.

## Front view

| $[1]$ | Sub tray paper transport route | $[2]$ | Sub tray section exit roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | • Sub tray full detection sensor/out (PS9) <br> $\cdot$ Sub tray full detection sensor/in (PS10) | $[4]$ | Paper |
| $[5]$ | Sub tray | $[6]$ | Sub tray exit sensor (PS8) |

## (3) 3rd tray

- When the specified amount of paper is discharged into the 3rd tray, the stacked paper pushes up the 3rd tray full detection sensor actuator. When the actuator is pushed up to the predetermined position, the 3rd exit tray full sensor will be unblocked by the actuator to detect the exit tray full.
- The warning message will be displayed on the control panel when the 3rd tray full is detected. All setting operations and jobs will be disabled when the warning message is displayed on the screen. The warning message will be released by removing the paper on the 3rd tray.

| $[1]$ | 3rd exit tray full sensor (PS1) | $[2]$ | 3rd exit tray full sensor actuator (no paper) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper | $[4]$ | 3rd exit tray full sensor actuator (exit tray full) |

## (4) Saddle tray

## NOTE

- FS-534SD only
- When paper is discharged to the saddle tray, the light from the saddle tray exit sensor is blocked. When the stacked sheets are removed, the sensor light is unblocked
- When the specified amount of paper is discharged into the saddle tray, the stacked paper blocks the saddle tray exit sensor. The sensor detects it as a full state of the saddle tray.
NOTE
- For a tri-fold job, if paper is present in the saddle tray when the job is started, the saddle tray full is detected. (Even only one set of sheets remains, tray full is detected.)
- When the saddle tray full is detected, the warning message appears on the control panel. In this state, any saddle unit related configurations and jobs that use the saddle unit cannot be performed. The warning screen is cleared by removing the paper placed on the saddle unit.

## 11. SADDLE SECTION

### 11.1 Configuration

## NOTE

- FS-534SD only

Front left side perspective view

| :--- | :--- | :--- | :--- |
| $[3]$ | Paper discharge control motor (M2) | $[4]$ | Curl cover |
| $[5]$ | SD transport roller | $[6]$ | SD entrance sensor (PS1) |
| $[7]$ | FNS discharge motor (M3) | - | - |

### 11.2.2 Paper transport

- The FNS discharge motor rotates reversely to transport the paper from the finisher transport section into the saddle unit.
- The paper then is transported to the alignment section by SD transport roller.
- The SD transport roller rotates when the SD transport motor is driven.

### 11.2.3 Curl cover

- The paper is transported to the alignment section one-by-one. A paper which is curled may cause paper misfeed at the entrance of the saddle stitcher.
- In order to prevent this paper misfeed, the curl cover is installed so that each paper is transported to the alignment section without fail.
- The curl cover is operated by the paper discharge control motor. Paper receiving opens/closes the feeding port inside the saddle unit entrance when the paper discharge control motor rotates in forward/reverse direction.

| $[1]$ | SD transport motor (M1) | $[2]$ | Curl cover detection sensor (PS2) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper discharge control motor (M2) | $[4]$ | Curl cover |

| $[5]$ | Stopper drive motor (M4) | $[6]$ | Paper grip |
| $[7]$ | Center folding section lower paddle | $[8]$ | Alignment plate/R |

### 11.3.2 Alignment

- It aligns the paper transported to the alignment section.
- The paper CD alignment is conducted by alignment plate/F and alignment plate/R. The alignment plate shifts by forward/reverse rotation of the alignment motor to align the paper edge.
- The paper FD alignment is conducted by the stopper guide, center folding section upper paddle and center folding section lower paddle.
- The stopper guide moves up when the stopper drive motor rotates in forward/reverse direction to stop at the position which suits the length of the paper transported. The leading edge of the paper stops by the stopper guide to align the leading edge.
- When the paper is transported, the stopper drive motor rotates in forward/reverse direction to operate the stopper guide drive belt, and moves the stopper guide up/down.
- The center folding section upper paddle and the center folding section lower paddle are installed in order to receive the transported paper to the alignment section without fail.
- The paddle is driven by the SD paddle motor.

| $[1]$ | Center staple/fold stacker paper detect sensor (PS3) | $[2]$ | Alignment home sensor (PS4) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Alignment plate/F | $[4]$ | SD paddle motor (M7) |
| $[5]$ | Stopper guide | $[6]$ | Stopper drive motor (M4) |
| $[7]$ | Stopper guide drive belt | $[8]$ | Center folding section lower paddle |
| $[9]$ | Alignment motor (M3) | $[10]$ | Alignment plate/R |
| $[11]$ | Center folding section upper paddle | - | - |

## (1) Alignment operation

- When the saddle exit sensor of the finisher detects the leading edge of the paper, the alignment motor starts rotating in the direction to close the alignment plate, and the alignment plate/F and the alignment plate/R stop at the position where it is slightly wider than the paper width.
- When the specified period of time has passed after the SD entrance sensor detects the trailing edge of the paper, the alignment motor rotates in forward/reverse direction to do oscillation of the alignment plate to align paper.
- The oscillation of the alignment plate is conducted each time a sheet of paper is transported, and the alignment plate is shifted to the standby position after the alignment operation is finished.
- The home position of the alignment plate is detected by the alignment home sensor.

## (2) Stopper guide operation

- The stopper guide is moved up according to the paper size.
- The stopper guide moves up and stops at the specified position after the leading edge of the paper passes the main tray exit sensor.
(3) Paddle operation
- The up/down paddle is driven by the SD paddle motor. The up/down paddle is driven when the specified period of time has passed after the leading edge of the paper passed the saddle exit sensor of the finisher.
- The up/down paddle stops after the paper trailing edge passes the finisher's main tray exit sensor and the paddle rotates for the specified number of times

### 11.3.3 Stopper guide

- At the stopper guide, paper is aligned in the FD direction. Paper conveyed to the aligning section is conveyed to the specified position.
- The exit grip holds the paper when shifting it to the specified position and when stapling papers.
- The alignment section, staple position and other positions (center folding, saddle folding, tri-folding) have their own up/down stop positions. They are controlled by the pulse number of the stopper drive motor.

## (1) Stopper operation

- The stopper drive motor moves the stopper guide up and down in accordance with the paper size. The stopper home sensor detects the home position.

| $[1]$ | Stopper guide | $[2]$ | Exit grip/Fr |
| :--- | :--- | :--- | :--- |
| $[3]$ | Stopper drive motor (M4) | $[4]$ | Stopper home sensor (PS6) |
| $[5]$ | Exit grip/Rr | - | - |

(2) Stopper control

| $[1]$ | Center folding knife assy | $[2]$ | Stopper guide |
| :--- | :--- | :--- | :--- |
| $[3]$ | Exit grip/Fr | $[4]$ | Exit grip/Rr |
| $[5]$ | Center folding roller/2 | $[6]$ | Center folding roller/1 |

(a) Folding mode

- After a specified period of time since the last sheet of paper was aligned, the stopper solenoid is turned ON and the sheets of paper are held in place.
- After the sheets are held in place, the stopper drive motor rotates to move the stopper guide down and lower the sheets to the folding position.
(b) Saddle stitching mode
- After a specified period of time since the last sheet of paper was aligned, the stopper solenoid is turned ON and the sheets of paper are held in place.
- After the sheets are held in place, the stopper drive motor rotates to move the stopper guide down and lower the sheets to the saddle stitching position.
- After a specified period of time since stapling operation was completed, the alignment motor opens the alignment plates and the stopper drive motor starts rotating to move the stopper guide further down and lower the paper to the folding position.

## (c) Tri-folding mode

- After a specified period of time since the last sheet of paper was aligned, the stopper solenoid is turned ON and the sheets of paper are held in place.
- After the sheets are held in place, the stopper drive motor rotates to move the stopper guide down and lower the sheets to the 1 st folding position in the tri-folding.

### 11.4 Stapler

11.4.1 Drive

[1] Stapler unit $\quad$ [2] Stopper drive motor (M4)

| $[3]$ | Stopper home sensor (PS6) | $[4]$ | Stopper guide |
| :--- | :--- | :--- | :--- |
| $[5]$ | Alignment tray | - | - |

### 11.4.2 Operation

- The stapling operation is performed by the stapler motor.

## (1) Stapling operation

- The stapling operation is performed by the staple motor in the stapler.
- The drive gear pushes out the pressed portion of the paper toward the clincher to hold the paper, and then the pin will be pushed out.
- When the pin penetrates the paper batch, the pin will be bent to staple the paper batch at the clincher section.

| $[1]$ | Clincher | $[2]$ | Drive gear |
| :--- | :--- | :--- | :--- |
| $[3]$ | Stapler motor | $[4]$ | Staple |
| $[5]$ | Stapler | - | - |

(2) Staple control

| $[1]$ | Staple unit | [2] | Staple cartridge (Front side): Removed |
| :--- | :--- | :--- | :--- |
| $[3]$ | Staple cartridge (Rear side): Installed | - | - |

## (a) Stapling

- After completing the alignment operation of the alignment plate, the staple motor performs the stapling operation.
- The stapling operation is completed when the stapler home position sensor (rear) detects the home position and turn ON.

## (b) Clogged staple detection

- When the stapler home position sensor (rear) does not turn ON after the specified period of time after it turned OFF during stapling, it is determined that the staple motor has the trouble, and stops the stapler motor.

## (c) Staple cartridge detection

- The staple cartridge switch detects the presence of a cartridge or the incorrect settings of a staple cartridge.
- When no staple cartridge is installed or it is installed incorrectly, an error message appears on the machine control panel.
(d) Staple detection control
- When the staple goes empty, the staple empty switch turns ON and a message appears on the machine control panel.

### 11.5 Folding/Saddle stitching

11.5.1 Drive

| $[1]$ | Tri-folding guide motor (M6) | $[2]$ | Tri-folding roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Center fold knife motor (M9) | $[4]$ | Center fold roller motor (M5) |
| $[5]$ | Saddle section exit roller | - | - |

| $[1]$ | Center folding roller/1 | $[2]$ | Center folding roller/2 |
| :--- | :--- | :--- | :--- |
| $[3]$ | Center fold knife home sensor (PS8) | $[4]$ | Fold drive gear/Rr |
| $[5]$ | Center fold knife motor (M9) | $[6]$ | Center folding knife assy |
| $[7]$ | Fold drive gear/Fr | $[8]$ | Tri-folding guide motor (M6) |

### 11.5.2 Folding knife

- The center fold knife motor drives the folding knife.
- The folding knife is used in the folding/saddle stitching/tri-folding mode
- In the tri-folding mode, it is used at the 1st folding.

## (1) Folding knife operation

- The center fold knife motor rotates the crank shaft a half turn via the gear, and pushes the paper to the nip section with the folding knife.
- The folding rollers draw and fold the paper.
- The position of the stopper guide controls the folding position.

| $[1]$ | Before folding | $[2]$ | Folding knife |
| :--- | :--- | :--- | :--- |
| $[3]$ | Center fold knife home sensor (PS8) | $[4]$ | Center folding roller/2 |
| $[5]$ | Center folding roller/1 | $[6]$ | Folding operation |
| $[7]$ | Crank shaft/Rr | $[8]$ | Fold knife assy drive gear/Rr |
| $[9]$ | Fold knife assy drive gear/Fr | $[10]$ | Crank shaft//Fr |

## (2) Folding knife control

- The center fold knife motor turns ON and sticks out the folding knife to the paper after a specified period of time since the stopper guide stops at the folding position.
- The center fold knife motor stops when the folding knife reciprocates after fold operation is completed and the center fold knife home sensor turns OFF.

### 11.6 Tri-folding

11.6.1 Drive

| $[1]$ | Tri-folding knife assy | $[2]$ | Center fold guide motor (M8) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Guide home sensor (PS7) | $[4]$ | Tri-fold guide motor (M6) |
| $[5]$ | Tri-folding gate home sensor (PS11) | $[6]$ | Center folding change gate |
| $[7]$ | Tri-folding roller | $[8]$ | Fold exit sensor (PS12) |
| $[9]$ | Tri-folding knife | - | - |

### 11.6.2 Tri-folding operation

1. When the center fold guide motor drives, the tri-folding gate rotates. The leading edge of the paper to which the first fold was applied at the center folding section, will be transported to the tri-folding path.
2. When the tri-folding guide motor drives, the tri-folding knife assy drive gear rotates to move down the tri-folding knife assy. The paper to which the first fold is applied at the center folding section will be pushed out to the tri-folding roller.
3. The paper is pulled into the tri-folding roller to tri-fold the paper.
4. When tri-folding is finished, the tri-folding gate will return to the home position. The home position of the tri-folding gate is detected by the tri-folding gate home sensor.

| $[1]$ | Tri-folding knife assy | $[2]$ | Tri-folding knife assy drive gear |
| :--- | :--- | :--- | :--- |
| $[3]$ | Center folding roller/1 | $[4]$ | Paper |
| $[5]$ | Center folding roller/2 | $[6]$ | Tri-folding roll |
| $[7]$ | Tri-folding roller | $[8]$ | Tri-folding gate |
| $[9]$ | Tri-folding knife | - | - |

### 11.7 Exit section

11.7.1 Drive

| $[1]$ | Center fold guide motor (M8) | $[2]$ | Tri-fold guide motor (M6) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Tri-folding gate home sensor (PS11) | $[4]$ | Center folding roller/2 |
| $[5]$ | Center folding roller/1 | $[6]$ | Fold exit sensor (PS12) |
| $[7]$ | Booklet tray empty detection sensor/in (PS13) | $[8]$ | Center fold roller motor (M5) |
| $[9]$ | Booklet tray empty detection sensor/out (PS14) | $[10]$ | Paper press |
| $[11]$ | Saddle tray | $[12]$ | Tri-folding roller |
| $[13]$ | Saddle section exit roller | $[14]$ | Guide home sensor (PS7) |

### 11.7.2 Paper exit

- Center folded, saddle stitched, or tri-folded paper is discharged to the saddle tray.
- The paper that is center folded and saddle folded is sent though the upper route, and the tri-folded paper is sent through the lower route to be discharged.
- The paper is discharged by driving the exit roller and the tri-fold roller. Both rollers are driven by the center fold roller motor.

## (1) Paper exit for center fold / saddle stitch

- The center fold roller motor is driven after the center fold or the saddle stitch, and discharges the paper to the saddle tray by the paper exit roller.

| $[1]$ | Center folding roller/1 | $[2]$ | Fold exit sensor (PS12) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Booklet tray empty detection sensor/in (PS13) | $[4]$ | Paper press |
| $[5]$ | Paper transport route | $[6]$ | Saddle tray |
| $[7]$ | Booklet tray empty detection sensor/out (PS14) | $[8]$ | Saddle section exit roller |
| $[9]$ | Tri-folding roller | $[10]$ | Center folding roller/2 |
| $[11]$ | Folding knife | - | - |

## (2) Paper exit for tri-folding

- Since the paper is tri-folded by the tri-folding roller, the paper is transported through the lower route.

| $[1]$ | Center folding roller/1 | $[2]$ | Tri-folding knife |
| :--- | :--- | :--- | :--- |
| $[3]$ | Fold exit sensor (PS12) | $[4]$ | Booklet tray empty detection sensor/in (PS13) |
| $[5]$ | Paper press | $[6]$ | Paper transport route |
| $[7]$ | Saddle tray | $[8]$ | Booklet tray empty detection sensor/out (PS14) |

| $[9]$ | Saddle section exit roller | $[10]$ | Tri-folding roller |
| :--- | :--- | :--- | :--- |
| $[11]$ | Center folding roller/2 | $[12]$ | Folding knife |

## PK THEORY OF OPERATION FS-536/FS-536SD/PK-520/RU-513

## 1. CONFIGURATION

### 1.1 Section configuration

- FS-536 is composed of the horizontal transport section, transport section, alignment section, output tray section and stapler section.
- The FS-536SD is the model of a finisher that the saddle section is added to FS-536
- Installation of the optional PK-520 enables you to add punch function.

| $[1]$ | Transport section | $[2]$ | Horizontal transport section |
| :--- | :--- | :--- | :--- |
| $[3]$ | Punch section (When PK-520 is installed) | $[4]$ | Stapler section |
| $[5]$ | Saddle section (FS-536SD only) | $[6]$ | Saddle tray section (FS-536SD only) |
| $[7]$ | Alignment section | $[8]$ | Output tray section |

## 2. PAPER PATH

### 2.1 Paper path (FS-536SD/PK-520)

| $[1]$ | Sub tray exit roller, roll | $[2]$ | Sub tray transport roller, roll |
| :--- | :--- | :--- | :--- |

| $[11]$ | Tri-folding roller, roll | $[12]$ | Sub tray exit roller, roll |
| $[13]$ | Receiving roller, Receiving roll | - | - |

- *: Option

## 3. RU-513

### 3.1 Configuration

- The RU section (horizontal transport section) transfers paper that is fed out from the MFP paper exit section to an optional finisher paper feed section.
- The RU door is installed at the upper part of the RU section. Access to the horizontal transport roller is enabled by opening the door upward. To be used for periodical cleaning of the roller and dealing with the paper misfeed at the RU section and other necessary operations.

| $[1]$ | 3rd exit tray full sensor (PS1): Exit section of MFP | $[2]$ | 3rd exit tray full sensor actuator: Exit section of MFP |
| :--- | :--- | :--- | :--- |
| $[3]$ | RU section horizontal transport roller | $[4]$ | RU transport motor (M1) |
| $[5]$ | RU cover open/close detection sensor (PS3) | $[6]$ | RU entrance sensor (PS2) |
| $[7]$ | RU entrance sensor actuator | - | - |

| :--- | :--- | :--- |

$R U$ section door is opened

[2]

| $[1] ~ R U ~ s e c t i o n ~ d o o r ~$ | $[2] \quad$ Horizontal transport section |
| :--- | :--- | :--- |

### 3.2 Drive

- The RU transport motor drives the RU section. It drives three RU section horizontal transport roller.
- The RU section horizontal transport roller is driven using the drive belt.

| $[1]$ | $R U$ section horizontal transport roller1 | $[2]$ | $R U$ section horizontal transport roller2 |
| :--- | :--- | :--- | :--- |
| $[3]$ | $R U$ section horizontal transport roller3 | $[4]$ | $R U$ transport motor (M1) |

### 3.3 Operation

### 3.3.1 Paper transport control

- It transports the paper that is discharged from the lower exit of the MFP paper exit section, to the RU section with the feed guide.
- It transports the paper to the FNS section, using three RU section horizontal transport rollers.
- The RU entrance sensor actuator is installed downstream of the paper path of the RU section horizontal transport roller1, and the RU entrance sensor detects the paper transportation status.

## Perspective view

| $[1]$ | 3rd exit tray full sensor (PS1) | $[2]$ | 3rd exit tray full sensor actuator |
| :--- | :--- | :--- | :--- |
| $[3]$ | RU section horizontal transport roller | $[4]$ | RU transport motor (M1) |

| $[7]$ | RU entrance sensor actuator | - | - |

Front view

### 3.3.2 RU section door open/close detection mechanism

- The RU cover open/close detection sensor installed at the front left of the RU section, detects open/close of the RU door.
- Opening the RU door, the warning screen will display on the control panel. All the setting operations and jobs are disabled while the warning screen is displayed. The printing job is interrupted, and the paper being transported causes paper misfeed. The warning screen can be cancelled by closing the door.

| $[1]$ | $R U$ cover open/close detection sensor (PS3) | - |
| :--- | :--- | :--- |

[1]

[2]

| $[1] \quad \mathrm{RU}$ door | $[2] \quad$ RU cover open/close detection sensor (PS3) |
| :--- | :--- | :--- |

### 3.3.3 3rd exit tray full detection mechanism

- When a predetermined quantity of paper is discharged to the 3rd exit tray, the 3rd exit tray full sensor actuator will be pushed up by the discharged paper. When the actuator is pushed up to the predetermined position, the 3rd exit tray full sensor will be blocked by the actuator to detect the exit tray full.
- The 3rd tray full is detected, the warning screen will display on the control panel. All setting operations and jobs will be disabled when the warning message is displayed on the screen. The warning screen will be released by removing the paper on the 3rd exit tray.

## 4. FINISHER SECTION

### 4.1 Door open/close detection mechanism

### 4.1.1 Front door open/close detection mechanism

- The front door open detect switch installed at the front right of the FNS section detects open/close of the finisher's front door.
- Open the front door, the warning screen will display on the control panel. All the setting operations and jobs are disabled while the warning screen is displayed. The printing job is interrupted, and the paper being transported causes a paper misfeed. The warning screen can be cancelled by closing the door.

| $[1]$ | Front door open detect switch (SW1) | $[2]$ |
| :--- | :--- | :--- |
| $[3]$ | Front door | - |

### 4.1.2 Upper door open/close detection mechanism

- The upper door open/close detection sensor is installed at the front left of the FNS section to detect open/close of the finisher upper door.
- Open the upper door, the warning screen will display on the control panel. All the setting operations and jobs are disabled while the warning screen is displayed. The printing job is interrupted, and the paper being transported causes a paper misfeed. The warning screen can be cancelled by closing the door.

| $[1] \quad$ Upper door open/close detection lever | [2] $\quad$ Upper door open/close detection sensor (PS32) |

| $[7]$ | Saddle exit sensor (PS5) | $[8]$ | Saddle section exit roller |
| $[9]$ | Exchange folded paper output sensor (PS30) | $[10]$ | Receiving roller |
| $[11]$ | Receiving roller retraction motor (M4) | $[12]$ | Receiving roller retraction sensor (PS11) |
| $[13]$ | Main tray exit sensor (PS16) | $[14]$ | Sub tray transport roller |
| $[15]$ | Sub tray exit sensor (PS8) | $[16]$ | Sub tray exit roller |

### 5.2 Drive

| $[1]$ | FNS discharge motor (M3) | $[2]$ | FNS entry transport motor (M2) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Receiving roller | $[4]$ | Paper path switching gate |
| $[5]$ | Transport roller | $[6]$ | FNS entrance roller |
| $[7]$ | Saddle section exit roller | $[8]$ | Receiving roller retraction motor (M4) |
| $[9]$ | Receiving roll | $[10]$ | Sub tray transport roller |
| $[11]$ | Sub tray exit roller | - | - |

### 5.3 Operation

### 5.3.1 Paper path switching mechanism

- Paper path is switched by the up/down operations of the paper path switching gate to transport paper to each tray or the saddle section.
- The up/down operations of the paper path switching gate is driven by the FNS entry transport motor.
- The position of the paper path switching gate is detected by the exchange folded paper output sensor.

| $[1]$ | Sub tray transport roller | $[2]$ | FNS entry transport motor (M2) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Transport roller | $[4]$ | FNS entrance roller |
| $[5]$ | Paper path switching gate | $[6]$ | Lever |
| $[7]$ | Cam | $[8]$ | Detection plate |
| $[9]$ | Exchange folded paper output sensor (PS30) | - | - |

(1) Paper path switching gate up/down operation

- Rotation of the cam raises or lowers the lever to change the position of the paper path switching gate.
- When the paper path switching gate is in the bottom position, paper is transported to the sub tray. When the gate is in the top position, paper is transported to the main tray.
- The detection board that is installed on the same shaft as the cam rotates, which changes the state of the exchange folded paper output sensor. Thus, the position of the paper path switching gate can be determined.
- The paper path switching gate is determined to be in the bottom position when the exchange folded paper output sensor is unblocked. The paper path switching gate is determined to be in the top position when the sensor is blocked.
[1]

[2]

| $[1]$ | Paper exit to the main tray | $[2]$ | Paper exit to the sub tray |
| :--- | :--- | :--- | :--- |
| $[3]$ | Exchange folded paper output sensor (PS30) | $[4]$ | Paper path switching gate |

### 5.3.2 Receiving roller section up/down function

- The up/down movement of the receiving roll, switches the timing of transporting the paper to the alignment section.
- The up/down operations of the receiving roll are driven by the receiving roller retraction motor.
- The position of the receiving roll is detected by the receiving roller retraction sensor.

| $[1]$ | Cam | $[2]$ | Detection plate |
| :--- | :--- | :--- | :--- |
| $[3]$ | Receiving roller retraction motor (M4) | $[4]$ | Receiving roller retraction sensor (PS11) |
| $[5]$ | Receiving roll | $[6]$ | Receiving roller |

## (1) Receiving roller pressure and release

- Rotation of the cam raises or lowers the receiving roll to pressure and release the receiving roller.
- When the receiving roll is pressed against the receiving roller, paper is transported to the alignment section by the receiving roller.
- When the receiving roll is released from the receiving roller, paper is in a standby state along the transport path.
- The detection board that is installed on the same shaft as the cam rotates, which changes the state of the receiving roller retraction sensor. Thus, the position of the receiving roll can be determined.
- The receiving roll is determined to be pressing against the receiving roller when the receiving roller retraction sensor is unblocked. The receiving roll is determined to be in the release state when the sensor is blocked.

### 5.3.3 Buffer control

- The receiving roller section up/down mechanism is provided to achieve high productivity, by eliminating the time loss for the next sheet of paper during the offset and staple operations.
- This allows handling a print job without reducing the paper transport speed even under the condition where the preceding sets of sheets are being aligned and stapled.
- The first sheet of paper that is transported during the paper sheets alignment is switched back toward the saddle exit direction temporarily.
- After paper sheets are aligned and discharged, the first sheet of paper is transported together with the arrived second sheet to the alignment section.
[2]

| $[1]$ | First sheet | $[2]$ | First sheet (switchback) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Sheets (transported to the alignment section) | $[4]$ | Sheets after alignment |
| $[5]$ | First sheet | $[6]$ | Second sheet |

### 5.3.4 Sub tray exit mechanism

- The sub tray exit roller discharges paper from the horizontal transport section to the sub tray passing through the FNS entry roller, transport roller and sub tray transport roller
- To transport paper to the sub tray, the paper path switching gate also operates.
- The sub tray exit roller is driven by the FNS discharge motor.

| $[1]$ | FNS discharge motor (M3) | $[2]$ | FNS entry transport motor (M2) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper path switching gate | $[4]$ | Transport roller |
| $[5]$ | Paper | $[6]$ | Sub tray transport roller |
| $[7]$ | Sub tray exit roller | $[8]$ | Sub tray exit sensor (PS8) |
| $[9]$ | Sub tray | - | - |

## 6. ALIGNMENT SECTION

### 6.1 Configuration

| $[3]$ | Pre-eject away sensor (PS22) | $[4]$ | Trailing edge stopper/C |
| $[5]$ | Pre-eject home sensor (PS21) | $[6]$ | Pre-eject drive motor (M9) |
| $[7]$ | Pre-eject encoder sensor (PS15) | - | - |

(2) Gripper section

| $[1]$ | Paper transport belt | $[2]$ | Gripper home position sensor (PS18) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Gripper position detection sensor (PS19) | $[4]$ | Gripper motor sensor (PS17) |
| $[5]$ | Bundle eject motor (M10) | $[6]$ | Gripper |

### 6.2 Drive

### 6.2.1 Upper paddle section/Alignment tray section

| $[1]$ | Alignment plate/R | $[2]$ | Alignment motor/rear (M8) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Trailing edge stopper | $[4]$ | Trailing edge stopper motor (M6) |
| $[5]$ | Alignment motor/front (M7) | $[6]$ | Alignment plate/F |
| $[7]$ | FNS paddle motor (M5) | $[8]$ | Paper guide |
| $[9]$ | Upper paddle | - | - |

### 6.2.2 Exit section

| $[1]$ | Paper transport belt | $[2]$ | Gripper |
| :--- | :--- | :--- | :--- |
| $[3]$ | Trailing edge stopper/C | $[4]$ | Pre-eject drive motor (M9) |
| $[5]$ | Bundle eject motor (M10) | $[6]$ | Lower paddle |

### 6.3 Operation

### 6.3.1 Paper transport control to alignment section

- When the FNS paddle motor rotates, the upper paddles (3 pieces) located on the upper paddle shaft, rotates to draw and drop the paper to the alignment tray.
- The upper paddle returns to standby at the home position (upper position) after one rotation.
- The cam located on the upper paddle shaft rotates to move the paper guide up and down.
- The lowering of the paper guide ensures that paper is transported to the alignment tray.

| $[1]$ | Cam | $[2]$ | Paper guide |
| :--- | :--- | :--- | :--- |
| $[3]$ | Receiving roller | $[4]$ | Paper |
| $[5]$ | Upper paddle home position detection sensor (PS14) | $[6]$ | Detection plate |
| $[7]$ | FNS paddle motor (M5) | $[8]$ | Upper paddle |

### 6.3.2 Paper alignment control

## (1) Alignment plate

- The alignment plate/F and alignment plate/R align the paper in the width orientation and shift paper sheets.
- The alignment motor and drive belt drives the alignment plates.
- The alignment plates move forward and backward by the forward and reverse rotation of the alignment motor
- Alignment plate/F and alignment plate//R are each equipped with a drive motor, which allows them to operate independently.

| $[1]$ | Alignment plate/R home sensor (PS13) | $[2]$ | Alignment motor/rear (M8) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Alignment motor/front (M7) | $[4]$ | Alignment plate/F home sensor (PS12) |
| $[5]$ | Alignment plate /F: home position | $[6]$ | Alignment plate /R: home position |

(a) Alignment operation

- The alignment motor/front rotates to move the alignment plate/F via the alignment plate/F drive belt.
- The alignment plate/F home sensor detects the home position of the alignment plate/F.
- The alignment motor/rear rotates to move the alignment plate/R via the alignment plate/R drive belt.
- The alignment plate/R home sensor detects the home position of the alignment plate/R.
- The sheets are placed between the alignment plates/F and /R corresponding to the paper width so that their both ends are aligned.

(b) Shift operation
- When offset is selected as finishing option, the alignment plates are moved to shift the sets of paper. Paper is discharged to the center of the main tray at normal printing and stapling.
- Depending on the width of paper, the alignment plate F (alignment plate R ) pushes the sets of paper to the rear side (front side) from one side so that the sets of the paper are shifted.
- The sheets are shifted by alternatively repeating the above operation.

## (2) Trailing edge stopper

- The trailing edge stopper/F and trailing edge stopper/R align paper in the feed orientation.
- The trailing edge stopper motor drives the trailing edge stoppers.

| $[1]$ | Stopper moving shaft | $[2]$ | Trailing edge stopper motor (M6) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Trailing edge stopper home position detection sensor <br> (PS20) | $[4]$ | Trailing edge stopper/F: home position |
| $[5]$ | Trailing edge stopper/R: home position | - | - |

(a) Alignment operation

- The shaft for stopper movement has a different spiral between the front and rear sides.
- The trailing edge stopper/F to move forward and the trailing edge stopper/R to move backward when the trailing edge stopper motor rotates in the normal direction.
- Trailing edge stopper/F and the trailing edge stopper/R shift according to the paper width before starting a job, to hold the trailing edge of the paper.
- Paper is sandwiched between the upper paddle and lower paddle, and pressed against the trailing edge stoppers.
- The trailing edge stoppers hold the trailing edge of the paper, to align the trailing edge of paper in the feed orientation.
- For 2-point staple jobs, the trailing edge stoppers/F and $/ \mathrm{R}$ are retracted to the position where they do not interfere with the stapler.
- After the job is completed, the trailing edge stopper motor reverses the rotation to return the trailing edge stopper to the home position.

| $[1]$ | Upper paddle | $[2]$ | Paper guide |
| :--- | :--- | :--- | :--- |
| $[3]$ | Receiving roll | $[4]$ | Receiving roller |
| $[5]$ | Trailing edge stopper | $[6]$ | Lower paddle |

### 6.3.3 Paper exit control

- When the pre-eject drive motor rotates counterclockwise, the bottom edge stopper/C pushes paper to the position at which it can be gripped by the gripper.
- The gripper grips the trailing edges of the sets of paper in the alignment tray and transports them to the paper exit position.
- The gripper releases the sets of paper to discharge them to the main tray. The gripper is moved to the home position and brought into a standby state.

| $[1]$ | Paper transport belt | $[2]$ | Gripper |
| :--- | :--- | :--- | :--- |
| $[3]$ | Trailing edge stopper/C | $[4]$ | Pre-eject drive motor (M9) |
| $[5]$ | Bundle eject motor (M10) | $[6]$ | Lower paddle |

## (1) Lower paddle operation

- When the pre-eject drive motor rotates clockwise, the lower paddle rotates to press the paper against the trailing edge stopper.
- When the pre-eject drive motor rotates counterclockwise, the trailing edge stopper moves from the home position to the paper exit position to discharge paper to the main tray.
- When the drive gear makes a turn, the stopper moves from the paper exit position to the home position and is brought into a standby state.

| $[1]$ | Lower paddle | $[2]$ | Pre-eject drive motor (M9) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Trailing edge stopper/C | $[4]$ | Pre-eject home sensor (PS21) |
| $[5]$ | Pre-eject away sensor (PS22) | $[6]$ | One-way clutch (for lower paddle driving) |
| $[7]$ | One-way clutch (for trailing edge stopper/C driving) | - | - |

## (2) Gripper operation

- The bundle eject motor rotates to turn the paper transport belt. This causes the gripper, fixed to the paper transport belt, to rotate.
- The gripper stays at the home position (inside the exit section) and rotates at the position [5] shown in the illustration to grip the trailing edge of paper. Paper is transported with the gripper griping the trailing edge of the paper. The gripper releases the paper when it rotates at the position [8] shown in the illustration. After the paper transport belt makes one turn, the gripper returns to the home position and is brought into the standby state.

| $[1]$ | Paper | $[2]$ | Gripper home position sensor (PS18) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Gripper position detection sensor (PS19) | $[4]$ | Gripper (home position) |
| $[5]$ | Gripper position (gripping the paper) | $[6]$ | Bundle eject motor (M10) |
| $[7]$ | Gripper position (transporting the paper) | $[8]$ | Gripper position (release the paper) |

## 7. STAPLER SECTION

### 7.1 Configuration

| $[1]$ | Stapler home position sensor (rear) (PS23) | $[2]$ | Side stapler movement motor (M13) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Wide flat limit sensor (PS36) | $[4]$ | Staple cartridge |
| $[5]$ | Shaft | $[6]$ | Stapler move dial |
| $[7]$ | Stapler position sensor (center) (PS24) | $[8]$ | Stapler unit |

### 7.2 Drive

| $[1]$ | Slide guide plate | $[2]$ | Side stapler movement motor (M13) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Drive belt | $[4]$ | Stapler move dial |
| $[5]$ | Stapler unit | $[6]$ | Shaft |

### 7.3 Operation

### 7.3.1 Stapler movement control

## (1) Stapler Movement

- When the side stapler movement motor rotates, the belt is driven. So, the stapler holder that is attached to the belt moves back and forth along the shaft.
- When the staple unit moves to stapler home position or staple cartridge replacement position, the slide guide plate shape causes the staple unit to rotate.

| $[1]$ | Stapler unit (home position) | $[2]$ | Side stapler movement motor (M13) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Stapler unit (corner staple (parallel) position) | $[4]$ | Stapler unit (2-staple position) |
| $[5]$ | Stapler unit (2-staple position) | $[6]$ | Stapler unit (staple cartridge replacement position) |
| $[7]$ | Slide guide plate | $[8]$ | Shaft |

## (2) Stapler position detection

- The stapler home position sensor (rear) detects the home position of the stapler.
- The stapler staple position is detected depending on the motor rotation amount that is based on the stapler home position sensor (rear) and stapler position sensor (center).
- The wide flat limit sensor detects the corner staple (parallel) position of the stapler.
- The staple cartridge replacement position is detected depending on the amount of side stapler movement motor rotation that is based on the stapler position sensor (center).

| $[1]$ | Stapler home position sensor (rear) (PS23) | $[2]$ | Wide flat limit sensor (PS36) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Actuator | $[4]$ | Stapler position sensor (center) (PS24) |

### 7.3.2 Staple control

| $[1]$ | Staple cartridge | $[2]$ | Clincher staple arm |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper bunch | $[4]$ | Staple sheet (staple) |
| $[5]$ | Stapler | $[6]$ | Stapler motor |

## (1) Stapling operation

- The stapling operation is driven by the stapler motor.
- The clincher staple arm is lowered by the stapler motor. The clincher staple arm presses the sheets.
- Afterwards, a staple is pushed up the staple arm from the staple side. The staple is pressed through the sheets and bent from the clincher staple arm to fasten the sheets together.
- The staple operation completes when the staple arm returns to the home position.

## (2) Clogged staple detection

- The staple arm position is detected by the stapler home sensor located in the stapler.
- The stapler home sensor is off during the staple operation.
- A staple jam is determined when the stapler home sensor does not turn on again after a specified amount of time elapses since it turned off.

### 7.3.3 Staple empty detection control

## (1) Staple empty detection

- The stapler includes the self-priming sensor and staple empty sensor to detect the status of the staple cartridge and staples.
- If the trailing edge of the last staple sheet in the cartridge passes the actuator of the staple empty sensor, the staple empty sensor is blocked and machine determines that the cartridge is empty.
- Even when staple empty is detected, printing is not disabled. Paper is delivered without being stapled.
- If staple empty occurs, the stapler stays at the staple cartridge replacement position.

| $[1]$ | Staple cartridge | $[2]$ | Staple sheet |
| :--- | :--- | :--- | :--- |
| $[3]$ | Self-priming sensor | $[4]$ | Staple empty sensor |

## (2) Cartridge installation detection

- When a cartridge is not installed, the staple empty sensor is blocked and the self-priming sensor is unblocked.
- The control panel displays to warn of the staple empty message.

| $[1]$ | Staple cartridge (not mounted) | $[2]$ | Self-priming sensor (unblocked) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Staple empty sensor (blocked) | - | - |

## (3) Staple sheet setting errors

- When a staple sheet is placed, the staple empty sensor is unblocked, and the empty-staple status clears.
- When the staple empty sensor is detecting (unblocked), but the self-priming sensor (unblocked) cannot detect the edge of the staple sheet, the clinch operation is performed.
- If the self-priming sensor cannot detect the leading edge of the staple sheet after clinch operations, machine determines that the staple sheet is not properly fed and the control panel displays the staple empty message.

| $[1]$ | Staple cartridge (loaded with staple sheets) | $[2]$ | Staple sheet is fed by clinch operation |
| :--- | :--- | :--- | :--- |
| $[3]$ | Self-priming sensor (unblocked) | $[4]$ | Staple empty sensor (unblocked) |

## 8. OUTPUT TRAY SECTION

### 8.1 Configuration

- *2: Installation position for the FS-536 sensor
- *3: FS-536SD only

### 8.2 Drive

| $[1]$ | Main tray | $[2]$ | Main tray up/down motor (M11) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Main tray drive belt/R | $[4]$ | Paper receiving control motor (M12) |
| $[5]$ | Main tray drive belt/F | $[6]$ | Paper detection lever/F |
| $[7]$ | Paper detection lever/R | - | - |

### 8.3 Operation

### 8.3.1 Main tray up/down mechanism

- Rotation of the main tray up/down motor drives the main tray drive belt to lift and lower the main tray

| $[1]$ | Main tray up/down motor (M11) | $[2]$ | Main tray drive belt |
| :--- | :--- | :--- | :--- |
| $[3]$ | Main tray full detection sensor (PS29) | $[4]$ | Main tray (main tray full position) |
| $[5]$ | Main tray (home position) | $[6]$ | Sub tray |

(1) Mechanism for protecting main tray drive section

## $\triangle$ CAUTION

- When the drive connection in the torque limiter is released, the main tray moves down under its own weight.
- To avoid finisher breakage and your injury, before releasing the drive connection in the torque limiter, be sure to support the main tray with your hand.
- The drive connection section of the main tray up/down drive mechanism has a torque limiter to prevent breakage.
- There may be an obstacle below the main tray during its downward movement. If the tray touches the obstacle and the force required to stop the lowering operation exceeds the specified value, the teeth of the drive gear rotates in the reverse direction and the driving force cannot be transmitted to the main tray. The torque limiter is used to prevent this situation from causing the breakage of the main tray drive mechanism and the main tray up/down motor.
- The main tray can be moved only upward with your hands. By manually pushing it upward with the force exceeding the specified value, the main tray can be raised. In contrast, as the torque limiter is not provided for the downward movement, the main tray cannot be lowered by pushing it down. If the tray is forcibly pushed downward, the main tray drive mechanism can be damaged.
- If the main tray needs to be manually lowered for maintenance and repair, the tray can be lowered by releasing the drive connection in the torque limiter.
Front perspective view

| $[3]$ | Torque limiter | - |
| :--- | :--- | :--- |

Method for releasing the drive connection

1. Remove the rear cover.
2. Support the main tray with your hand so that it does not fall down.
3. Slide the area of the torque limiter, located on the main tray driving shaft, as shown to the front side of the main body. The connection of the drive gears is released and the main tray is lowered.
4. Side view

| $[1]$ | Main tray driving shaft | $[2]$ | Main tray up/down motor drive connecting gear |
| :--- | :--- | :--- | :--- |
| $[3]$ | Torque limiter | - | - |

### 8.3.2 Main tray upper detection mechanism

- Upper limit detection mechanism is provided to prevent main tray up/down mechanism malfunction and damage due to lifting the main tray above the specified position.
- When the top surface of paper pushes up the alignment plate during main tray rising, the main tray upper position detect switch cover is pressed. So, the main tray upper position detect switch is pressed.
- It detects that the main tray has reached the upper limit position when the main tray upper position detect switch is pressed.
- When the main tray reaches the upper limit position, main tray up/down motor stops rotating to stop lifting the main tray.

| $[1]$ | Main tray upper position detect switch (SW2) | $[2]$ | Alignment plate |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper | $[4]$ | Main tray |
| $[5]$ | Main tray upper switch cover | - | - |

### 8.3.3 Main tray paper level detection control

- To eliminate irregularity of the discharged paper, distance between the top surface of the discharged paper and the exit port is controlled to be consistent.
- The main tray upper position sensor detects the level of the discharged paper in the main tray.
- The top surface of the discharged paper is controlled to be at specified position by raising/lowering the main tray depending on the detected paper level.
- The paper level is detected every time that the paper is discharged to check the paper height.

## (1) Main tray upper position sensor control

- The paper level detect lever is installed on the main tray and operates with the paper receiving control motor and paper level detect lever drive gear.
- The leading of the paper level detect lever will rise when the paper level detect lever drive gear is rotated half turn. If the paper level detect lever drive gear rotates another half turn, the paper level detect lever will be lowered. This operation will hold down the top surface at the trailing edge of the paper in the main tray.
- The paper delivery control sensor detects the position of the paper level detect lever drive gear. The paper receiving control motor stops when the paper level detect lever drive gear is rotated one turn.
- The main tray upper position sensor detects the position of the leading of the paper level detect lever.
- The position of the main tray upper position sensor changes depending on the paper level detect lever position. Position of the paper level detect lever changes depending on the height of the output tray.
- When the main tray upper position sensor is blocked, the main tray top surface of the paper sheets is determined as exceeding the specified height.
- The main tray up/down motor is rotated and the main tray is lowered until the main tray upper position sensor is unblocked.

| $[1]$ | Paper detection lever (home position) | $[2]$ | Paper detection lever (upper position) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper delivery control sensor (PS28) | $[4]$ | Paper detection lever drive gear |

| $[1]$ | Main tray upper position sensor/F (PS27) <br> Main tray upper position sensor/R (PS26) | [2] | Paper |
| :--- | :--- | :--- | :--- |
| $[3]$ | Main tray | - | - |

### 8.3.4 Tray full detection mechanism

## (1) Main tray

- The main tray is lowered to maintain the paper top surface to specified position when the paper is discharged to the main tray.
- Once the main tray is lowered to the specified position, the actuator is activated to block the main tray full detection sensor.
- When the main tray full detection sensor is blocked, main tray is determined as full and the warning screen is displayed.
- When the main tray full is detected, all configurations and jobs that use the main tray cannot be performed.
- By removing the paper from the main tray, the paper detection lever is lowered. This causes machine to determine that the paper is removed and the "main tray full" message disappears.

| $[1]$ | Main tray (home position) | $[2]$ | Main tray (main tray full position) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Main tray full detection sensor (PS29) | $[4]$ | Actuator |

## (2) Sub tray

- When paper is discharged into the sub tray, the stacked paper blocks the sub tray full detection sensor. This blocked state is interpreted as a detection of a full output tray.
- When the sub tray full is detected, the warning message appears on the control panel.
- In this state, any saddle unit configurations and jobs that use the saddle unit cannot be performed

| $[1]$ | Sub tray full detection sensor/out (PS9) | $[2]$ | Sub tray full detection sensor/in (PS10) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Sub tray | $[4]$ | Paper |

| $[5]$ | Jam removal cover (alignment section) | - | - |

### 9.2 Transport section

### 9.2.1 Drive

| $[1]$ | SD transport motor (M1) | $[2]$ | Curl cover detection sensor (PS2) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper discharge control motor (M2) | $[4]$ | Curl cover |
| $[5]$ | SD transport roller | $[6]$ | SD entrance sensor (PS1) |
| $[7]$ | FNS discharge motor (M3) | - | - |

### 9.2.2 Paper transport

- The FNS discharge motor rotates reversely to transport the paper from the finisher transport section into the saddle unit.
- The paper then is transported to the alignment section by SD transport roller.
- The SD transport roller rotates when the SD transport motor is driven.

### 9.2.3 Curl cover

- The paper is transported to the alignment section one-by-one. A paper which is curled may cause paper misfeed at the entrance of the saddle stitcher.
- In order to prevent this paper misfeed, the curl cover is installed so that each paper is transported to the alignment section without fail.
- The curl cover is operated by the paper discharge control motor. Paper receiving opens/closes the feeding port inside the saddle unit entrance when the paper discharge control motor rotates in forward/reverse direction.

| $[1]$ | SD transport motor (M1) | $[2]$ | Curl cover detection sensor (PS2) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper discharge control motor (M2) | $[4]$ | Curl cover |

[7]

| $[1]$ | SD transport roll | $[2]$ | Curl cover |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper | $[4]$ | SD transport roller |
| $[5]$ | Paper transportation from within the finisher | $[6]$ | Curl cover operation |
| $[7]$ | Next paper standby (moves curl cover to the home <br> position $)$ | - | - |

### 9.3 Alignment section

### 9.3.1 Drive

| $[1]$ | Center folding section upper paddle | $[2]$ | Alignment plate/F |
| :--- | :--- | :--- | :--- |
| $[3]$ | SD paddle motor (M7) | $[4]$ | Stopper guide |
| $[5]$ | Stopper drive motor (M4) | $[6]$ | Paper grip |
| $[7]$ | Center folding section lower paddle | $[8]$ | Alignment plate/R |

### 9.3.2 Alignment

- It aligns the paper transported to the alignment section.
- The paper CD alignment is conducted by alignment plate/F and alignment plate/R. The alignment plate shifts by forward/reverse rotation of the alignment motor to align the paper edge.
- The paper FD alignment is conducted by the stopper guide, center folding section upper paddle and center folding section lower paddle.
- The stopper guide moves up when the stopper drive motor rotates in forward/reverse direction to stop at the position which suits the length of the paper transported. The leading edge of the paper stops by the stopper guide to align the leading edge.
- When the paper is transported, the stopper drive motor rotates in forward/reverse direction to operate the stopper guide drive belt, and moves the stopper guide up/down.
- The center folding section upper paddle and the center folding section lower paddle are installed in order to receive the transported paper to the alignment section without fail.
- The paddle is driven by the SD paddle motor.

| $[1]$ | Center staple/fold stacker paper detect sensor (PS3) | $[2]$ | Alignment home sensor (PS4) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Alignment plate/F | $[4]$ | SD paddle motor (M7) |
| $[5]$ | Stopper guide | $[6]$ | Stopper drive motor (M4) |
| $[7]$ | Stopper guide drive belt | $[8]$ | Center folding section lower paddle |
| $[9]$ | Alignment motor (M3) | $[10]$ | Alignment plate/R |
| $[11]$ | Center folding section upper paddle | - | - |

## (1) Alignment operation

- When the saddle exit sensor of the finisher detects the leading edge of the paper, the alignment motor starts rotating in the direction to close the alignment plate, and the alignment plate/F and the alignment plate/R stop at the position where it is slightly wider than the paper width.
- When the specified period of time has passed after the SD entrance sensor detects the trailing edge of the paper, the alignment motor rotates in forward/reverse direction to do oscillation of the alignment plate to align paper.
- The oscillation of the alignment plate is conducted each time a sheet of paper is transported, and the alignment plate is shifted to the standby position after the alignment operation is finished.
- The home position of the alignment plate is detected by the alignment home sensor.

## (2) Stopper guide operation

- The stopper guide is moved up according to the paper size.
- The stopper guide moves up and stops at the specified position after the leading edge of the paper passes the main tray exit sensor.
(3) Paddle operation
- The up/down paddle is driven by the SD paddle motor. The up/down paddle is driven when the specified period of time has passed after the leading edge of the paper passed the saddle exit sensor of the finisher
- The up/down paddle stops after the paper trailing edge passes the finisher's main tray exit sensor and the paddle rotates for the specified number of times

### 9.3.3 Stopper guide

- At the stopper guide, paper is aligned in the FD direction. Paper conveyed to the aligning section is conveyed to the specified position.
- The exit grip holds the paper when shifting it to the specified position and when stapling papers.
- The alignment section, staple position and other positions (center folding, saddle folding, tri-folding) have their own up/down stop positions. They are controlled by the pulse number of the stopper drive motor.

## (1) Stopper operation

- The stopper drive motor moves the stopper guide up and down in accordance with the paper size. The stopper home sensor detects the home position.

| $[1]$ | Stopper guide | $[2]$ | Exit grip/Fr |
| :--- | :--- | :--- | :--- |
| $[3]$ | Stopper drive motor (M4) | $[4]$ | Stopper home sensor (PS6) |
| $[5]$ | Exit grip/Rr | - | - |

(2) Stopper control

| $[1]$ | Center folding knife assy | $[2]$ | Stopper guide |
| :--- | :--- | :--- | :--- |
| $[3]$ | Exit grip/Fr | $[4]$ | Exit grip/Rr |
| $[5]$ | Center folding roller/2 | $[6]$ | Center folding roller/1 |

(a) Folding mode

- After a specified period of time since the last sheet of paper was aligned, the stopper solenoid is turned ON and the sheets of paper are held in place.
- After the sheets are held in place, the stopper drive motor rotates to move the stopper guide down and lower the sheets to the folding position.
(b) Saddle stitching mode
- After a specified period of time since the last sheet of paper was aligned, the stopper solenoid is turned ON and the sheets of paper are held in place.
- After the sheets are held in place, the stopper drive motor rotates to move the stopper guide down and lower the sheets to the saddle stitching position.
- After a specified period of time since stapling operation was completed, the alignment motor opens the alignment plates and the stopper drive motor starts rotating to move the stopper guide further down and lower the paper to the folding position.

## (c) Tri-folding mode

- After a specified period of time since the last sheet of paper was aligned, the stopper solenoid is turned ON and the sheets of paper are held in place.
- After the sheets are held in place, the stopper drive motor rotates to move the stopper guide down and lower the sheets to the 1 st folding position in the tri-folding.

### 9.4 Stapler

### 9.4.1 Drive

[1] Stapler unit $\quad$ [2] Stopper drive motor (M4)

| $[3]$ | Stopper home sensor (PS6) | $[4]$ | Stopper guide |
| :--- | :--- | :--- | :--- |
| $[5]$ | Alignment tray | - | - |

### 9.4.2 Operation

- The stapling operation is performed by the stapler motor.

## (1) Stapling operation

- The stapling operation is performed by the staple motor in the stapler.
- The drive gear pushes out the pressed portion of the paper toward the clincher to hold the paper, and then the pin will be pushed out.
- When the pin penetrates the paper batch, the pin will be bent to staple the paper batch at the clincher section

| $[1]$ | Clincher | $[2]$ | Drive gear |
| :--- | :--- | :--- | :--- |
| $[3]$ | Stapler motor | $[4]$ | Staple |
| $[5]$ | Stapler | - | - |

(2) Staple control

| $[1]$ | Staple unit | $[2]$ | Staple cartridge (Front side): Removed |
| :--- | :--- | :--- | :--- |
| $[3]$ | Staple cartridge (Rear side): Installed | - | - |

(a) Stapling

- After completing the alignment operation of the alignment plate, the staple motor performs the stapling operation.
- The stapling operation is completed when the stapler home position sensor (rear) detects the home position and turn ON.

## (b) Clogged staple detection

- When the stapler home position sensor (rear) does not turn ON after the specified period of time after it turned OFF during stapling, it is determined that the staple motor has the trouble, and stops the stapler motor.
(c) Staple cartridge detection
- The staple cartridge switch detects the presence of a cartridge or the incorrect settings of a staple cartridge.
- When no staple cartridge is installed or it is installed incorrectly, an error message appears on the machine control panel.
(d) Staple detection control
- When the staple goes empty, the staple empty switch turns ON and a message appears on the machine control panel.

### 9.5 Folding/Saddle stitching

### 9.5.1 Drive

| $[1]$ | Tri-folding guide motor (M6) | $[2]$ | Tri-folding roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Center fold knife motor (M9) | $[4]$ | Center fold roller motor (M5) |
| $[5]$ | Saddle section exit roller | - | - |

| $[1]$ | Center folding roller/1 | $[2]$ | Center folding roller/2 |
| :--- | :--- | :--- | :--- |
| $[3]$ | Center fold knife home sensor (PS8) | $[4]$ | Fold drive gear/Rr |
| $[5]$ | Center fold knife motor (M9) | $[6]$ | Center folding knife assy |
| $[7]$ | Fold drive gear/Fr | $[8]$ | Tri-folding guide motor (M6) |

### 9.5.2 Folding knife

- The center fold knife motor drives the folding knife
- The folding knife is used in the folding/saddle stitching/tri-folding mode.
- In the tri-folding mode, it is used at the 1st folding.

## (1) Folding knife operation

- The center fold knife motor rotates the crank shaft a half turn via the gear, and pushes the paper to the nip section with the folding knife.
- The folding rollers draw and fold the paper.
- The position of the stopper guide controls the folding position.

| $[1]$ | Before folding | $[2]$ | Folding knife |
| :--- | :--- | :--- | :--- |
| $[3]$ | Center fold knife home sensor (PS8) | $[4]$ | Center folding roller/2 |
| $[5]$ | Center folding roller/1 | $[6]$ | Folding operation |
| $[7]$ | Crank shaft/Rr | $[8]$ | Fold knife assy drive gear/Rr |
| $[9]$ | Fold knife assy drive gear/Fr | $[10]$ | Crank shaft/Fr |

## (2) Folding knife control

- The center fold knife motor turns ON and sticks out the folding knife to the paper after a specified period of time since the stopper guide stops at the folding position.
- The center fold knife motor stops when the folding knife reciprocates after fold operation is completed and the center fold knife home sensor turns OFF.

### 9.6 Tri-folding

### 9.6.1 Drive

| $[1]$ | Tri-folding knife assy | $[2]$ | Center fold guide motor (M8) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Guide home sensor (PS7) | $[4]$ | Tri-fold guide motor (M6) |
| $[5]$ | Tri-folding gate home sensor (PS11) | $[6]$ | Center folding change gate |
| $[7]$ | Tri-folding roller | $[8]$ | Fold exit sensor (PS12) |
| $[9]$ | Tri-folding knife | - | - |

### 9.6.2 Tri-folding operation

1. When the center fold guide motor drives, the tri-folding gate rotates. The leading edge of the paper to which the first fold was applied at the center folding section, will be transported to the tri-folding path.
2. When the tri-folding guide motor drives, the tri-folding knife assy drive gear rotates to move down the tri-folding knife assy. The paper to which the first fold is applied at the center folding section will be pushed out to the tri-folding roller.
3. The paper is pulled into the tri-folding roller to tri-fold the paper.
4. When tri-folding is finished, the tri-folding gate will return to the home position. The home position of the tri-folding gate is detected by the tri-folding gate home sensor.

| $[1]$ | Tri-folding knife assy | $[2]$ | Tri-folding knife assy drive gear |
| :--- | :--- | :--- | :--- |
| $[3]$ | Center folding roller/1 | $[4]$ | Paper |
| $[5]$ | Center folding roller/2 | $[6]$ | Tri-folding roll |
| $[7]$ | Tri-folding roller | $[8]$ | Tri-folding gate |
| $[9]$ | Tri-folding knife | - | - |

### 9.7 Exit section

### 9.7.1 Drive

| $[1]$ | Center fold guide motor (M8) | $[2]$ | Tri-fold guide motor (M6) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Tri-folding gate home sensor (PS11) | $[4]$ | Center folding roller/2 |
| $[5]$ | Center folding roller/1 | $[6]$ | Fold exit sensor (PS12) |
| $[7]$ | Booklet tray empty detection sensor/in (PS13) | $[8]$ | Center fold roller motor (M5) |
| $[9]$ | Booklet tray empty detection sensor/out (PS14) | $[10]$ | Paper press |
| $[11]$ | Saddle tray | $[12]$ | Tri-folding roller |
| $[13]$ | Saddle section exit roller | $[14]$ | Guide home sensor (PS7) |

### 9.7.2 Paper exit

- Center folded, saddle stitched, or tri-folded paper is discharged to the saddle tray.
- The paper that is center folded and saddle folded is sent though the upper route, and the tri-folded paper is sent through the lower route to be discharged.
- The paper is discharged by driving the exit roller and the tri-fold roller. Both rollers are driven by the center fold roller motor.

## (1) Paper exit for center fold / saddle stitch

- The center fold roller motor is driven after the center fold or the saddle stitch, and discharges the paper to the saddle tray by the paper exit roller.

| $[1]$ | Center folding roller/1 | $[2]$ | Fold exit sensor (PS12) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Booklet tray empty detection sensor/in (PS13) | $[4]$ | Paper press |
| $[5]$ | Paper transport route | $[6]$ | Saddle tray |
| $[7]$ | Booklet tray empty detection sensor/out (PS14) | $[8]$ | Saddle section exit roller |
| $[9]$ | Tri-folding roller | $[10]$ | Center folding roller/2 |
| $[11]$ | Folding knife | - | - |

## (2) Paper exit for tri-folding

- Since the paper is tri-folded by the tri-folding roller, the paper is transported through the lower route.

| $[1]$ | Center folding roller/1 | $[2]$ | Tri-folding knife |
| :--- | :--- | :--- | :--- |
| $[3]$ | Fold exit sensor (PS12) | $[4]$ | Booklet tray empty detection sensor/in (PS13) |
| $[5]$ | Paper press | $[6]$ | Paper transport route |
| $[7]$ | Saddle tray | $[8]$ | Booklet tray empty detection sensor/out (PS14) |

| $[9]$ | Saddle section exit roller | $[10]$ | Tri-folding roller |
| :--- | :--- | :--- | :--- |
| $[11]$ | Center folding roller/2 | $[12]$ | Folding knife |

### 9.7.3 Tray full detection mechanism

- When paper sheets are discharged to the saddle tray, the light from the saddle tray no paper detection sensor is blocked. When the stacked sheets are removed, the sensor light is unblocked.
- When a predetermined amount of paper is discharged into the saddle tray, the stacked paper blocks the saddle tray no paper detection sensor. The blocked state is determined as a detection of a full saddle tray.

## NOTE

- For a tri-fold job, if paper is present in the saddle tray when the job is started, the saddle tray full is detected. (A tray full detection is made even when only one group of sheets remains.)
- When the saddle tray full is detected, the warning message appears on the control panel.
- In this state, any saddle unit related configurations and jobs that use the saddle unit cannot be performed.

| $[1]$ | Booklet tray empty detection sensor/in (PS13) | $[2]$ | Booklet tray empty detection sensor/out (PS14) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Saddle tray | $[4]$ | Paper |

10. PK-520

### 10.1 Configuration

| $[1]$ | Puncher | $[2]$ | Punch home sensor (PS1) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Punch position sensor (PS2) | $[4]$ | Punch drive motor (M1) |
| $[5]$ | Punch motor sensor (PS3) | $[6]$ | Actuator |
| $[7]$ | Punch dust full sensor/in (PS5) | $[8]$ | Punch dust box |
| $[9]$ | Punch dust full sensor/out (PS4) | - | - |

### 10.2 Drive

| $[1]$ | Puncher drive gear | $[2]$ | Puncher frame 1 |
| :--- | :--- | :--- | :--- |
| $[3]$ | Puncher | $[4]$ | Puncher frame 2 |
| $[5]$ | Punch drive motor (M1) | - | - |

### 10.3 Operation

### 10.3.1 Skew correction control

- Skew in paper is corrected to reduce skew in punch holes when the punch operation is performed.
- A loop at the end of paper is created before the FNS entry roller during transporting paper, by which the paper skew is corrected.

| $[1]$ | Puncher | $[2]$ | FNS entrance sensor (PS4) (finisher section) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Creating loop | $[4]$ | Paper |

| $[5]$ | FNS entry roller (finisher section) | $[6]$ | Transport roller (finisher section) |
| :--- | :--- | :--- | :--- |

## (1) Skew correction process

1. The FNS entrance sensor detects that paper has reached the FNS entry roller.
2. The stopped FNS entry roller presses the paper, by which a loop is created at the end of paper.
3. Rotation of the FNS entry roller and transport roller starts when a predetermined amount of time elapses after the FNS entrance sensor detects paper. The paper that has been corrected for skew is then transported.
4. The holes are punched by the puncher.

## (2) Punch Regist Loop Size Adjustment function

- Punch resists values that are accessed in Service Mode can be adjusted to adjust the punch holes if the punch holes are tilted.
- Punch resists values (resist loop value) are changed when the timing at which the FNS entry roller starts rotating is changed.

### 10.3.2 Punch control

- At the punch section, the holes are punched at the trailing edge of the paper transported from the horizontal transport section when the paper is fed into the finisher section. Punching is conducted paper by paper.
- The punch drive motor drives to move the puncher up and down, thus to make punch holes in the paper
- Punch dust generated by punching is received in the punch dust box.
- The punch kits for $2 / 3$ holes or $2 / 4$ holes areas have the configuration to switch the number of punch holes.

## (1) Punching operation

- The paper is transported to the finisher section by the RU transport motor driving the RU section horizontal transport roller/3.
- The paper which skew is removed is transported to the punch section by the FNS entrance roller, and then stop the specified position.
- The drive source for the punch section is the punch drive motor.
- The puncher frame is driven in forward/reverse direction by rotating the punch drive motor in forward/reverse direction.
- When the puncher frame moves in forward or reverse, the puncher moves vertically in accordance with the shape of the puncher frame cam to punch the holes in paper.
- The transport roller in the finisher section transports the punched paper from the punch section to the finisher transport section.

| $[1]$ | Puncher drive gear | $[2]$ | Puncher frame |
| :--- | :--- | :--- | :--- |
| $[3]$ | Puncher | $[4]$ | Punch drive motor (M1) |

(2) Punch kit type

| $[1]$ | 2 holes punch kit | $[2]$ | 2 holes/3 holes punch kit (Switchable the hole number) |
| :--- | :--- | :--- | :--- |
| $[3]$ | 2 holes/4 holes punch kit (Switchable the hole number) | $[4]$ | 4 holes punch kit |

## (3) Changing the number of punch holes

- Puncher frame 1 and the puncher frame 2 have cams with different shapes.
- When the puncher drive gear rotates clockwise, the puncher frame 1 shifts to the front side, and the puncher frame 2 shifts to the back side.
- When the puncher drive gear rotates counter-clockwise, the puncher frame 1 shifts to the back side, and the puncher frame 2 shifts to the front side.
- The puncher connected to the puncher frame then moves up/down with the cam.
- Switching the forward and reverse direction of the punch drive motor switches the number of punch holes.

| $[1]$ | Puncher frame 1 | $[2]$ | Puncher |
| :--- | :--- | :--- | :--- |
| $[3]$ | Puncher frame 2 | $[4]$ | Punch drive motor (M1) |

### 10.3.3 Puncher up/down status detection configuration

- The puncher frame 1 has two light-blocking plates to detect the position of the puncher frame.
- The punch drive motor has a round light-blocking plate and the puncher motor sensor on the same shaft to detect the rotation value (pulse) of the punch drive motor.
- The up/down status of the puncher is detected by the coordination input from the puncher position sensor, punch home sensor, and the punch motor sensor.

| $[1]$ | Punch home sensor (PS1) | $[2]$ | Punch position sensor (PS2) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Punch drive motor (M1) | $[4]$ | Punch motor sensor (PS3) |
| $[5]$ | Puncher frame 1 | - | - |

10.3.4 Punch dust box full detection mechanism

- The punch unit has the sensor to detect the punch dust full at the front side (emission) and the back side (receiving). The sensor detects the status of the punch dust.
- A state that the punch dust box is full is determined when enough punch dust accumulates in the punch dust box to block the sensor light.
- A message is displayed on the control panel to indicate a "punch dust full" condition when a punch dust box full is detected.

| $[1]$ | Punch dust full sensor/in (PS5) | $[2]$ | Punch dust full sensor/out (PS4) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Punch dust box | - | - |

### 10.3.5 Punch dust box installation detection mechanism

- The actuator blocks the sensor light on the punch dust full sensor/in side when the punch dust box is not installed.
- The "Punch dust box full" warning appears on the control panel when the punch function is configured while the punch dust box is not installed.
- With the punch dust box being installed, the actuator is pressed and moved to a position where the sensor light is not blocked.
- This operation is used to determine the installation state of the punch dust box.

| $[3]$ | Punch dust box | - |
| :--- | :--- | :--- |

## PL THEORY OF OPERATION FS-537/FS-537SD/RU-513/PK-523/JS-602/ PI-507/ZU-609

1. Section configuration

- For the FS-537 model, the horizontal transport section, transport section, alignment section, output tray (main tray/sub tray), and stapler section are all integrated.
- The FS-537SD is the model of a finisher that the saddle section is added to FS-537

| $[1]$ | Transport section | $[2]$ | Saddle section |
| :--- | :--- | :--- | :--- |
| $[3]$ | Stapler section | $[4]$ | Alignment section |

## 3. RU-513

### 3.1 Configuration

- The RU section (horizontal transport section) transfers paper that is fed out from the MFP paper exit section to an optional finisher paper feed section.
- The RU door is installed at the upper part of the RU section. Access to the horizontal transport roller is enabled by opening the door upward. To be used for periodical cleaning of the roller and dealing with the paper misfeed at the RU section and other necessary operations.

| $[1]$ | 3rd exit tray full sensor (PS1): Exit section of MFP | $[2]$ | 3rd exit tray full sensor actuator: Exit section of MFP |

RU section door is opened

[2]

| $[1] ~ R U ~ s e c t i o n ~ d o o r ~$ | $[2] \quad$ Horizontal transport section |
| :--- | :--- | :--- |

### 3.2 Drive

- The RU transport motor drives the RU section. It drives three RU section horizontal transport roller.
- The RU section horizontal transport roller is driven using the drive belt.

| $[1]$ | RU section horizontal transport roller/1 | $[2]$ | RU section horizontal transport roller/2 |
| :--- | :--- | :--- | :--- |
| $[3]$ | RU section horizontal transport roller/3 | $[4]$ | RU transport motor (M1) |

### 3.3 Operation

### 3.3.1 Paper transport control

- It transports the paper that is discharged from the lower exit of the MFP paper exit section, to the RU section with the feed guide.
- It transports the paper to the FNS section, using three RU section horizontal transport rollers.
- The RU entrance sensor actuator is installed downstream of the paper path of the RU section horizontal transport roller/1, and the RU entrance sensor detects the paper transportation status.

## Perspective view

| $[1]$ | 3rd exit tray full sensor (PS1) | $[2]$ | 3rd exit tray full sensor actuator |
| :--- | :--- | :--- | :--- |
| $[3]$ | RU section horizontal transport roller | $[4]$ | RU transport motor (M1) |

| $[7]$ | RU entrance sensor actuator | - | - |

Front view

### 3.3.2 RU section door open/close detection mechanism

- The RU cover open/close detection sensor installed at the front left of the RU section, detects open/close of the RU door.
- Opening the RU door, the warning screen will display on the control panel. All the setting operations and jobs are disabled while the warning screen is displayed. The printing job is interrupted, and the paper being transported causes paper misfeed. The warning screen can be cancelled by closing the door.

| $[1]$ | $R U$ cover open/close detection sensor (PS3) | - |
| :--- | :--- | :--- |

[1]

[2]

| $[1] \quad \mathrm{RU}$ door | [2] $\quad$ RU cover open/close detection sensor (PS3) |
| :--- | :--- |

### 3.3.3 3rd exit tray full detection mechanism

- When a predetermined quantity of paper is discharged to the 3rd exit tray, the 3rd exit tray full sensor actuator will be pushed up by the discharged paper. When the actuator is pushed up to the predetermined position, the 3rd exit tray full sensor will be blocked by the actuator to detect the exit tray full.
- The 3rd tray full is detected, the warning screen will display on the control panel. All setting operations and jobs will be disabled when the warning message is displayed on the screen. The warning screen will be released by removing the paper on the 3rd exit tray.

## 4. FINISHER SECTION

### 4.1 Door open/close detection mechanism

### 4.1.1 Front door open/close detection mechanism

- The front door open detect switch installed at the front right of the FNS section detects open/close of the finisher's front door.
- Open the front door, the warning screen will display on the control panel. All the setting operations and jobs are disabled while the warning screen is displayed. The printing job is interrupted, and the paper being transported causes a paper misfeed. The warning screen can be cancelled by closing the door.

| $[1]$ | Front door open detect switch $($ SW1 $)$ | $[2]$ | Front door |
| :--- | :--- | :--- | :--- |
| $[3]$ | Front door open/close detection lever | - | - |

## 5. TRANSPORT SECTION

### 5.1 Configuration

| $[1]$ | Sub tray discharge motor (M18) | $[2]$ | Receiving roller retraction motor (M10) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Route change gate motor (M4) | $[4]$ | FNS entry transport motor (M20) |
| $[5]$ | ZU discharge motor (M21) | $[6]$ | SD discharge motor (M16) |
| $[7]$ | FNS entrance sensor (PS34) | $[8]$ | Saddle section exit roller 2 |
| $[9]$ | FNS entrance roller | $[10]$ | Transport roller 2 |
| $[11]$ | FNS middle sensor (PS36) | $[12]$ | Receiving roller |
| $[13]$ | Main tray exit sensor (PS37) | $[14]$ | Saddle section exit roller 1 |
| $[15]$ | Sub tray exit sensor (PS24) | $[16]$ | Sub tray exit roller |

### 5.2 Drive

| $[1]$ | Sub tray/JS route change gate | $[2]$ | Sub tray discharge motor (M18) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Route change gate motor (M4) | $[4]$ | Route change gate |
| $[5]$ | Pl transport roller | $[6]$ | FNS entrance roller |
| $[7]$ | FNS entry transport motor (M20) | $[8]$ | SD discharge motor (M16) |
| $[9]$ | Saddle section exit roller 2 | $[10]$ | ZU discharge motor (M21) |
| $[11]$ | Transport roller 2 | $[12]$ | Saddle section exit roller 1 |
| $[13]$ | Receiving roller | $[14]$ | FNS discharge motor (M17) |
| $[15]$ | Receiving roller retraction motor (M10) | $[16]$ | Sub tray transport roller |
| $[17]$ | Sub tray exit roller | - | - |

### 5.3 Operation

### 5.3.1 Route change gate

- The route change gate switches the paper transport path between the main tray and the sub tray.
- The route change gate motor drives to move the route change gate vertically to switch between the paper paths.
- The route change gate home sensor detects the vertical position of the route change gate.

| $[1]$ | Route change gate motor (M4) | $[2]$ | Route change gate home sensor (PS21) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Transport roller 1 | $[4]$ | Transport roller 2 |
| $[5]$ | Route change gate | $[6]$ | Cam |

## (1) Route change gate operation

- The cam rotates when the route change gate motor is driving.
- Rotation of the cam moves the route change gate vertically to switch the paper path between the main tray and sub tray.

[1]

[2]

| $[1]$ | Main tray output | $[2]$ | Sub tray output |
| :--- | :--- | :--- | :--- |
| $[3]$ | Route change gate | $[4]$ | Cam |

### 5.3.2 Sub tray/JS route change gate

- The sub tray/JS route change gate switches the path for transporting paper to either the sub tray or the optional job separator (JS-602).
- The sub tray discharge motor drives to move the sub tray/JS route change gate horizontally to switch between the paper paths.
- The sub tray/JS route change gate home sensor detects the horizontal position of the sub tray/JS route change gate.

| $[1]$ | Sub tray discharge motor (M18) | $[2]$ | Sub tray/JS route change gate home sensor (PS23) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Cam | $[4]$ | Sub tray transport roller |

| $[5]$ | Sub tray/JS route change gate | Sub tray section exit roller |
| :--- | :--- | :--- |

## (1) Sub tray/JS route change gate operation

- The cam rotates when the sub tray discharge motor is driving.
- The cam rotates to move the sub tray/JS route change gate horizontally to switch the paper paths between the sub tray and the job separator.
- The sub tray discharge motor drives the sub tray section exit roller. The forward and reverse rotation of the sub tray discharge motor switches between discharging to the sub tray and driving the sub tray/JS route changing gate.

[1]

[2]

| $[1]$ | Sub tray output | $[2]$ | Job separator output |
| :--- | :--- | :--- | :--- |
| $[3]$ | Sub tray/JS route change gate | $[4]$ | Cam |

### 5.3.3 Receiving roller section up/down function

- The up/down movement of the receiving cam switches the timing of transporting the paper to the alignment section.
- The up/down operations of the receiving cam are driven by the receiving roller retraction motor.
- The position of the receiving cam is detected by the receiving roller retraction sensor.
- The cam rotates to raise or lower the receiving roll to pressure and release the receiving roller.

| $[1]$ | Receiving com | $[2]$ | Receiving roller retraction motor (M10) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Receiving roller retraction sensor (PS22) | $[4]$ | FNS discharge motor (M17) |
| $[5]$ | Receiving roller | $[6]$ | Receiving roll |

## (1) Receiving roller pressure and release

- When the receiving roll is pressed against the receiving roller, paper is transported to the alignment section by the receiving roller.
- When the receiving roll is released from the receiving roller, paper is in a standby state along the transport path.
- The detection board that is installed on the same shaft as the cam rotates, which changes the state of the receiving roller retraction sensor. Thus, the position of the receiving roll can be determined.
- The receiving roll is determined to be pressing against the receiving roller when the receiving roller retraction sensor is unblocked. The receiving roll is determined to be in the release state when the sensor is blocked.

[1]

[2]

| $[1]$ | Receiving roller pressure | $[2]$ | Receiving roller release |
| :--- | :--- | :--- | :--- |
| $[3]$ | Cam (detection plate) | $[4]$ | Receiving roller retraction sensor (PS22) |
| $[5]$ | Receiving roll | $[6]$ | Receiving roller |

### 5.3.4 Buffer control

- The receiving roller section up/down mechanism is provided to achieve high productivity, by eliminating the time loss for the next sheet of paper during the offset and staple operations.
- This allows handling a print job without reducing the paper transport speed even under the condition where the preceding sets of sheets are being aligned and stapled.
- The first sheet of paper that is transported during the paper sheets alignment is switched back toward the saddle exit direction temporarily.
- After paper sheets are aligned and discharged, the first sheet of paper is transported together with the arrived second sheet to the alignment section.

| $[1]$ | First sheet | $[2]$ | First sheet (switchback) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Sheets (transported to the alignment section) | $[4]$ | Aligned paper sheets |
| $[5]$ | First sheet | $[6]$ | Second sheet |

### 5.3.5 Sub tray output

- The sub tray by the sub tray section exit roller and sub tray transport roller drive to discharge paper that is transported with the sub tray/JS route changing gate to the sub tray.
- The sub tray discharge motor drives the sub tray section roller and sub tray transport roller.

| $[1]$ | Sub tray | $[2]$ | Sub tray exit roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Sub tray discharge motor (M18) | $[4]$ | Sub tray/JS route change gate |
| $[5]$ | Sub tray transport roller | $[6]$ | Sub tray exit sensor (PS24) |

## 6. ALIGNMENT SECTION

### 6.1 Configuration

| $[1]$ | Upper paddle section | $[2]$ | Alignment plate |
| :--- | :--- | :--- | :--- |
| $[3]$ | Exit section | - | - |

### 6.1.1 Upper paddle section

| $[1]$ | Paddle up/down home sensor (PS27) | $[2]$ | FNS paddle motor (M9) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paddle home sensor (PS25) | $[4]$ | Arm drive motor (M8) |

| $[3]$ | Alignment motor/rear (M13) | $[4]$ | Alignment plate/R home sensor (PS6) |
| $[5]$ | Trail edge stopper motor/R (M11) | $[6]$ | Alignment plate/R position sensor (center) (PS5) |
| $[7]$ | Trail edge stopper sensor/R (PS7) | $[8]$ | Trailing edge stopper /R |

| $[9]$ | Trailing edge stopper /F | $[10]$ | Trail edge stopper sensor/F (PS10) |
| :--- | :--- | :--- | :--- |
| $[11]$ | Alignment plate/F position sensor (center) (PS8) | $[12]$ | Trail edge stopper motor/F (M12) |
| $[13]$ | Alignment plate/F home sensor (PS9) | $[14]$ | Alignment motor/front (M14) |

### 6.1.3 Exit section

| $[1]$ | Gripper | $[2]$ | Stack support plate |
| :--- | :--- | :--- | :--- |
| $[3]$ | Trailing edge stopper/C | $[4]$ | Gripper home position sensor (PS3) |
| $[5]$ | Pre-eject drive motor (M2) | $[6]$ | Pre-eject encoder sensor (PS2) |
| $[7]$ | Stacker plate drive motor (M3) | $[8]$ | Stacker plate encoder sensor (PS4) |
| $[9]$ | Gripper motor sensor (PS1) | $[10]$ | Bundle eject motor (M1) |
| $[11]$ | Trail edge stopper home sensor (PS31) | $[12]$ | Stacker plate home sensor (PS30) |
| $[13]$ | Stacker plate position sensor (PS29) | - | - |

### 6.2 Drive

### 6.2.1 Upper paddle

| $[1]$ | Paddle press cam | $[2]$ | Paper press cam |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paddle press cam | $[4]$ | FNS paddle motor (M9) |
| $[5]$ | Arm drive motor (M8) | $[6]$ | Upper paddle |
| $[7]$ | Paper press roll | $[8]$ | Upper paddle |
| $[9]$ | Paddle up/down motor (M7) | - | - |

### 6.2.2 Alignment plate

| $[1]$ | Alignment plate/R | $[2]$ | Alignment motor/rear (M13) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Trail edge stopper motor/R (M11) | $[4]$ | Trailing edge stopper /R |
| $[5]$ | Trailing edge stopper/F | $[6]$ | Trail edge stopper motor/F (M12) |
| $[7]$ | Alignment motor/front (M14) | $[8]$ | Alignment plate/F |

### 6.2.3 Exit section

| $[1]$ | Stack support plate | $[2]$ | Gripper |
| :--- | :--- | :--- | :--- |
| $[3]$ | Gripper drive belt | $[4]$ | Pre-eject drive motor (M2) |
| $[5]$ | Trailing edge stopper/C drive arm | $[6]$ | Stacker plate drive motor (M3) |
| $[7]$ | Bundle eject motor (M1) | $[8]$ | Gripper drive belt |
| $[9]$ | Gripper | - | - |

### 6.3 Operation

### 6.3.1 Upper paddle

(1) Upper paddle control

- Paper that has been transported from the finisher is transported to the alignment section.
- Transported paper is temporarily stored in the alignment section due to gravity-induced dropping. However, the paper press guide and upper paddle are driven to reliably transport paper to the alignment section.
- Paddle up/down motor drive rotates the paper press cam and paddle press cam to lower the paper press guide and the upper paddle assy.
- After the upper paddle assy is lowered, the FNS paddle motor is driven to rotate the upper paddle.
- The vertical motion is repeated for each sheet of paper to transport paper to the alignment section.

| $[1]$ | Paddle up/down motor (M7) | $[2]$ | Paddle press cam |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper press cam | $[4]$ | Paddle press cam |
| $[5]$ | Upper paddle assy | $[6]$ | Upper paddle |
| $[7]$ | Paper press guide | $[8]$ | Upper paddle assy |

## (2) Trailing edge paper press control

- A trailing edge paper press guide is also provided in addition to the paper press guide and the upper paddle assy.
- This component is used to reliably lower the trailing edge of transported paper to the alignment section.
- The arm drive motor drives to rotate the belt and the trailing edge paper press cam
- Cam rotation lowers the trailing edge paper press guide.

| $[1]$ | Trailing edge paper press cam | $[2]$ | Arm drive motor (M8) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Trailing edge paper press guide | - | - |

### 6.3.2 Alignment plate

## (1) Alignment plate

- The alignment plate/F and alignment plate/R align the paper in the width orientation and shift paper sheets.
- The alignment motor and drive belt drives the alignment plates
- The alignment plates operate by the forward and reverse rotation of the alignment motor.
- Alignment plate/F and alignment plate/R are each equipped with a drive motor, which allows them to operate independently.

| $[1]$ | Alignment plate/F | $[2]$ | Alignment plate/R |
| :--- | :--- | :--- | :--- |
| $[3]$ | Alignment motor/rear (M13) | $[4]$ | Alignment plate/R home sensor (PS6) |
| $[5]$ | Alignment plate/R position sensor (center) (PS5) | $[6]$ | Alignment plate/F position sensor (center) (PS8) |
| $[7]$ | Alignment plate/F home sensor (PS9) | $[8]$ | Alignment motor/front (M14) |

## (a) Alignment operation

- The alignment motor/front rotates to move the alignment plate/F via the alignment plate/F drive belt.
- The alignment plate/F home sensor detects the home position of the alignment plate/F.
- The alignment motor/rear rotates to move the alignment plate/R via the alignment plate/R drive belt.
- The alignment plate/R home sensor detects the home position of the alignment plate/R.
- The sheets are placed between the alignment plates/F and /R corresponding to the paper width so that their both ends are aligned.

(b) Shift operation
- When offset is selected as finishing option, the alignment plates are moved to shift the sets of paper. Paper is discharged to the center of the main tray at normal printing and stapling.
- Depending on the width of paper, the alignment plate/F (alignment plate/R) pushes the sets of paper to the rear side (front side) from one side so that the sets of the paper are shifted.
- The sheets are shifted by alternatively repeating the above operation.

## (2) Trailing edge stopper

- The trailing edge stopper/F and trailing edge stopper/R align paper in the feed orientation.
- The trailing edge stopper motor drives the trailing edge stoppers.
- Trailing edge stopper/F and the trailing edge stopper/R shift according to the paper width before starting a job, to hold the trailing edge of the paper.
- For 2-point staple jobs, the trailing edge stoppers/F and /R are retracted to the position where they do not interfere with the stapler.
- After the job is completed, the trailing edge stopper motor reverses the rotation to return the trailing edge stopper to the home position.

| $[1]$ | Trail edge stopper motor/F (M12) | $[2]$ | Trail edge stopper motor/R (M11) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Trail edge stopper sensor/R (PS7) | $[4]$ | Trailing edge stopper /R |
| $[5]$ | Trailing edge stopper/F | $[6]$ | Trail edge stopper sensor/F (PS10) |

### 6.3.3 Exit section

- The trailing edge stopper/C and gripper discharge paper that is processed with the alignment plates, to the output tray.
- The gripper grips the trailing edges of the paper sheets in the alignment tray and transports them to the paper exit position.
- The gripper releases the sets of paper to discharge them to the main tray. The gripper is moved to the home position and brought into a standby state.
- At the same time, the trailing edge stopper/C presses the trailing edge of paper in the alignment tray.

| $[1]$ | Gripper home position sensor (PS3) | $[2]$ | Pre-eject drive motor (M2) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Trailing edge stopper/C | $[4]$ | Bundle eject motor (M1) |
| $[5]$ | Paper transport belt | $[6]$ | Gripper |

## (1) Trailing edge stopper/C operation

- When the pre-eject drive motor rotates, the trailing edge stopper moves from the home position to the paper exit position to discharge paper to the main tray.
- When the drive gear makes a turn, the stopper moves from the paper exit position to the home position and is brought into a standby state
- The trailing edge home position detection sensor detects the home position.

| $[1]$ | Trailing edge stopper/C | $[2]$ | Trail edge stopper home sensor (PS31) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Drive gear | $[4]$ | Pre-eject drive motor (M2) |

## (2) Gripper operation

- The bundle eject motor rotates to turn the paper transport belt. It rotates the gripper that has been fixed to the paper transport belt.
- The gripper home position sensor detects the home position of the gripper.
- The gripper stays at the home position. It rotates at the position [4] shown in the illustration to grip the trailing edge of paper and transport the paper while keeping the state [5]. The gripper rotates at the position [6] in the illustration to release the paper. When the paper transport belt makes a turn, the gripper returns to the home position [7] and is brought into a standby state.

| $[1]$ | Gripper home position sensor (PS3) | $[2]$ | Bundle eject motor (M1) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Gripper motor sensor (PS1) | $[4]$ | Gripper position (gripping the paper) |
| $[5]$ | Gripper position (transporting the paper) | $[6]$ | Gripper position (release the paper) |
| $[7]$ | Gripper home position | - | - |

### 6.3.4 Stack support plate control

- When the paper is transported to the alignment section, the paper may go off the alignment tray depending on the paper size or the printing direction which may cause the paper to be misaligned.
- In order to prevent the paper from being off the alignment tray, the stack support plate is installed.
- The stacker plate drive motor drives to protract the stacker plate via a gear.
- When the specified period of time has passed after the process above is finished, the stacker plate drive motor is driven to retract the stack support plate.
- The stacker plate home sensor detects the home position of the stacker support plate. The stacker plate position sensor detects the upper limit position of the stacker support plate.

| $[1]$ | Stack support plate | $[2]$ | Stacker plate home sensor (PS30) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Stacker plate drive motor (M3) | $[4]$ | Stacker plate position sensor (PS29) |

## 7. STAPLER SECTION

### 7.1 Configuration

| $[1]$ | Stapler unit | $[2]$ | Stapler home position sensor (corner) (PS18) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Stapler movement motor (M19) | $[4]$ | Stapler home position sensor (rear) (PS19) |
| $[5]$ | Stapler position sensor (center) (PS20) | $[6]$ | Stapler move dial |

### 7.2 Drive

- Rotation of the stapler movement motor drives the belt, and moves the stapler holder that is attached to the belt back and forth along the shaft.
- The staple unit moves to the stapler home position, the staple cartridge replacement, or the corner staple position.

| $[1]$ | Stapler movement motor (M19) | $[2]$ |
| :--- | :--- | :--- |
| $[3]$ | Stapler holder | - |

### 7.3 Operation

### 7.3.1 Stapler position detection

- The home position of the stapler is detected by the stapler home position sensor (rear).
- The stapler's staple position is detected by the amount of motor rotation provided by the stapler home position sensor (rear) and stapler position sensor (center).
- The staple cartridge replacement position is detected depending on the amount of stapler movement motor rotation that is based on the stapler position sensor (center).

| $[1]$ | Stapler unit (home position) | [2] $\quad$ Stapler home position sensor (rear) (PS19) |
| :--- | :--- | :--- |

| $[3]$ | Stapler unit (2-staple position) | $[4]$ | Stapler position sensor (center) (PS20) |
| :--- | :--- | :--- | :--- |
| $[5]$ | Stapler unit (2-staple position) | $[6]$ | Stapler unit (staple cartridge replacement position) |
| $[7]$ | Stapler unit (diagonal binding position) | $[8]$ | Stapler home position sensor (corner) (PS18) |

### 7.3.2 Staple control

- The stapling operation is performed by the stapler motor.
- In the stapling operation, the stapler motor drives the clincher side to press the paper. Then, the staple is pushed out from the stapler side and bent at the clincher side.

| $[1]$ | Stapler (clincher side) | $[2]$ | Stapler motor (M5) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Stapler (stapler side) | $[4]$ | Paper |

## (1) Stapling operation

- After completing the alignment operation of the alignment plate, the stapler motor performs the stapling operation.
- The stapling operation is completed when the stapler position sensor in the stapler detects the home position and turn ON.

## (2) Clogged staple detection

- During stapling operation, staple clogging is determined if the stapler position sensor does not turn ON after a specified period of time since it turns OFF. Thus, the stapler motor stops.
(3) Cartridge detection
- The staple empty detect sensor in the staple detects the presence of a cartridge or the incorrect setting of a cartridge.
- When no cartridge is set or it is set incorrectly, the main body displays the error message on its display panel.
(4) Staple detection control
- When the staples run out, the self-priming sensor turns ON and the main body displays the error message on its display panel.

## 8. OUTPUT TRAY SECTION

### 8.1 Configuration

[11]

| $[1]$ | Main tray | $[2]$ | Sub tray |
| :--- | :--- | :--- | :--- |
| $[3]$ | Sub tray full detection sensor/out (PS39) | $[4]$ | Main tray upper sensor/in (PS40) (Not used) |
| $[5]$ | Main tray paper detection sensor (PS13) | $[6]$ | Main tray lift up detection sensor/R (PS17) |
| $[7]$ | Main tray lift down detection sensor/R (PS15) | $[8]$ | Paper receiving control motor (M15) |
| $[9]$ | Main tray full detection sensor (PS12) * | $[10]$ | Main tray up/down motor (M6) |
| $[11]$ | Saddle tray | $[12]$ | Main tray drive belt |
| $[13]$ | Paper delivery control sensor (PS11) | $[14]$ | Main tray lift down detection sensor/F (PS14) |
| $[15]$ | Main tray lift up detection sensor/F (PS16) | $[16]$ | Main tray upper sensor/out (PS38) (Not used) |
| $[17]$ | Sub tray full detection sensor/in (PS41) | - | - |

- *: The installation position of the sensor is different between the FS-537 and FS-537SD models.

### 8.2 Drive

| $[1]$ | Main tray | $[2]$ | Paper detection lever |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper receiving control motor (M15) | $[4]$ | Main tray drive belt/R |
| $[5]$ | Main tray up/down motor (M6) | $[6]$ | Paper detection lever drive shaft |
| $[7]$ | Main tray drive belt/F | - | - |

### 8.3 Operation

### 8.3.1 Main tray up/down mechanism

- Rotation of the main tray up/down motor drives the main tray drive belt to lift and lower the main tray.
- The lower limit position of the main tray (full detection position) is different between the FS-537 and FS-537SD models.

| $[1]$ | Main tray (home position) | $[2]$ | Main tray (main tray full position) *1 |
| :--- | :--- | :--- | :--- |
| $[3]$ | Main tray (main tray full position) *2 | $[4]$ | Main tray full detection sensor (PS12) *1 |
| $[5]$ | Main tray full detection sensor (PS12) *2 | - | - |

- *1: FS-537SD
- *2: FS-537

### 8.3.2 Main tray paper detection

- The main tray paper detection sensor, the main tray lift up detection sensor and the main tray lift down detection sensor keep the specified distance between the upper surface of the paper exited to the main tray and the paper exit opening to eliminate the misalignment of the exited paper.
- The main tray paper detection sensor detects the upper limit position of the main tray.
- The main tray lift up detection sensors ( $F$ and $R$ ) indicate the lifting of the main tray.
- The main tray lift down detection sensors ( $F$ and $R$ ) indicate the lowering of the main tray.
- By operation of the paper detection lever, the on/off states of the main tray lift up detection sensors and the main tray lift down detection sensors are detected.
- The paper receiving control motor drives the paper detection lever. The paper delivery control sensor detects the home position of the paper detection lever.
- The paper detection lever is operated each time a sheet of paper is discharged. This operation is used to confirm the alignment of discharged paper and the discharge state of the main tray.

| $[1]$ | Main tray | $[2]$ | Main tray paper detection sensor (PS13) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper receiving control motor (M15) | $[4]$ | Main tray lift up detection sensor/R (PS17) |
| $[5]$ | Main tray lift down detection sensor/R (PS15) | $[6]$ | Main tray lift down detection sensor/F (PS14) |
| $[7]$ | Main tray lift up detection sensor/F (PS16) | $[8]$ | Paper delivery control sensor (PS11) |

## (1) Main tray operation

- The paper detection lever and main tray paper detection sensor confirm the paper load status of the main tray and main tray position (height) when the printing starts.
- The paper detection lever is operated to confirm the state of the main tray lift detection sensor
- When the main tray lift up detection sensor is on and the main tray paper detection sensor is off, the main tray is lifted until the main tray paper detection sensor turns on.
- The paper detection lever returns to the home position. The system waits for the discharged paper.
- After the paper is discharged into the main tray, the paper detection lever is operated to confirm the load status of the main tray. At this time, if the main tray lift down detection sensor is on, the main tray is lowered to a predetermined height. If this sensor is off, the lower operation is not performed.
- This paper detection lever is driven for each sheet of discharged paper to confirm the load status of the main tray.
- After the printing completes the paper detection lever returns to the home position.
- The main tray operation (lifting) is not performed as long as there is a subsequent print instruction even if the discharged paper is removed.

| $[1]$ | Main tray lift up state | $[2]$ | Finisher stop state |
| :--- | :--- | :--- | :--- |
| $[3]$ | Main tray paper load status (no discharged paper) | $[4]$ | Main tray paper load status (with discharged paper) |
| $[5]$ | Paper detection lever (home position) | $[6]$ | Main tray lift down detection sensor/F (OFF) |
| $[7]$ | Main tray lift up detection sensor/F (ON) | - | - |

### 8.3.3 Tray full detection mechanism

## (1) Main tray

- The main tray has the paper full detection mechanism.
- When paper full is detected, the warning message appears on the control panel.
- In this state, any main tray related configurations and jobs that use the main tray cannot be performed.

## (a) Paper full detection mechanism 1

- When machine determines that the amount of paper stacked on the main tray exceeds the specified height, the paper detection lever causes the main tray up/down motor to rotate to lower the main tray to the specified position.
- When the main tray is lowered to the position of the main tray full detection sensor, the main tray full is determined.

| $[1]$ | Main tray (main tray full position)*1 | $[2]$ | Main tray (main tray full position) *2 |
| :--- | :--- | :--- | :--- |
| $[3]$ | Main tray full detection sensor (PS12) | $[4]$ | Actuator |

- *1: FS-537SD
- *2: FS-537

## (2) Sub tray

- When paper is discharged into the sub tray, the stacked paper blocks the sub tray full detection sensor. This blocked state is interpreted as a detection of a full exit tray.
- When the sub tray full is detected, the warning message appears on the control panel.
- In this state, any sub tray configurations and jobs that use the sub tray cannot be performed.

| $[1]$ | Sub tray full detection sensor/out (PS39) | $[2]$ | Sub tray full detection sensor/in (PS41) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Sub tray | $[4]$ | Paper |

## 9. SADDLE SECTION FS-537SD

### 9.1 Configuration

## NOTE

- FS-537SD only

Front left side perspective view

| $[1]$ | Staple unit | $[2]$ | Center folding roller/2 |

### 9.2 Transport section

### 9.2.1 Drive

| $[1]$ | SD transport motor (M1) | $[2]$ | Curl cover detection sensor (PS2) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper discharge control motor (M2) | $[4]$ | Curl cover |
| $[5]$ | SD transport roller | $[6]$ | SD entrance sensor (PS1) |
| $[7]$ | FNS discharge motor (M3) | - | - |

### 9.2.2 Paper transport

- The FNS discharge motor rotates reversely to transport the paper from the finisher transport section into the saddle unit.
- The paper then is transported to the alignment section by SD transport roller.
- The SD transport roller rotates when the SD transport motor is driven.

### 9.2.3 Curl cover

- The paper is transported to the alignment section one-by-one. A paper which is curled may cause paper misfeed at the entrance of the saddle stitcher.
- In order to prevent this paper misfeed, the curl cover is installed so that each paper is transported to the alignment section without fail.
- The curl cover is operated by the paper discharge control motor. Paper receiving opens/closes the feeding port inside the saddle unit entrance when the paper discharge control motor rotates in forward/reverse direction.

| $[1]$ | SD transport motor (M1) | $[2]$ | Curl cover detection sensor (PS2) |
| :--- | :--- | :--- | :--- |

### 9.3 Alignment section

### 9.3.1 Drive

| $[1]$ | Center folding section upper paddle | $[2]$ | Alignment plate/F |
| :--- | :--- | :--- | :--- |
| $[3]$ | SD paddle motor (M7) | $[4]$ | Stopper guide |
| $[5]$ | Stopper drive motor (M4) | $[6]$ | Paper grip |
| $[7]$ | Center folding section lower paddle | $[8]$ | Alignment plate/R |

### 9.3.2 Alignment

- It aligns the paper transported to the alignment section.
- The paper CD alignment is conducted by alignment plate/F and alignment plate/R. The alignment plate shifts by forward/reverse rotation of the alignment motor to align the paper edge.
- The paper FD alignment is conducted by the stopper guide, center folding section upper paddle and center folding section lower paddle.
- The stopper guide moves up when the stopper drive motor rotates in forward/reverse direction to stop at the position which suits the length of the paper transported. The leading edge of the paper stops by the stopper guide to align the leading edge.
- When the paper is transported, the stopper drive motor rotates in forward/reverse direction to operate the stopper guide drive belt, and moves the stopper guide up/down.
- The center folding section upper paddle and the center folding section lower paddle are installed in order to receive the transported paper to the alignment section without fail.
- The paddle is driven by the SD paddle motor.

| $[1]$ | Center staple/fold stacker paper detect sensor (PS3) | $[2]$ | Alignment home sensor (PS4) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Alignment plate/F | $[4]$ | SD paddle motor (M7) |
| $[5]$ | Stopper guide | $[6]$ | Stopper drive motor (M4) |
| $[7]$ | Stopper guide drive belt | $[8]$ | Center folding section lower paddle |
| $[9]$ | Alignment motor (M3) | $[10]$ | Alignment plate/R |
| $[11]$ | Center folding section upper paddle | - | - |

(1) Alignment operation

- When the saddle exit sensor of the finisher detects the leading edge of the paper, the alignment motor starts rotating in the direction to close the alignment plate, and the alignment plate/F and the alignment plate/R stop at the position where it is slightly wider than the paper width.
- When the specified period of time has passed after the SD entrance sensor detects the trailing edge of the paper, the alignment motor rotates in forward/reverse direction to do oscillation of the alignment plate to align paper.
- The oscillation of the alignment plate is conducted each time a sheet of paper is transported, and the alignment plate is shifted to the standby position after the alignment operation is finished.
- The home position of the alignment plate is detected by the alignment home sensor.

## (2) Stopper guide operation

- The stopper guide is moved up according to the paper size.
- The stopper guide moves up and stops at the specified position after the leading edge of the paper passes the main tray exit sensor.
(3) Paddle operation
- The up/down paddle is driven by the SD paddle motor. The up/down paddle is driven when the specified period of time has passed after the leading edge of the paper passed the saddle exit sensor of the finisher.
- The up/down paddle stops after the paper trailing edge passes the finisher's main tray exit sensor and the paddle rotates for the specified number of times.

### 9.3.3 Stopper guide

- At the stopper guide, paper is aligned in the FD direction. Paper conveyed to the aligning section is conveyed to the specified position.
- The exit grip holds the paper when shifting it to the specified position and when stapling papers.
- The alignment section, staple position and other positions (center folding, saddle folding, tri-folding) have their own up/down stop positions. They are controlled by the pulse number of the stopper drive motor.

## (1) Stopper operation

- The stopper drive motor moves the stopper guide up and down in accordance with the paper size. The stopper home sensor detects the home position.

| $[1]$ | Stopper guide | $[2]$ | Exit grip/Fr |
| :--- | :--- | :--- | :--- |
| $[3]$ | Stopper drive motor (M4) | $[4]$ | Stopper home sensor (PS6) |
| $[5]$ | Exit grip/Rr | - | - |

(2) Stopper control

| $[1]$ | Center folding knife assy | $[2]$ | Stopper guide |
| :--- | :--- | :--- | :--- |
| $[3]$ | Exit grip/Fr | $[4]$ | Exit grip/Rr |
| $[5]$ | Center folding roller/2 | $[6]$ | Center folding roller/1 |

(a) Folding mode

- After a specified period of time since the last sheet of paper was aligned, the stopper solenoid is turned ON and the sheets of paper are held in place.
- After the sheets are held in place, the stopper drive motor rotates to move the stopper guide down and lower the sheets to the folding position.
(b) Saddle stitching mode
- After a specified period of time since the last sheet of paper was aligned, the stopper solenoid is turned ON and the sheets of paper are held in place.
- After the sheets are held in place, the stopper drive motor rotates to move the stopper guide down and lower the sheets to the saddle stitching position.
- After a specified period of time since stapling operation was completed, the alignment motor opens the alignment plates and the stopper drive motor starts rotating to move the stopper guide further down and lower the paper to the folding position.

## (c) Tri-folding mode

- After a specified period of time since the last sheet of paper was aligned, the stopper solenoid is turned ON and the sheets of paper are held in place.
- After the sheets are held in place, the stopper drive motor rotates to move the stopper guide down and lower the sheets to the 1 st folding position in the tri-folding.

### 9.4 Stapler

### 9.4.1 Drive

[1] Stapler unit $\quad$ [2] Stopper drive motor (M4)

| $[3]$ | Stopper home sensor (PS6) | $[4]$ | Stopper guide |
| :--- | :--- | :--- | :--- |
| $[5]$ | Alignment tray | - | - |

### 9.4.2 Operation

- The stapling operation is performed by the stapler motor.

## (1) Stapling operation

- The stapling operation is performed by the staple motor in the stapler.
- The drive gear pushes out the pressed portion of the paper toward the clincher to hold the paper, and then the pin will be pushed out.
- When the pin penetrates the paper batch, the pin will be bent to staple the paper batch at the clincher section.

| $[1]$ | Clincher | $[2]$ | Drive gear |
| :--- | :--- | :--- | :--- |
| $[3]$ | Stapler motor | $[4]$ | Staple |
| $[5]$ | Stapler | - | - |

(2) Staple control

| $[1]$ | Staple unit | [2] | Staple cartridge (Front side): Removed |
| :--- | :--- | :--- | :--- |
| $[3]$ | Staple cartridge (Rear side): Installed | - | - |

(a) Stapling

- After completing the alignment operation of the alignment plate, the staple motor performs the stapling operation.
- The stapling operation is completed when the stapler home position sensor (rear) detects the home position and turn ON.

## (b) Clogged staple detection

- When the stapler home position sensor (rear) does not turn ON after the specified period of time after it turned OFF during stapling, it is determined that the staple motor has the trouble, and stops the stapler motor.

## (c) Staple cartridge detection

- The staple cartridge switch detects the presence of a cartridge or the incorrect settings of a staple cartridge.
- When no staple cartridge is installed or it is installed incorrectly, an error message appears on the machine control panel.
(d) Staple detection control
- When the staple goes empty, the staple empty switch turns ON and a message appears on the machine control panel.

### 9.5 Folding/Saddle stitching

### 9.5.1 Drive

| $[1]$ | Tri-folding guide motor (M6) | $[2]$ | Tri-folding roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Center fold knife motor (M9) | $[4]$ | Center fold roller motor (M5) |
| $[5]$ | Saddle section exit roller | - | - |

| $[1]$ | Center folding roller/1 | $[2]$ | Center folding roller/2 |
| :--- | :--- | :--- | :--- |
| $[3]$ | Center fold knife home sensor (PS8) | $[4]$ | Fold drive gear/Rr |
| $[5]$ | Center fold knife motor (M9) | $[6]$ | Center folding knife assy |
| $[7]$ | Fold drive gear/Fr | $[8]$ | Tri-folding guide motor (M6) |

### 9.5.2 Folding knife

- The center fold knife motor drives the folding knife.
- The folding knife is used in the folding/saddle stitching/tri-folding mode.
- In the tri-folding mode, it is used at the 1st folding.

## (1) Folding knife operation

- The center fold knife motor rotates the crank shaft a half turn via the gear, and pushes the paper to the nip section with the folding knife.
- The folding rollers draw and fold the paper.
- The position of the stopper guide controls the folding position.

## (2) Folding knife control

- The center fold knife motor turns ON and sticks out the folding knife to the paper after a specified period of time since the stopper guide stops at the folding position.
- The center fold knife motor stops when the folding knife reciprocates after fold operation is completed and the center fold knife home sensor turns OFF.

### 9.6 Tri-folding

### 9.6.1 Drive

| $[1]$ | Tri-folding knife assy | $[2]$ | Center fold guide motor (M8) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Guide home sensor (PS7) | $[4]$ | Tri-fold guide motor (M6) |
| $[5]$ | Tri-folding gate home sensor (PS11) | $[6]$ | Center folding change gate |
| $[7]$ | Tri-folding roller | $[8]$ | Fold exit sensor (PS12) |
| $[9]$ | Tri-folding knife | - | - |

### 9.6.2 Tri-folding operation

1. When the center fold guide motor drives, the tri-folding gate rotates. The leading edge of the paper to which the first fold was applied at the center folding section, will be transported to the tri-folding path.
2. When the tri-folding guide motor drives, the tri-folding knife assy drive gear rotates to move down the tri-folding knife assy. The paper to which the first fold is applied at the center folding section will be pushed out to the tri-folding roller.
3. The paper is pulled into the tri-folding roller to tri-fold the paper.
4. When tri-folding is finished, the tri-folding gate will return to the home position. The home position of the tri-folding gate is detected by the tri-folding gate home sensor.

| $[1]$ | Tri-folding knife assy | $[2]$ | Tri-folding knife assy drive gear |
| :--- | :--- | :--- | :--- |
| $[3]$ | Center folding roller/1 | $[4]$ | Paper |
| $[5]$ | Center folding roller/2 | $[6]$ | Tri-folding roll |
| $[7]$ | Tri-folding roller | $[8]$ | Tri-folding gate |
| $[9]$ | Tri-folding knife | - | - |

### 9.7 Exit section

### 9.7.1 Drive

| $[1]$ | Center fold guide motor (M8) | $[2]$ | Tri-fold guide motor (M6) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Tri-folding gate home sensor (PS11) | $[4]$ | Center folding roller/2 |
| $[5]$ | Center folding roller/1 | $[6]$ | Fold exit sensor (PS12) |
| $[7]$ | Booklet tray empty detection sensor/in (PS13) | $[8]$ | Center fold roller motor (M5) |
| $[9]$ | Booklet tray empty detection sensor/out (PS14) | $[10]$ | Paper press |
| $[11]$ | Saddle tray | $[12]$ | Tri-folding roller |
| $[13]$ | Saddle section exit roller | $[14]$ | Guide home sensor (PS7) |

### 9.7.2 Paper exit

- Center folded, saddle stitched, or tri-folded paper is discharged to the saddle tray.
- The paper that is center folded and saddle folded is sent though the upper route, and the tri-folded paper is sent through the lower route to be discharged.
- The paper is discharged by driving the exit roller and the tri-fold roller. Both rollers are driven by the center fold roller motor.

## (1) Paper exit for center fold / saddle stitch

- The center fold roller motor is driven after the center fold or the saddle stitch, and discharges the paper to the saddle tray by the paper exit roller.

| $[1]$ | Center folding roller/1 | $[2]$ | Fold exit sensor (PS12) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Booklet tray empty detection sensor/in (PS13) | $[4]$ | Paper press |
| $[5]$ | Paper transport route | $[6]$ | Saddle tray |
| $[7]$ | Booklet tray empty detection sensor/out (PS14) | $[8]$ | Saddle section exit roller |
| $[9]$ | Tri-folding roller | $[10]$ | Center folding roller/2 |
| $[11]$ | Folding knife | - | - |

## (2) Paper exit for tri-folding

- Since the paper is tri-folded by the tri-folding roller, the paper is transported through the lower route.

| $[1]$ | Center folding roller/1 | $[2]$ | Tri-folding knife |
| :--- | :--- | :--- | :--- |
| $[3]$ | Fold exit sensor (PS12) | $[4]$ | Booklet tray empty detection sensor/in (PS13) |
| $[5]$ | Paper press | $[6]$ | Paper transport route |
| $[7]$ | Saddle tray | $[8]$ | Booklet tray empty detection sensor/out (PS14) |

| $[9]$ | Saddle section exit roller | $[10]$ | Tri-folding roller |
| :--- | :--- | :--- | :--- |
| $[11]$ | Center folding roller/2 | $[12]$ | Folding knife |

### 9.7.3 Paper transport belt

- The paper transport belt transports the processed paper to the leading edge of the tray. Besides, the paper transport belt drives to prevent paper jams at the trailing edge of the tray.

## (1) Transport operation

- After the leading edge of paper passes the fold exit sensor (PS12) for a predetermined amount of time, the paper transport belt motor rotates to drive the paper transport drive belt. As the exit path is different for center folding and tri-folding, the start and stop timings of the belt differ.
- The exit tray is equipped with an SD exit full sensor to detect paper at the exit port. When there is no paper at the exit port, the belt is driven until the leading edge of paper reaches the exit port. When there is paper at the exit port, the belt is driven after the leading edge of paper reaches the port.

| $[1]$ | Paper press | [2] | Paper path for center folding and center staple |
| :--- | :--- | :--- | :--- |
| $[3]$ | Fold exit sensor (position for center folding and center <br> staple) | $[4]$ | Paper path for tri-folding |
| $[5]$ | Fold exit sensor (position for tri-folding) | $[6]$ | Paper transport drive belt |
| $[7]$ | SD exit full sensor (PS35) | $[8]$ | Exit tray full detection actuator |

## (2) Exit tray upper limit detection

- The exit tray is equipped with an SD exit tray limit sensor to detect the load of paper in the exit tray.
- The counter starts after the SD exit tray limit sensor turns on. The finisher is stopped after the counter reaches a predetermined number, which functions as the exit tray upper limit.
- When the printing in different modes continues for some time, the mode that produces the smallest load amount is used to detect the upper limit.

## (3) Paper transport belt forced drive mechanism

- Lift the leading edge of the exit tray, and thus the paper transport drive belt can be manually driven. This operation will cause paper in the exit port to move to the leading edge of the exit tray.
- The normal exit tray is secured with screws. Remove the single exit tray lock screw at the rear of the exit tray to lift this exit tray.

| $[1]$ | Exit tray normal position | $[2]$ | Exit tray |
| :--- | :--- | :--- | :--- |
| $[3]$ | SD exit tray lift sensor (PS43) | $[4]$ | Exit tray lifting state |

[1] Exit tray lock screw
10. PK-523

### 10.1 Configuration

| $[1]$ | Punch unit | $[2]$ | Punch scraps box |
| :--- | :--- | :--- | :--- |
| $[3]$ | Punch control board $(\mathrm{PKCB})$ | - | - |

### 10.2 Drive

### 10.2.1 Punch shift section

| $[1]$ | Punch oscillating assy shift | $[2]$ | Punch oscillating assy gear |
| :--- | :--- | :--- | :--- |
| $[3]$ | Punch oscillating motor $($ M302 $)$ | $[4]$ | PK punch home sensor/2 (PS303) |

10.2.2 Punch section

| $[1]$ | Punch motor pulse sensor (PS306) | $[2]$ | Punch drive motor (M301) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Punch blade drive guide/R | $[4]$ | Punch blade |

| $[5] \quad$ Punch blade drive guide/L | $-\quad-$ |
| :--- | :--- | :--- |

### 10.3 Operation

### 10.3.1 Punch standby position movement control

- Once the power is turned on, the punch oscillating motor rotates until the PK punch oscillation home sensor turns on to move the punch unit to the home position.
- When punch mode is selected, one of the five sensors corresponding to the paper size detects paper and moves the punch unit. After the job completes, the punch unit returns to the home position.
- When punch mode is not uses, the punch oscillation section is driven and moved to a predetermined position that will not cause feed jams.
<Example.: A4 size>

| $[1]$ | Distance of movement from the paper edge | $[2]$ | Paper size detect board (PSDTB) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Punch blade | $[4]$ | Punch unit |
| $[5]$ | Paper | $[6]$ | Paper transfer direction |

### 10.3.2 Punch position correction control

The following procedure is used to correct the position of the punch unit that is positioned internally from the side edge of paper. So that, the center of paper can be punched at any time. By oscillation of the punch unit back and forth while paper is transported, so the punch position correction is performed.

- After the punch operation starts, or the paper size detection or punch operation completes, the punch unit is moved forward once until the paper size detect board detects the side edge of paper. The punch unit is then moved backward until the paper size detect board detects the side edge of paper again. (Position detection based on side edges)
- When the side edge positions are detected, the punch unit is again moved and positioned so that the center of the punch blade aligns with the center of the paper. The amount of distance and travel direction varies depending on the paper size.
<Example.: A4 size>

| $[1]$ | Side edge position | $[2]$ | Paper size detect board (PSDTB) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Punch blade center | $[4]$ | Punch blade |
| $[5]$ | Punch unit | $[6]$ | Front side |
| $[7]$ | Rear side | $[8]$ | Direction of punch unit movement |
| $[9]$ | Paper | $[10]$ | Center of paper |

| $[11]$ | Paper transfer direction | - |
| :--- | :--- | :--- |

### 10.3.3 Punch control

## (1) Registration loop control

The FNS entry transport motor (finisher section) turns OFF temporarily to stop conveyance of paper when the specified time has passed since paper exit sensor detected the leading edge of the paper. Thus the paper is pressed against the entrance roller forming a loop to correct the bend. When the specified time has passed, the FNS entry transport motor (finisher section) turns ON to restart conveying the paper.
[1]

| $[1]$ | Punch kit | $[2]$ | FNS entry roller (finisher section) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Loop formation | - | - |

## (2) Punch control

Transmitting the start signal from the main body, the FNS entry transport motor (finisher section) rotates.
In the punch mode, the FNS entry transport motor (finisher section) stops temporarily a specified period of time after the FNS entrance sensor detects the trailing edge of the paper.
At the same time, the punch drive motor is driven to move the punch blade drive guide/L/R horizontally. The punch blade drive guide has slots to shift punch blades up and down. Punch blades moving downward conduct the punch operation. punch drive motor stops and the punch operation is completed when the PK punch hole position sensor turns ON.
The FNS entry transport motor (finisher section) rotates again to convey the paper a specified period of time after it stops temporarily.

10.3.4 Punch scraps box control

| $[1]$ | Punch kit | $[2]$ | PK punch hole scraps box full sensor (PS302) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Punch scraps box | $[4]$ | Punch scraps box set sensor (PS28: finisher section) |

(1) Punch scraps box full sensor

Punch scraps produced by the punch operation drops into the punch scraps box. When the punch scraps box becomes full of punch scraps, the PK punch hole scraps box full sensor turns on. So, the punch scraps box full information is sent to the main body.

## (2) Punch scraps box detection

The punch scraps box set sensor detects the punch scraps box set state. When the punch scraps box is not located, the punch scraps box set sensor turns on and sends the no punch scraps box information to the main body.

### 11.2.2 2nd folding/transport

## NOTE

- The dedicated the ZU transport motor (M500) is required for the finisher when the Z-folding unit is installed.
- At time of set-up, make sure to replace the ZU transport motor (M21) that is attached to the finisher with the supplied the ZU transport motor(M500). However, it is not necessary to install the ZU transport motor(M500) if the post inserter is already installed.

| $[1]$ | Pressure motor (M502) | $[2]$ | Folding guide |
| :--- | :--- | :--- | :--- |
| $[3]$ | ZU transport motor (M500) | $[4]$ | Folding guide motor (M501) |
| $[5]$ | Press home sensor (PS502) | - | - |

### 11.3 Operation

### 11.3.1 1st folding mechanism

(1) FNS middle sensor downstream from paper transport

- To correct the skew of the transported paper, a loop is formed at the FNS entry roller and front of the transport roller. When a predetermined amount of time elapses after the paper passes the FNS entrance sensor, the transport roller is driven to transport paper until it reaches the paper exit sensor.
- Paper that is transported to the finisher passes through the transport roller in the finisher and is transported until it reaches the FNS middle sensor.
- The transport roller is temporarily stopped after the transport roller is rotated for specified times.

| $[1]$ | FNS middle sensor (PS36: finisher section) | $[2]$ | Transport roller 1 (finisher section) |
| :--- | :--- | :--- | :--- |
| $[3]$ | FNS entry roller 1 (finisher section) | $[4]$ | FNS entrance sensor (PS34: finisher section) |
| $[5]$ | FNS entry roller 2 (finisher section) | $[6]$ | Location of loop creation |
| $[7]$ | Transport roller 2 (finisher section) | - | - |

## (2) 1st folding downstream from the FNS middle sensor

- The folding guide motor drives to lower the folding clip and transport the paper downward.
- At the same time, the transport roller rotates in reverse to transport paper downward.
- The transport roller 2 and the Z-fold roller drive to fold paper that has been transported downward.
[1] [2]

[4]
[3]

| $[1]$ | Transport roller 1 (finisher section) | $[2]$ | Folding claw |
| :--- | :--- | :--- | :--- |
| $[3]$ | Z-fold roller | $[4]$ | Transport roller 2 (finisher section) |

[1]
[2]

| [1] Folding claw | [2] |
| :--- | :--- |

### 11.3.2 2nd folding mechanism

(1) 2 nd folding

- 2 nd folds are performed with the transport roller and folding guide.
- The folding guide drives to support the 2nd folding process. The 2nd folding is performed with the transport roller.
- The transport roller rotates counterclockwise, and the Z-fold roller rotates clockwise.

[4]
[3]

| $[1]$ | Transport roller 1 (finisher section) | $[2]$ | Folding guide |
| :--- | :--- | :--- | :--- |
| $[3]$ | Z-fold roller | $[4]$ | Transport roller 2 (finisher section) |

[1]

## [1] Folding guide

## (2) Transport

- The Z-folded paper is transported to the finisher.
- When the Z-folded paper is transported, the folding guide returns to the home position at the same time.

[3]

| $[1]$ | Transport roller 1 (finisher section) | $[2]$ | Folding guide |
| :--- | :--- | :--- | :--- |
| $[3]$ | Transport roller 2 (finisher section) | - | - |

### 11.3.3 Double-folding mechanism

- A mechanism to double-fold paper for which a Z-fold cannot be performed is provided.
- When the paper has a size of $8-1 / 2 \times 14$, selecting Z-fold on the control panel will result in paper being double-folded instead of Z-folded.
(1) Transport roller downstream from the paper transport (Z-fold roller)
- When the double-fold operation starts, the folding guide motor is driven to lower the folding claw.
- Paper that is transported to the finisher is transported to the transport roller and Z-fold roller by the lowered folding claw.
[1]

[3]
[2]

| $[1]$ | Folding claw | $[2]$ | Z-fold roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Transport roller 2 (finisher section) | - | - |

## (2) Paper transport downstream from the double-fold section

- 2nd folding is performed with the transport roller and folding guide.
- The folding guide drives to support the 2 nd folding process. The $2 n d$ folding is performed with the transport roller.
- Control equivalent to that for the 2nd folding mechanism is performed.

[3]

| $[1]$ | Transport roller 1 (finisher section) | $[2]$ | Folding guide |
| :--- | :--- | :--- | :--- |
| $[3]$ | Transport roller 2 (finisher section) | - | - |

### 11.3.4 Transport roller pressure change

- The transport roller in the finisher transports paper during the Z-fold process. In this scenario, the normal transport roller pressure may be too weak to produce folds reliably.
- The transport roller pressure can be changed to enable reliable production of folds.
- Rotation of the pressure cam that is installed in the Z-fold unit moves the transport roller 1 vertically. This movement changes the transport roller pressure via the pressure spring.
- The pressure motor drives the pressure cam. The press home sensor controls the position of the pressure cam.

| $[1]$ | Pressure motor (M502) | $[2]$ | Pressure cam /R |
| :--- | :--- | :--- | :--- |
| $[3]$ | Pressure spring /R | $[4]$ | Transport roller 1 (finisher section) |
| $[5]$ | Pressure cam /F | $[6]$ | Pressure spring/F |
| $[7]$ | Transport roller 2 (finisher section) | $[8]$ | Press home sensor (PS502) |

### 11.3.5 Z-fold pressure release mechanism

- A Z-fold roller pressure release mechanism is provided to enable the removal of jams in the Z-fold unit.
- Operation of the pressure release lever rotates the cam is rotated, and thus releases the Z-fold roller from the transport roller 2 in the finisher.

| $[1]$ | Z-fold roller | $[2] \quad$ Pressure release lever |
| :--- | :--- | :--- |

| $[1]$ | Before release | $[2]$ | After release |
| :--- | :--- | :--- | :--- |
| $[3]$ | Z-fold roller | $[4]$ | Pressure release cam |
| $[5]$ | Pressure release lever | - | - |

### 11.3.6 Z-fold paper detection

- The upper limit sensor detects the Z-folded paper.
- When paper is discharged from the Z-fold section, the thickness of paper is different at the leading edge and trailing edge. The main tray upper sensor in the finisher cannot detect the Z-folded area. For this reason, the Z-folding upper limit sensor detects paper thickness (height).
- The main tray is lowered in accordance with the paper thickness (height).
- The upper limit sensor only makes detections for paper that is discharged from the Z-fold section. For normal paper discharge scenarios (including staple and punch operations), the finisher main tray upper sensor detects paper for the main tray.
- Four sensors are installed in the upper limit sensor, and the thickness (height) of the paper can be detected depending on the paper size.

| $[1]$ | Main tray | $[2]$ | Upper limit sensor1 (PS503) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Upper limit sensor2 (PS504) | $[4]$ | Upper limit sensor3 (PS505) |
| $[5]$ | Upper limit sensor4 (PS506) | $[6]$ | Main tray lift up detection sensor/R (PS17: finisher <br> section) |

| $[7]$ | Main tray lift down detection sensor/R (PS15: finisher <br> section) | [8] | Main tray lift down detection sensor/F (PS14: finisher <br> section) |
| :--- | :--- | :--- | :--- |
| $[9]$ | Main tray lift up detection sensor/F (PS16: finisher <br> section) | - | - |

## 12. PI-507

### 12.1 Configuration

- No control operation is performed for the upper tray.
- The detail of the post inserter section is explained with lower tray

| $[1]$ | Transfer clutch /Lw (CL202) | $[2]$ | Pick-up roller/Lw |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper feed roller /Lw | $[4]$ | Tray upper limit sensor /Lw (PS209) |
| $[5]$ | Paper entrance sensor /Lw (PS206) | $[6]$ | Upper door open/close switch (MS205) |
| $[7]$ | Pl operation board (PIOB) | $[8]$ | Separation roller /Lw |
| $[9]$ | Paper empty sensor /Lw (PS207) | $[10]$ | Paper size VR /Lw (VR202) |
| $[11]$ | Paper set sensor /Lw (PS208) | $[12]$ | L size sensor /Lw (PS212) |
| $[13]$ | Tray lift motor /Lw (M202) | $[14]$ | Transfer motor (M203) |
| $[15]$ | Pl drive board (PIDB) | - | - |

### 12.2 Drive

| $[1]$ | Pick-up roller/Lw | $[2]$ | Paper feed roller /Lw |
| :--- | :--- | :--- | :--- |
| $[3]$ | Pick-up solenoid /Lw (SD202) | $[4]$ | Transport roller |
| $[5]$ | Separation roller /Lw | $[6]$ | Tray lift shaft/Lw |
| $[7]$ | Tray lift motor /Lw (M202) | $[8]$ | Transfer motor (M203) |

### 12.3 Operation

### 12.3.1 Tray lift mechanism

- The tray lift motors /up and /Lw move up and down the trays /Lw by rotating in the forward and reverse direction to drive the lift arms /Lw and move up and down the lift plates /Lw, respectively.
- At the upper limit position of the tray, the tray upper limit sensors /Lw detect the actuators lifted up by the lift plates.
- At the lower limit position of the tray, the tray lower limit sensors /Lw detect the actuators coupled with the lift arms /Lw.

| $[1]$ | Tray lift motor/Lw (M202) | $[2]$ | Tray lower limit sensor/Lw (PS210) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Actuator /Lw | $[4]$ | Tray upper limit sensor/Lw (PS209) |
| $[5]$ | Tray lift plate/Lw | - | - |

### 12.3.2 Pick-up mechanism

- The pick-up solenoids /Lw turn ON to pick up the paper
- The release arm held upward by the spring lifts up the pick-up roller mounting plate to release the pick-up roller.
- When the pick-up solenoids /Lw turn ON, the release arm moves backward, and then the pick-up roller mounting plate and the pickup roller fall down by their own weight
- The pick-up roller driven by the transfer motor presses the paper and picks it up to transfer it to the separation section.

| $[1]$ | Release arm/Lw | [2] | Pick-up solenoid /Lw (SD202) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Pick-up roller/Lw | - | - |

### 12.3.3 Separation mechanism

- The separation roller is driven to rotate in the opposite direction from the paper transfer direction. When transferring no or 1 sheet of paper, the separation roller rotates in the paper transfer direction to transfer the paper to the paper transfer section because the frictional force between the paper feed roller or the paper and the separation roller is stronger than the frictional force of the torque limiter.
- When transferring 2 or more sheets of paper, the separation roller rotates in the reverse direction to prevent the bottom sheet from being transferred because the frictional force between the sheets is smaller than the frictional force of the torque limiter.

| $[1]$ | Paper feed roller | $[2]$ | Paper transfer direction |
| :--- | :--- | :--- | :--- |
| $[3]$ | Torque limiter | $[4]$ | Separation roller |
| $[5]$ | Second sheet | $[6]$ | First sheet |
| $[7]$ | Pick-up roller | - | - |

### 12.3.4 Path switching mechanism

- A path switching mechanism is provided to transport paper to the saddle unit when tri-folding or booklet is selected from the post inserter section.
- When the normal switchback operation is performed, pages can become misaligned. For this reason, a transport path mechanism is provided to transport paper to the saddle unit.
- The transport path is changed with the Z-folding unit if the Z-folding unit is installed as option. If the Z-folding unit is not installed, the path switching assy that is supplied with the post inserter is required
- When the tri-folding or the booklet function is selected from the post inserter, the folding guide motor is driven to lower the folding clip.
- Paper that is transported to the finisher is transported to the transport roller and Z-fold roller by the lowered folding clip. Paper is then transported to the saddle unit
NOTE
- The dedicated the transport roller drive motor(M204) is required for the finisher when the post inserter is installed.
- At time of set-up, make sure to replace the ZU transport motor (M21) that is attached to the finisher with the supplied the transport roller drive motor(M204). However, it is not necessary to install the transport roller drive motor(M204) if the Z-folding unit is already installed.
[1]

[3]

## [2]

| $[1]$ | Folding claw | $[2]$ | Z-fold roller |
| :--- | :--- | :--- | :--- |
| $[3]$ | Transport roller 2 (finisher section) | - | - |

### 12.3.5 Paper size detection control

- The paper size VR /Lw coupled with the side guide detects the paper size in the main scan direction.
- The paper set sensors /Lw and the $L$ size sensor /Lw detects the paper size in the sub scan direction.

| $[1]$ | Paper size VR /Lw (VR202) | $[2]$ | Paper set sensor /Lw (PS208) |
| :--- | :--- | :--- | :--- |
| $[3]$ | L size sensor /Lw (PS212) | - | - |

### 12.3.6 Door open/close detection mechanism

- The upper door open/close switch is installed in the lower-front of the post inserter to detect open/close states of the door.
- Open the door, the warning screen will display on the control panel. All the setting operations and jobs are disabled while the warning screen is displayed. The printing job is interrupted, and the paper being transported causes paper misfeed. The warning screen can be cancelled by closing the door.

[1] Upper door open/close lever
[2] Upper door open/close switch (MS205)

13. JS-602

### 13.1 Configuration

| $[1]$ Job tray | [2] | Job separator cover |
| :--- | :--- | :--- |

13.2 Drive

| $[1]$ | Job separator exit roller | $[2]$ | Entrance switching solenoid (SD401) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Sub tray discharge motor (M18: finisher section) | $[4]$ | Job separator transport roller |

### 13.3 Operation

### 13.3.1 Job tray transport mechanism

- The sub tray discharge motor in the finisher drives to rotate the job separator transport roller and job separator exit roller to transport paper to the tray.
- At the sub tray/JS route change gate, change of the transport path to the job tray is performed.
- The sub tray discharge motor of finisher drives to move the sub tray/JS route change gate horizontally to switch between the paper paths. Therefore the entrance switching solenoid is not used.

| $[1]$ | Job tray paper exit sensor (PS402) | $[2]$ | Entrance switching solenoid (SD401) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Sub tray discharge motor (M18: finisher section) | $[4]$ | Sub tray/JS route change gate home sensor (PS23: <br> finisher section) |
| $[5]$ | Paper | $[6]$ | Route change gate |
| $[7]$ | Job separator transport roller | $[8]$ | Job separator exit roller |

### 13.3.2 Door open/close detection mechanism

- The job tray door sensor is installed in the rear of the job separator section to detect open/close states of the door.
- When the job tray door is opened, a warning screen appears on the control panel. All the setting operations and jobs are disabled while the warning screen is displayed. The printing job is interrupted, and the paper being transported causes paper misfeed. The warning screen can be cancelled by closing the door.

1. AU-102

### 1.1 Configuration

[1]

| $[1]$ | Authentication unit (AU-102) | $[2]$ | Finger |
| :--- | :--- | :--- | :--- |
| $[3]$ | Vein image | - | - |

### 1.2 Operation

- A finger vein pattern is used for personal identification.
- Vein patterns are inside the body and cannot be visually recognized. This makes vein patterns extremely difficult to forge or falsify. The vein pattern authentication system can provide high security.
- With ultra-red LED radiation, a finger vein pattern is captured by camera and its image is created. The vein pattern image is registered and a person can be identified if the person's vein pattern matches the registered one at the time of user authentication.

## 2. AU-201S

### 2.1 Configuration

| $[1]$ | Non-contact IC card | $[2]$ | Read-write area |
| :--- | :--- | :--- | :--- |
| $[3]$ | Status LED | $[4]$ | USB connector (Type-A) |

- Use the Local Interface Kit EK-608/EK-609 and the Installation Kit MK-735 to attach the authentication device inside the main unit.

### 2.2 Operation

- Place the non-contact IC card on the authentication device to read and write data.
- Displays the operational status via LEDs on the unit.
- Yellow-green light glows: Normal operation.
- Red light or orange light is on: Unit is experiencing an issue.

### 2.3 Specifications

| Communication Type | TypeA/Mifare | TypeB | FeliCa |

| Inter-terminal Communication |  |  |  |

PN THEORY OF OPERATION EK-608/EK-609/SC-508

## 1. EK-608

### 1.1 Configuration

| $[1]$ | USB terminal (extension) | $[2]$ | USB terminal (standard) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Local Interface Kit EK-608 | $[4]$ | Voice guidance output terminal |

### 1.2 Operation

- The document can be printed directly from, or saved in, the USB memory.
- Connecting the USB keyboard (dealer option: overseas market only) will permit keyboard input.
- To use the voice guidance function, i-Option LK-104 v3 and Upgrade Kit UK-211 are required.

## 2. EK-609

### 2.1 Configuration

| $[1]$ | USB terminal (extension) | $[2]$ | USB terminal (standard) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Local Interface Kit EK-609 | $[4]$ | Voice guidance output terminal |

### 2.2 Operation

- The document can be printed directly from, or saved in, the USB memory.
- Connecting the USB keyboard (dealer option: overseas market only) will permit keyboard input.
- The local interface kit is mounted when the voice guidance function, and functions interacting with the portable phone or PDA (portable data terminal), compatible with Bluetooth, are to be used. It has a built-in speaker and Bluetooth communication receiver.
- To use the voice guidance function, i-Option LK-104 v3 and Upgrade Kit UK-211 are required.

| $[1]$ | Portable phone, PDA | [2] $\quad$ Local Interface Kit EK-609 |
| :--- | :--- | :--- | :--- |

3. SC-508

### 3.1 Configuration

[1] Security Kit SC-508 * $\quad$ -

## NOTE

- *: It is necessary to install two security kits to the machine for each front side scanning and back side scanning.

### 3.2 Operation

- The security kit offers the copy guard (copy prohibited) and password copy functions in addition to the conventional copy protect function. The copy guard security pattern or password copy security pattern printed on the original, is detected to thereby prevent unauthorized copies from being produced.
- The copy guard security pattern and password copy security pattern can be detected only by the Konica Minolta machine mounted with the copy guard and password copy functions.

## PO THEORY OF OPERATION UK-212/UK-215

1. CONFIGURATION

### 1.1 Mounting position

UK-212

| $[1]$ | Upgrade kit (UK-212) | - |
| :--- | :--- | :--- |

UK-215

[1]
[1] Upgrade kit (UK-215)

## 2. OPERATION

### 2.1 Outline

When the Upgrade kit (UK-212/UK-215) is installed, the following functions can be added:

- Connect the MFP main unit as a wireless LAN adapter to a wireless LAN access point connected to the LAN environment, a job can be executed. The MFP main unit can be connected to both a wireless LAN environment and a LAN environment. (Wireless Only, Wired +Wireless (Secondary Mode))
- Direct communication between the MFP main unit and the mobile device (Android device, iOS device or Wi-Fi support devices) will be enabled. (Wired+Wireless (Primary Mode)*, Wired+Wireless (Wi-Fi Direct))
- Even when the MFP main unit is at standby in "Erp Auto Power Off" mode, a client can start the machine to execute a job.

Basic concept of connection
[1]

| [1] | LAN environment | [2] | Job received from a PC connected to the LAN environment |
| :---: | :---: | :---: | :---: |
| [3] | Job received via the wireless LAN access point | [4] | Wireless LAN access point connected to the LAN environment |
| [5] | Job received from a PC connected to the wireless LAN environment | [6] | Communication with a mobile device connected to the wireless LAN environment *1 |
| [7] | Job received from the MFP main unit via the LAN | [8] | - Communication with the wireless LAN access point (Wireless Only, Wired+Wireless (Secondary Mode)) <br> - Enabled communication with a mobile device (Wired + Wireless (Primary Mode)*, Wired + Wireless (Wi-Fi Direct)) |
| [9] | Job received from the MFP main unit via the wireless LAN | [10] | Communication via the wireless LAN access point connected to a mobile device (Android device, iOS device or Wi-Fi support devices) |
| [11] | Direct communication with a mobile device (Wired + Wireless (Primary Mode)*, Wired + Wireless (Wi-Fi Direct)) | [12] | Machine (on startup) |

## NOTE

- To use UK-212/UK-215, the following settings are required.
[SERVICE MODE] -> [Network Settings] -> [2nd Network Setting]
- The "Interface structure" includes the following five patterns. These patterns can be selected depending on the connection environment of the machine.
[SERVICE MODE] -> [Network Settings] -> [2nd Network Setting] -> [Network Interface Settings]

| No. | Network Interface Settings | Connection environment of MFP main unit |
| :---: | :--- | :--- |
| $\mathbf{1}$ | Wired Only | Use when the machine is connected only to a LAN environment. |
| 2 | Wireless Only | Use when the machine is connected only to a wireless LAN environment. <br> Mode) |
| 4 | Wired+Wireless (Primary Mode) | Use when the machine is connected to both a LAN environment and a wireless LAN <br> environment. |
| Use when the machine is connected to both a LAN environment and a wireless LAN <br> environment. |  |  |
| The machine is used as a wireless LAN access point (Primary Mode). |  |  |

| No. | Network Interface Settings | Connection environment of MFP main unit |
| :---: | :---: | :---: |
| 5 | Wired+Wireless (Wi-Fi Direct) | - Use when the machine is connected to both a LAN environment and a wireless LAN <br> environment. |
|  |  | The machine is used as a wireless LAN access point. <br> A mobile device (excluding iOS) can be connected to Wi-Fi Direct authentication <br> devices easily. |

### 2.2 2nd network interface structure

### 2.2.1 Wired Only

- Use when the machine is connected only to a LAN environment. (Initial setting)
- The LAN line is the main line.
(1) Operation
- To execute a job received from a client via the LAN.

Basic concept of connection
[1]

| $[1]$ | LAN environment | $[2]$ | Job |
| :--- | :--- | :--- | :--- |
| $[3]$ | MFP main unit (on startup) | - | - |

### 2.2.2 Wireless Only

- Use when the machine is connected only to a wireless LAN environment.
- The wireless LAN line is the main line.

## (1) Operation

- To execute a job received from a client via the wireless LAN access point.
- To execute a job received from a PC connected to the LAN.
- To execute a job received from a PC connected to the wireless LAN.
- To execute a job received from an Android device or iOS device (called mobile device hereafter) connected to the wireless LAN.

## NOTE

- A wireless communication is performed between the machine and a client via the wireless LAN access point.

Basic concept of connection

[1] LAN environment $\quad$ [2] Job received from a PC

| [3] Wireless LAN access point | [4] $\quad$ Job received from a mobile device |
| :--- | :--- | :--- |

### 2.2.3 Wired+Wireless (Secondary Mode)

- Use when the machine is connected to both a LAN environment and a wireless LAN environment.
- The LAN line is the main line, and the wireless LAN line is the sub line.

## (1) Operation

- To execute a job received from a client via the LAN.
- To execute a job received from a PC connected to the LAN.
- To execute a job received from a PC connected to the wireless LAN.
- To execute a job received from an Android device or iOS device (called mobile device hereafter) connected to the wireless LAN.
- To execute a job from a client via the wireless LAN access point.
- To execute a job received from a PC connected to the LAN.
- To execute a job received from a PC connected to the wireless LAN.
- To execute a job received from an Android device or iOS device (called mobile device hereafter) connected to the wireless LAN. NOTE
- A communication is performed between the machine and the mobile device via the LAN and wireless LAN access point.

Basic concept of connection
[1]

| $[1]$ | LAN environment | $[2]$ | Job received from a PC |
| :--- | :--- | :--- | :--- |
| $[3]$ | Wireless LAN access point | $[4]$ | Job received from a mobile device |

### 2.2.4 Wired+Wireless (Primary Mode)

- Use when the machine is connected to both a LAN environment and a wireless LAN environment.
- The LAN line is the main line, and the wireless LAN line is the sub line.
- The machine is used as a wireless LAN access point.
- During startup of the machine, perform wireless LAN communication between the machine and the mobile device (Android device, iOS device, or devices supporting Wi-Fi) without via wireless LAN access point.

## (1) Operation

- To execute a job received from a client via the LAN.
- To execute a job received from a PC connected to the LAN.
- To execute a job received from a PC connected to the wireless LAN.
- To execute a job received from a mobile device through a wireless communication.

Basic concept of connection
[1]

| $[1]$ | LAN environment | $[2]$ | Job received from a PC |
| :--- | :--- | :--- | :--- |
| $[3]$ | Job received from a mobile device | - | - |

### 2.2.5 Wired+Wireless (Wi-Fi Direct)

- This mode performs same control as that with Wired+Wireless (Primary Mode).
- When connected to devices supporting Wi-Fi Direct authentication, connection without settings of SSID and password is enabled.

### 2.3 Operation on ErP Auto Power Off mode

- On ErP Auto Power Off mode, the sub power supply turns off, so that the power consumption is controlled. Touching the power key to start the MFP main unit.
- When the machine without UK-212 or UK-215is switched to ErP Auto Power Off mode, the following operations are disabled. Such as receiving data, fax RX, scanning original, printing, and so on.
- When UK-212 or UK-215is installed, ErP Auto Power Off mode can be released remotely (by starting up the machine). [Setting menu] -> [Administrator settings] -> [Network Settings] -> [Wireless Network Setting]

Diagram of standby state in "ErP Auto Off mode" of the MFP main unit
[1]

| $[1]$ | LAN environment | $[2]$ |
| :--- | :--- | :--- |
| $[3]$ | Client $(\mathrm{PC})$ | $[4]$ |

### 2.3.1 Wired+Wireless (Secondary Mode)

## NOTE

- To awake from the ErP Auto Power Off mode, select [Awake with ARP + Unicast Communication].

1. The machine waits for a startup indication that is sent via the wireless LAN communication.
2. Receive a startup command from a client via the wireless LAN communication without via the wireless LAN access point to start up the machine

- Receiving a startup indication from a PC to start up the MFP main unit.
- Receiving a communication from a mobile device to start up the MFP main unit.

Diagram of startup operation

[1] Startup indication *1
[2] Job received from a mobile device
[3] Machine (on startup)

- *1: To execute a print job, [Wake-On-Lan setting] is required to configure at [Initial settings] of a printer driver.

3. After the machine starts up, execute a job that is received from a client.

- Execute a job received from a PC via the LAN.
- Execute a job received from a PC via the wireless LAN communication.
- Execute a job received from a mobile device via the wireless LAN communication.

Diagram of operation after startup

[1] Job received from a PC
[2] Job received from a mobile device
[3] Machine (after startup)

### 2.3.2 Wired+Wireless (Primary Mode), Wired+Wireless (Wi-Fi Direct)

## NOTE

- To awake from the ErP Auto Power Off mode, select [Awake with ARP + Unicast Communication].

1. The machine waits for a startup indication that is sent via the wireless LAN communication.
2. Receive a startup command from a client via the wireless LAN communication without via the wireless LAN access point to start up the machine.

- Receiving a startup indication from a PC to start up the MFP main unit.
- Receiving a communication from a mobile device to start up the MFP main unit.

Diagram of startup operation

[1] Startup indication *1
[2] Job received from a mobile device
[3] Machine (on startup)

- *1: To execute a print job, [Wake-On-Lan setting] is required to configure at [Initial settings] of a printer driver.

3. After the machine starts up, execute a job that is received from a client.

- Execute a job received from a PC via the LAN.
- Execute a job received from a mobile device through a direct wireless LAN communication.

Diagram of operation after starting up the MFP main unit

[1] Job received from a PC
[2] Job received from a mobile device
[3] Machine (on startup)

- After the machine starts up, the wireless LAN communication between the machine and the wireless LAN access point will be completed.

### 2.3.3 Setting for printer driver

- To execute a print job, property settings are required for the printer driver to start up the MFP main unit from ErP Auto Power Off mode.

## (1) Setting procedure

1. Open the property window of the printer.

2. Select the [Initial settings] tab, and select [Wake-On-Lan setting].

3. Select the [Awake before print from Power Saving Mode] check box.

## PP THEORY OF OPERATION FK-514/FK-515/MK-742

## 1. COMMUNICATION CONTROL

### 1.1 FIF bits of DIS, DTC and DCS

## NOTE

- Considered to be A4 width when the DIS recording paper width is invalid (1, 1).

Becomes a FIF error when the DCS recording paper width is invalid (1, 1).

- Considered to be unlimited when the DIS recording paper length is invalid $(1,1)$. Considered to be unlimited when the DCS recording paper length is invalid $(1,1)$. The DCS recording paper length in a machine is made to be of the same length as that in a remote station and is sent.
- Considered to be 2400 bps when the DIS transmission speed is an undefined value. Becomes a FIF error when the DCS transmission speed is an undefined value.
- Considered to be 40 ms instruction when the MSLT of DCS is an undefined value.
- Considered to have mm ability when DIS inch ability and mm ability are both set to OFF.

Considered to be $200 \times 100$ pels/inch when the DCS resolution receives the inch instruction at $3.85 \mathrm{I} / \mathrm{mm}$.
Becomes a FIF error when more than one of bit41, 42 and 43 are set to on in the resolution of DCS.

- Becomes a FIF error when DCS receives the MMR instruction without ECM.
- Becomes a FIF error when DCS receives the file transfer (BFT) instruction without ECM.
- Becomes a FIF error when DCS shows an instruction which exceeds the ability of the machine.
- FIF of DIS/DTC is not sent if last octet is 0 .

DCS sends FIF whose length is the same as that of the machine.

- When undefined signals are received, they are received and ignored in consideration of the future expansion. (not an error)

### 1.1.1 FIF data configuration list (DIS/DTC)

(1) Octet 4

| bit | Function | Contents | Default |
| :---: | :--- | :--- | :---: |
| 1 | T.37 Internet fax (Simple mode) |  | 0 |
| 2 | Reserved |  | 0 |
| 3 | T.38 real time Internet fax |  | 0 |
| 4 | Third generation mobile network |  | 0 |
| 5 | Reserved | $1: 64$ octet | 0 |
| 6 | V.8 ability | $0: 256$ octet | 0 |
| 7 | ECM frame |  | 0 |
| 8 | Reserved |  | 0 |

(2) Octet 5

| bit | Function | Contents | Default |
| :---: | :---: | :---: | :---: |
| 9 | Ready for polled transmission | 1: polled transmission documents exist 0: no polled transmission documents | @ |
| 10 | Receiver ability | 1: Reception is possible. 0: Reception is impossible. | @ |
| 11 | Transmission speed ability | Refer to *1. | 1 |
| 12 |  |  | 1 |
| 13 |  |  | 0 |
| 14 |  |  | 1 |
| 15 | $\mathrm{R} 8 \times 7.7 \mathrm{l} / \mathrm{mm}$ and/or $200 \times 200$ pels/25.4 mm |  | 1 |
| 16 | Two-dimensional coding ability | $\begin{array}{\|l\|} \text { 1: } \mathrm{MR} \\ \text { 0: } \mathrm{MH} \end{array}$ | 1 |

- @: Changes to 0 or 1 according to a status of devices.
- *1: Transmission speed ability (bit 11, 12, 13 and 14)

| 11 | 12 | 13 | 14 | Contents | Transmission speed |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | 0 | 0 | 0 | V27 ter fall back mode | 24 |
| 0 | 1 | 0 | 0 | V27 ter | 48,24 |
| 1 | 0 | 0 | 0 | V29 | 96,72 |
| 1 | 1 | 0 | 0 | V27 ter \& V29 | $96,72,48,24$ |

### 1.2 Modem fallback sequence

- Fallback sequences of TCF and CTC are shown as follows:

### 1.2.1 V17, V29, and V27 ter

| Ability of a remote station | TCF fallback sequence |
| :--- | :--- |
| V27 ter/V29 | $96 / \mathrm{V} .29$-> 72/V.29 -> 48/V.27 ter -> 24/V27 ter |
| V27 ter/V29/V33 V17 | 144/V.17 -> 120/V.17 -> 96/V.17 -> 72/V.17 -> 48/V.27 ter -> 24/V27 ter |

- On the transmission side: If PPR is received four times, a modem is set in the fallback state.
- On the reception side: In case of sending PPR, when the number of error frames exceeds the FP value, a modem is set in the fallback state.

### 1.2.2 V34 fallback

- Line quality is always water by modem. Optimum speed is automatically selected on-the-fly.

### 1.3 V8/V34 sequence

### 1.3.1 V34

(1) Outline

- The 33.6 kbps data transmission method and protocol including the V8 protocol. As for each of full-duplex and half-duplex, startup handshake until data transmission starts is divided into four phases, phase1 to 4 , and signals used in each phase are regulated.

## (2) Features

- Full-duplex (echo canceler method) / Half-duplex method are regulated (for data / FAX respectively)
- 2400, 3000 and 3200 symbols / sec (mandatory) and 2743, 2800 and 3429 symbols / sec (option) QAM synchronous transmission at each symbol rate
- Communication at each signal rate of 33600, 31200, 28800, 26400, 24000, 21600, 19200, 16800, 14400, 12000, 9600, 7200,4800 and 2400 bps
- Four-dimensional-symbol trellis coding
- A 200bps sub channel which can be used as an asynchronous second channel (option)
- Negotiation in which characteristics of a line is measured before transmission starts and the maximum communication speed is achieved by finely adjusting the transmission parameter, based on the result of measurement (carrier / frequency / equalizer / symbol rate / level, etc.)
- Data transmission in the super frame with the hierarchical structure

### 1.3.2 Sample of a signal procedure at sending two pages

(1) Beginning of communications to beginning of 1st page transmission

(2) Signals between pages

(3) 2nd page transmission termination to communication termination

Note - Some terminals may disconnect the line immediately after sending DCN without sending consecutive 1s

### 1.3.3 Procedure details

(1) Phase 1 (V8) ....Beginning of connection between a calling modem and a called modem

- *1: One of no signals / C1 / CNG (T.30) / CT (V.25)
- *2: V. 34 full-duplex ability in the modulation mode bit is ON
- *3: ANSam of phase inversion is sent. Phase inversion is an option in case of supporting only half-duplex. When CM or valid signal from the calling side is not detected, the procedure is moved to T .30 , etc. after $75 \pm 5 \mathrm{~ms}$ interval.
(a) Signal Definition

| Signal type | Meaning | Signal direction call called | Signal speed | Timing of transmission |
| :---: | :---: | :---: | :---: | :---: |
| Cl (Call Indicator) | Function display on the calling side | -> | $\begin{gathered} \text { V21(L) (300 } \\ \text { bps) } \end{gathered}$ | - Start: after 0.4 seconds after line connection from ON condition (in the following format) <br> - Stop: when 3 period or more has passed after ANSam / ANS is detected |
|  | [Comments] <br> - Cl is a signal to carry call function. <br> - The calling side send CI, CT (Call Tone - V25) or CNG. <br> - Cl transmission and detection are optional. <br> - The ON minimum time ( $=3$ Period) is of duration of three Cl signals in the following format. |  |  |  |
| ANSam (Modified Answer Tone) | V .8 procedure on the called side Support display | <- | - | When 0.2 seconds or more has passed after reception |
|  | [Comments] <br> - Essential for a called machine which supports the V8 procedure. <br> - 2100 Hz sine wave is phase-inverted by $400+/-25 \mathrm{~ms}$ periods, then amplitude modulated by $15+/-0.1 \mathrm{~Hz}$ sine wave <br> - Average value of modulation factor ( x ) $0.8+/-0.01<x<1.2+/-0.01$ <br> - Average transmission power compliant to V2 <br> - $2100+/-200 \mathrm{~Hz}$ external power is smaller than the average power by 24 dB or more. |  |  |  |
| CM (Call Menu) | Modulation mode etc. on the calling side | $\begin{gathered} -> \\ (300 \mathrm{bps}) \end{gathered}$ | V. 21 (L) | - Start: Te ( $0.5 \mathrm{sec} . \leq \mathrm{Te} \leq 1 \mathrm{sec}$.) has passed after Cl transmission stops <br> - Stop: When two or more JM are detected |
|  | [Comments] <br> - CM is a signal which carries call function, modulation modes, protocols and GSTN access. <br> - The first information category is call function. <br> - Protocols and GSTN access category are added when the calling side has ability and when needed to inform to a remote station. |  |  |  |
| CJ | CM termination | $\begin{gathered} -> \\ (300 \mathrm{bps}) \end{gathered}$ | V. 21 (L) | When CM is completed |
|  | [Comments] <br> - START bit (0) and STOP bit (1) are added to 1 octet of all bit 0 . |  |  |  |
| JM (Joint Menu) | Display of common ability on both calling and called sides | (300 bps) | V. 21 (H) | - Start: When two or more same CM are received <br> - Stop: When CJ is received or receives a signal matching the selected Modulation Mode from the calling side |
|  | [Comments] <br> - JM is a response signal to CM and of the same format as the received CM. <br> - The fist information category is Call Function as same as CM. <br> - Modulation mode sets the common bit on calling and called sides and sends by the same octet as received CM. <br> - When there is no common ability, all bits are set to 0 and send by the same octet as received CM. <br> - The minimum item No. is selected from the common bits to determine the actual Modulation Mode. <br> - Protocol is added when it is included in received CM and needed to instruct. <br> - GSTN access is added when it is included in received CM and needed to instruct. <br> - Bit 6 is set to ON when needed to show ability. Bit 5 is set to the same one as received CM. |  |  |  |

## (b) Signal format

1. Preamble: a signal added before each signal when $\mathrm{CI}, \mathrm{CM}$ and JM signals are sent.

- Format: $1111111111+0000000001$ (for CI)
- Format: 1111111111 +0000001111 (for CM and JM)

2. Common format among each signal $\mathrm{CI}, \mathrm{CM}$ and JM

- Start Bit $(=0)$ is put at the top and Stop Bit $(=1)$ is put at the end of each octet.

- (1): Category tag (tags which represent information types)

| Bit assignment |  |  |  |  | Meaning (information type) |  |
| :---: | :---: | :---: | :---: | :---: | :--- | :--- |
| b0 | b1 | b2 | b3 |  |  | Top of CM, JM / CI |
| 1 | 0 | 0 | 0 | $\ldots$ | Call Func | CM/JM |
| 1 | 0 | 1 | 0 | $\ldots$ | Modulation Mode | CM/JM |
| 0 | 1 | 0 | 1 | $\ldots$ | Protocols | CM/JM |
| 1 | 0 | 1 | 1 | $\ldots$ | GSTN access | CM/JM |
| 0 | 1 | 1 | 0 | $\ldots$ | PCM modem ability |  |

- (2): Option bit (Differs depending on category tags. See "PP.1.3.4 Common signal bit definition".)
- (3): Additional option bit (Differs depending on category tags. See "PP.1.3.4 Common signal bit definition".)

### 1.3.4 Common signal bit definition

(1) Call function (1 octet)
(a) Top octet

| b0 | b1 | b2 | b3 | b4 | b5 | b6 | b7 | Meaning |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 0 | 0 | 0 | 0 |  |  |  | (Call Function category tag) |
|  |  |  |  |  | 0 | 0 | 0 | Defined by ITU-T |
|  |  |  |  |  | 1 | 0 | 0 | PSTN multi-media terminal |
|  |  |  |  |  | 0 | 1 | 0 | V18 text phone |
|  |  |  |  |  | 1 | 1 | 0 | Video tex |
|  |  |  |  |  | 0 | 0 | 1 | FAX transmission from the calling terminal |
|  |  |  |  |  | 1 | 0 | 1 | FAX reception in the calling terminal |
|  |  |  |  |  | 0 | 1 | 1 | Data transmission / reception |
|  |  |  |  |  | 1 | 1 | 1 | Expansion octet = with call function represented by next octet |

- (Other than the above $=$ Reserved $)$
(2) Modulation mode (3 octets)
(a) 1st octet

| b0 | b1 | b2 | b3 | b4 | b5 | b6 | b7 | Meaning | Item No. |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 0 | 1 | 0 | 0 |  |  |  | (Modulation mode category tag, b4 = 0 is first octet) |  |
|  |  |  |  |  | 0/1 |  |  | PCM modem ability disabled/enabled |  |
|  |  |  |  |  |  | 0/1 |  | V34 full-duplex ability disabled/enabled | 1 |
|  |  |  |  |  |  |  | 0/1 | V34 half-duplex ability disabled/enabled | 2 |

(b) 2nd octet

| b0 | b1 | b2 | b3 | b4 | b5 | b6 | b7 | Meaning | Item No. |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | 0 | 1 | 0 |  |  | (b3, 4 and 5=0, 1, 0 means expanded oct.) |  |
| 0/1 |  |  |  |  |  |  |  | V32 bis / V32 ability disabled / enabled | 3 |
|  | 0/1 |  |  |  |  |  |  | V22 bis / V22 ability disabled / enabled | 4 |
|  |  | 0/1 |  |  |  |  |  | V17 ability disabled / enabled | 5 |
|  |  |  |  |  |  | 0/1 |  | V29 half-duplex ability disabled / enabled (used in T.30) | 6 |
|  |  |  |  |  |  |  | 0/1 | V27 ter ability disabled / enabled | 7 |

## (c) 3rd octet

| b0 | b1 | b2 | b3 | b4 | b5 | b6 | b7 | Meaning | Item No. |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | 0 | 1 | 0 |  |  | (b3, 4 and 5=0, 1, 0 means expanded oct.) |  |
| 0/1 |  |  |  |  |  |  |  | V26 ter ability disabled / enabled | 8 |
|  | 0/1 |  |  |  |  |  |  | V26 bis ability disabled / enabled | 9 |

| b0 | b1 | b2 | b3 | b4 | b5 | b6 | b7 | Meaning | Item No. |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 0/1 |  |  |  |  |  | V23 full-duplex ability disabled / enabled | 10 |
|  |  |  |  |  |  | 0/1 |  | V23 half-duplex ability disabled / enabled | 11 |
|  |  |  |  |  |  |  | 0/1 | V21 ability disabled / enabled | 12 |

(3) Protocols (1 octet)

| b0 | b1 | b2 | b3 | b4 | b5 | b6 | b7 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :--- |
| 0 | 1 | 0 | 1 | 0 |  |  |  |  |

- (Other than the above = Reserved)
(4) GSTN access (1 octet)

| b0 | b1 | b2 | b3 | b4 | b5 | b6 | b7 | Meaning |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 0 | 1 | 1 | 0 |  |  |  | (GSTN access category tag) |
|  |  |  |  |  | 0/1 |  |  | Celluler connection in the calling side |
|  |  |  |  |  |  | 0/1 |  | Celluler connection in the called side |
|  |  |  |  |  |  |  | 0/1 | 0: Analog network connection <br> 1: Digital network connection |

(5) PCM modem capability (1 octet)

| b0 | b1 | b2 | b3 | b4 | b5 | b6 | b7 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :--- |
| 1 | 1 | 1 | 0 | 0 |  |  |  |  |

### 1.3.5 Phase 2 (Probing) ..... V. 34 basic setting

- Exchange of modulation ability
- Measurement of line characteristics (bi-direction)
- Determination and exchange of compensation values to line characteristics (compensation values of maximum data rate, transmission level, pre-emphasis (*))
- *: linear equalizer for compensating amplitude distortion

- *1: INFO 0c Bit 28 OFF
- *2: INFO 0a Bit 28 OFF
(1) <INFO 0x Bit Assignment>

| :---: | :---: | :---: | :---: |
| 0-3 | 1111 | Fill Bits |  |
| 4-11 | 01110010 | Bit string for frame synchronization (transmitted from the left side) |  |
| 12-14 | 0 to 7 | - Output reduction width demanded by the reception modem (dB) <br> - When *the modem on the transmitting side can not reduce output* at INFO 0 , the value is set to 0. |  |
| 15-21 | 0 to 127 | The length of TRN which the modem of the transmitting side send in the Phase 3 ( $\times 35 \mathrm{~ms}$ ) |  |
| 22 | 0/1 | High carrier is user for data mode Tx. |  |
| 23-26 | 0 to 10 | Pre-emphasis filer index No.which is used for data transmission |  |
| 27-29 | 0 to 5 | Symbol rate of data transmission | 0: 2400 ... 5: 3429 (symbol / sec) |
| 30 | 0/1 | Selection of parameters used for TRN. | - 0: 4 points <br> - 1: 16 points |
| 31-46 |  | CRC |  |
| 47-50 | 1111 | Fill Bits |  |

### 1.3.6 Phase 3 .....Training of the main channel equalizer

- Band division full-duplex method
- Transmission and reception of Phase 3 signals ( $\mathrm{S}, \overline{\mathrm{S}}^{\mathrm{P}} \mathrm{PP}, \mathrm{TRN}$ ) are executed by using parameter values which are determined by exchanging INF Oh. (symbol rate, carrier frequency, pre-emphasis filter and transmission level)

- The speed of the following signals (Phase 3) are determined by INFOh. (The following signals are used in the main channel in the halfduplex procedure.)

| $S$ | Signal which sends alternately 0 point and a point which rotated 0 point counterclockwise by 90 degrees |
| :--- | :--- |
| $\bar{S}$ | Signal which sends alternately a point which rotated 0 point counterclockwise by 180 degrees and a point which rotated 0 point <br> counterclockwise by 270 degrees |
| PP | Special signal which is sent from a remote station for adjusting an equalizer |
| TRN | Training signal. (Symbol rate and duration are determined in INFOh.) |

## (1) Control channel signal

- The following signals are used for establishing the control channel or re-synchronization and retrain. (peculiar to half-duplex procedure)

| Modulation method | $1200 / 2400$ bps QAM modulation ( $600 \pm 0.01$ symbols / sec). However, training and synchronous signals are 1200 bps. | - Calling modem: Carrier ( $=1200 \mathrm{~Hz} \pm 0.01$ \% (level = set value)) <br> - Called modem: Carrier ( $=2400 \mathrm{~Hz} \pm 0.01$ \% (level = set value-1 dB)) + Guard tone (=1800 Hz $\pm 0.01$ \% (level = set value-7 dB)) |
| :---: | :---: | :---: |
| Sh | Signal which sends alternately 0 point and a point which rotated 0 point counterclockwise by 90 degrees (the same as S ) |  |
| Sh | Signal which sends alternately a point which rotated 0 point counterclockwise by 180 degrees and a point which rotated 0 point counterclockwise by 270 degrees (the same as S) |  |
| AC | Signal which send alternately 0 point and a point which rotated 0 point by 180 degrees |  |
| PPh | Special signal which is sent from a remote station for adjusting an equalizer (used when the initial of the control channel and re-synchronization are executed) |  |
| ALT | Signal which scrambled alternate signals of 0 and 1 (1200 bps) |  |
| MPh | Binary signal used for exchanging parameters of the modulation method when data is actually sent and received by using the main channel (1200 bps) | - Both type 0 and type 1 (type $0+$ pre-recording coefficient) must be received. <br> - When type 0 is received, pre-recording coefficient is considered to be 0 and never functions. |
| E | "1", binary of 20 bit, which represents the beginning of user data transmission on the control channel |  |

(2) MPh (type 0) bit assignment

| Bits (LSB-MSB) | Value |  | Meaning |
| :---: | :---: | :---: | :---: |
| 0-16 | All bit 1 | Bit string for frame synchronization |  |
| 17 | 0 | Start bit |  |
| 18 | 0 | MP signal type |  |
| 19 | 0 | Reserved |  |
| 20-23 | 1 to 14 | Maximum transmission rate from the callin | modem to the called modem (x 2400) *1 |
| 24-26 | 0,0,0 | Reserved |  |
| 27 | 0/1 | Control channel data transmission rate which is selected by the opposed transmitter | - 0: 1200 bps <br> - 1: 2400 bps |
| 28 | 0 | Reserved |  |
| 29-30 |  | Trellis coding device selection *2 | - 00: 16 state <br> - 10: 32 state <br> - 01: 64 state <br> - 11: Reserved |
| 31 | 0/1 | Non-linear encoder parameter selection for the terminal transmitter of a remote station *2 | - $0: \varphi=0$ <br> - 1: $\varphi=0.3125$ |
| 32 | 0/1 | Parameter (shaping) selection when the data rate is determined within each symbol rate *2 | - 0: Minimum <br> - 1: Expanded |
| 33 | 0 | Reserved |  |
| 34 | 0 | Start bit |  |
| 35-49 |  | Communication speed mask (Bit $35=2400 \mathrm{bps} .$. Bit $46=28.8 \mathrm{kbps}$, Bit $47=31.2 \mathrm{kbps}$, Bit $48=33.6 \mathrm{kbps}$ and Bit 49=Reserved) | - 0 : Ability of both modems disabled <br> - 1: Enabled |
| 50 | 0/1 | Use of control channel imbalance data rate | - 0: No <br> - 1: Yes |
| 51 | 0 | Start bit |  |
| 52-67 | 0 | Reserved |  |
| 68 | 0 | Start bit |  |
| 69-84 |  | CRC |  |
| 85-87 | 0,0,0 | Fill Bits |  |

- *1: 13 and 14 are used when the opposed modem supports up to 1664 points
- *2: Set to 0 on the transmitting modem.

## (3) MPh (type 1) bit assignment

| Bits (LSB-MSB) | Value |  | Meaning |
| :---: | :---: | :---: | :---: |
| 0-16 | All bit 1 | Bit string for frame synchronization |  |
| 17 | 0 | Start bit |  |
| 18 | 1 | MP signal type |  |
| 19 | 0 | Reserved |  |
| 20-23 | 1 to 14 | Maximum transmission rate from the calling modem to the called modem (x 2400)*1 |  |
| 24-26 | 0,0,0 | Reserved |  |
| 27 | 0/1 | Control channel data transmission rate which is selected by the opposed transmitter | - 0: 1200 bps <br> - 1: 2400 bps |
| 28 | 0 | Reserved |  |
| 29-30 |  | Trellis coding device selection *2 | - 00: 16 state <br> - 10: 32 state <br> - 01: 64 state <br> - 11: Reserved |
| 31 | 0/1 | Non-linear encoder parameter selection for the terminal transmitter of a remote station *2 | - $0: \varphi=0$ <br> - 1: $\varphi=0.3125$ |
| 32 | 0/1 | Parameter (shaping) selection when the data rate is determined within each symbol rate *2 | - 0: Minimum <br> - 1: Expanded |
| 33 | 0 | Reserved |  |
| 34 | 0 | Start bit |  |
| 35-49 |  | Communication speed mask (Bit $35=2400 \mathrm{bps} .$. Bit 46=28.8 kbps, Bit $47=31.2 \mathrm{kbps}$, Bit $48=33.6 \mathrm{kbps}$ and Bit 49=Reserved) | - 0: Ability of both modems disabled <br> - 1: Enabled |
| 50 | 0/1 | Use of control channel imbalance data rate | - 0: No <br> - 1: Yes |
| 51 | 0 | Start bit |  |
| 52-67 |  | Pre-coding coefficient h (1) Real |  |
| 68 | 0 | Start bit |  |
| 69-84 |  | Pre-coding coefficient h (1) Imaginary |  |
| 85 | 0 | Start bit |  |
| 86-101 |  | Pre-coding coefficient h (2) Real |  |
| 102 | 0 | Start bit |  |
| 103-118 |  | Pre-coding coefficient h (2) Imaginary |  |
| 119 | 0 | Start bit |  |
| 120-135 |  | Pre-coding coefficient h (3) Real |  |
| 136 | 0 | Start bit |  |
| 137-152 |  | Pre-coding coefficient h (3) Imaginary |  |
| 153 | 0 | Start bit |  |
| 154-169 |  | Reserved |  |
| 170 | 0 | Start bit |  |
| 171-186 |  | CRC |  |
| 187 | 0 | Fill Bits |  |

- *1: 13 and 14 are used when the opposed modem supports up to 1664 points
- *2: Set to 0 on the transmitting modem.

### 1.3.7 Re-synchronization procedure / Startup procedure

- A procedure required to switch control channel and main channel in the half-duplex procedure
- A procedure which includes another modulation parameter exchanging is especially called the startup procedure. (used for changing the communication speed)

## (1) Startup procedure

- Control channel startup procedure (By exchanging MPh, the communication speed is changed.)
- "Control channel re-synchronization procedure" is not used

## (2) Re-synchronization procedure

- Control channel re-synchronization.
- See signals related to control channels for signal names and change method.

(a) Main channel re-synchronization procedure and Turn-off
- The receiving modem re-synchronizes the main channel by using the PP signal. After B1, starts receiving Primary Data.
- The transmitting modem sends the scrambled 1's for 35 ms after Primary Data transmission has been completed.
- Both modems move to the control channel re-synchronization procedure or the control channel startup procedure.

| S | Signal which sends alternately 0 point and a point which rotated 0 point counterclockwise by 90 degrees |
| :--- | :--- |
| $\bar{S}$ | Signal which sends alternately a point which rotated 0 point counterclockwise by 180 degrees and a point which rotated 0 <br> point counterclockwise by 270 degrees |
| PP | Special for adjusting an equalizer |
| B1 | High-speed signal of one frame length which is sent at the end of a series of startup sequence in the selected modulation <br> parameter. |

### 1.3.8 Other

(1) Minimum reception signal level (RLSD) (half-duplex mode only)

- The reception circuit is turned to ON when the signal becomes 43 dBm or more.
- When the signal becomes 48 dBm or less, the reception circuit is turned OFF within 20 to 25 ms after it has exceeded the thresh old.

## (2) Data frame structure

- All data transmitted in V. 34 (after the Phase 4) is treated in the following frame format.
- J: The number of data frames within one super frame
- $P$ : The number of mapping frames within one data frame

| Modulation Speed | J | P |
| :---: | :---: | :---: |
| 2400 baud | 7 | 12 |
| 2743 baud | 8 | 12 |
| 2800 baud | 7 | 14 |
| 3000 baud | 7 | 15 |
| 3200 baud | 7 | 16 |
| 3429 baud | 8 | 15 |

## 2. FUNCTION

### 2.1 Telephone function

### 2.1.1 TEL/FAX switching

## (1) Outline

- A function to switch telephone and FAX automatically after reception. (Depends on Country spec.)

## (2) Operation

1. When CNG is not detected for 2 seconds (or 4 seconds, following address parameter) after line seizure, this function sends voice response message 1 and continues CNG detection.
2. If voice response 1 is sent and CNG detection is continued for 4 seconds but could not be detected, external ringer is sent to the externally installed phone.
3. When CNG is not detected for a given period (Default is 20 seconds. Changeable by address parameters), this function stops external ringer transmission and becomes fax reception after the voice response message 2 is sent.
4. This function detects OFF-HOOK of the external telephone during external ringer transmission only.
5. When OFF-HOOK of the external telephone is detected during external ringer transmission, the line is connected to the external telephone. Even if you use the telephone, you can manually switch to the fax reception after that
6. When CNG is detected during the above-mentioned external ringer transmission, External ringer transmission is stopped and the fax reception starts.

(3) Related FP

| No. | FP | Meaning and purpose | Address | Value | Default | Note |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | Tel-Fax switching | TEL/FAX switching mode | $\begin{aligned} & \text { 0x0e0095 } \\ & \text { bit5 } \end{aligned}$ | 0: Disabled 1: Enabled | 0 | Those with a Administrator Settings |
| 2 | RBT transmission time | RingBackTone signal transmission time | 0x0e00fc | unit: 1000 ms , HEX | $\begin{aligned} & 0 \times 14(20 \\ & \text { sec.) } \end{aligned}$ | - A serviceman setting by address setting <br> - Those with a Administrator Settings 30 sec . or less: 5 seconds 30 sec. or more: 30 seconds |
| 3 | Tel-Fax switching parameter | Time from vocal response to RBT transmission (CNG detection waiting time 2) | $\begin{aligned} & \text { 0x0e0095 } \\ & \text { bit7 } \end{aligned}$ | $\begin{aligned} & \text { 0: } 4 \text { sec. } \\ & 1: 2 \mathrm{sec} . \end{aligned}$ | 0 | A serviceman setting by address setting |
| 4 | Tel-Fax switching parameter | Time from reception to voice response transmission (CNG detection waiting time 1) | $\begin{aligned} & \text { 0x0e0095 } \\ & \text { bit6 } \end{aligned}$ | $\begin{aligned} & \text { 0: } 2 \mathrm{sec} . \\ & \text { 1: } 4 \mathrm{sec} . \end{aligned}$ | 0 |  |
| 5 | Tel-Fax switching parameter | TEL/FAX switching ON response details | $\begin{aligned} & \text { 0x0e0095 } \\ & \text { bit3 } \end{aligned}$ | $\begin{aligned} & \text { 0: Voice response + RBT } \\ & \text { transmission } \\ & \text { 1: RBT transmission only } \end{aligned}$ | 0 | Those with a Administrator Settings |

### 2.2 F-code

- F-code is a function to realize confidential transmission / bulletin board polling / relay transmission by using SUB, SEP and SID signals.
- To be more specific, a machine which can open "a box" on the memory is called "a F code compliant center machine" and a machine which can access to a center machine by using the F code function is called "a F-code compliant machine." The center machine can have plural "boxes" and they are used as the confidential box, bulletin board box and relay box respectively.
- Function outline is as follows.

| Function | Outline |  | Signals to be used |  |  | Use (Meaning) | Required function |
| :--- | :--- | :---: | :---: | :---: | :---: | :---: | :---: |

| Function | Outline | Signals to be used |  |  | Use (Meaning) | Required function | Remark |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | SUB | SEP | SID |  |  |  |
| Bulletin board polling | By appointing a box No. in the center machine which opens a bulletin board, contents are polled. | $\times$ | $\bigcirc$ | $\times$ | SEP = Appointment of a bulletin board box | - Registration = Message overwriting <br> - With a mode which is not deleted by polling. |  |
| Relay transmission | Requesting relay to the relay machine which opens a relay box (No.) in which a broadcasting transmission remote station is registered. | $\bigcirc$ | $\times$ | $\bigcirc$ | - SUB = Appointment of a relay box (No.) <br> - SID = Password |  |  |

- $O=$ interact is required
- $\Delta=$ selectable
- $x=$ do not use

### 2.2.1 Signal format

## (1) Contents of signals

| Item / Signal Name | SUB/SEP | SID |
| :--- | :--- | :--- |
| Characters | 0 to 9 only (* and \# must not be used.) | • to 9 <br> • * <br> • \# |
| Contents | Box No. | Password |
| No. of digits | Arbitrary between 1 and 20 |  |
| Space between digits | Prohibited |  |
| Others | Impossible to designate more than one box |  |

## (2) FIF (SUB/SEP/SID) common

- The last digit is left-justified. The remaining are filled with space (0x20)
eg.) 12345

(3) DIS/DTC/DCS bit condition

| Bit No. | Meaning | DIS/DTC | DCS |
| :---: | :---: | :---: | :---: |
| 47 | Selective polling ability | - DIS = ON when SEP reception is possible <br> - DTC = ON when SEP is transmitted | 0: fixed |
| 49 | Sub address ability / function | ON when SUB reception is possible | ON when SUB transmission is possible |
| 50 | Password / sender ID | - DIS = ON when SID reception is possible <br> - DTC = ON when SID is transmitted | ON when SID is transmitted |

### 2.2.2 F-code confidential transmission

1. The confidential box is registered in the center machine.

- Registration of confidential box No. and name
- Registration of communication password
- Registration of box password

2. Transmission operation on the transmitting side

- Specification of confidential box No.

3. Reception in the center machine

- Automatic output of confidential communication report

4. Printing in the center machine

- Output by entering an access protect No.

## (1) BOX specifications

| Confidential box No. | • Represented by a nine digit number. Operationally between 1 and 999999999. <br> You can not open the same box number as the bulletin board No. which has been already <br> opened. |
| :--- | :--- |
| Communication password | Possible to use. |
| Confidential BOX name | Possible to resister up to 20 characters. |
| Erased at printing | Erased on every page after output. |
| Box password | Represented by eight digit number between 00000000 and 99999999. |
| No. of files in confidential box | 100 files at the maximum including bulletin board. |

(2) Example of the protocol sequence

### 2.2.3 F-code bulletin board polling

1. Registration of the bulletin board box in the center machine

- Registration of the bulletin board No. and name

2. Storing documents in the bulletin board
3. Operations for polling reception on the compliant machine

- Appointment of bulletin board No.
(1) BOX specifications

| Bulletin board box No. | • Represented by a nine digit number. Operationally between 1 and 999999999. <br> You can not open the same box number as the confidential box which has been already <br> opened. |
| :--- | :--- |
| Bulletin board password | No |
| Bulletin board box name | • Yes <br> - Same number of characters as the confidential box |
| Erased at printing | Not erased when printed. |
| Erased at polling | Not erased when polled. |
| Access protect No. | No |
| No. of document registration to the <br> bulletin board box | Only once. If already exist, it is overwritten. |

(2) Example of protocol sequence

### 2.2.4 F-code relay transmission

NOTE

- This machine is only relay requests and do not function as a relaying station.

1. The relay box is registered in the relaying station.

- Registering relay box No., relay password and relay group No.

2. Registration of group

- Registering final destinations in the group No.

3. Transmission operation in the relay requesting station

- Instructs relay box no. and relay password.

4. Transmission to the final remote stations registered in the group
5. Possible to printed relayed documents on the relaying station (depends on the parameter setting)

## (1) BOX specifications

| Relay box | Possible to register up to 5. |
| :--- | :--- |
| Relay box No. | Any box number that can range between 1 and 999999999 |
| Relay password | Any 8-digit number |
| Relay BOX name | To be assignable |
| Access protect No. | No |
| Final destination designation | Possible only to register in the relay box by appointing the group. |
| File erasure after transfer | Always erased |
| Conditions to erase box by operations | Only when there are no files of received messages in the relay box, box can be erased. |

(2) Protocol sequence example

### 2.3 Transmission function

### 2.3.1 Original scan mode

- The original scan mode is roughly classified by the regular original scan and the irregular original scan.

| Regular original | Irregular original | Mode selection |
| :--- | :--- | :--- |
| Normal mode | Irregular mode | Default setting |
| Mixed original mode |  | Scan setting |

## (1) Scan mode default setting

- The scan mode can be set by [Service Mode] -> [FAX] -> [System] -> [Scan Setting]. The default is the irregular mode.

|  | Paper size detection | Default | Frame erasure |
| :--- | :--- | :--- | :--- |
| Irregular mode | Trailing edge detection | Yes | Trailing edge erasure may not be <br> done. |
| Normal mode | DF paper size sensor | Automatically selected when using the page <br> related application function (book transmission, <br> etc.). | Frame erasure of all sides |

### 2.4 Reception function

### 2.4.1 Reduction / division of reception

- Parameters related to reduction / division are set on the [Administrator Settings] -> [Fax Settings] -> [TX/RX Settings]. There are two parameters as follows:
- [Min. Reduction for RX Print]: 96, 95, 94, ..., 87: a
- [Print Separate Fax Pages]: ON, OFF: b
- The reception recording mode is determined by the above-mentioned parameters, $a$ and $b$.

## (1) Auto reduction reception mode

- a = Don't care (except 100)
- $b=O F F$
- The received documents are automatically reduced in the range of 35 to $96 \%$.
(2) Page division recording reception mode
- a = 96, 95, ... 87
- $b=O N$
- Documents are reduced to three reduction rate ( $90 \%$, $86 \%$, or $82 \%$ ) determined by the width of received documents and the selected recording paper. When they are still larger than a paper size, they are reduced to a value in "a" for the division recording.
- $90 \%$ = Fixed value
- $86 \%, 82 \%=$ Reduction rate determined by the main scanning direction
- The paper selection and division are determined in accordance with the following figure
(3) Paper selected for division printing, magnification
(a) A4S width at reception

| Original | Optimum | Selected paper size / Division operation |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| length $=$ Receive d original size (1/a) |  | Priority 1 | Priority 2 | Priority 3 | Priority 4 | Priority 5 | Priority 6 | Priority 7 | Priority 8 |
| 152 mm or less | A5 | A5/a \% | A5S/69 \% | A4S/a \% | A4/a \% | B5S/84 \% | 5/a \% | B4/a \% | A3/a \% |

| Original length=Receive d original size*(1/a) | Optimum paper | Selected paper size / Division operation |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Priority 1 | Priority 2 | Priority 3 | Priority 4 | Priority 5 | Priority 6 | Priority 7 | Priority 8 |
| 153 to 311 mm | A4S | A4S/a \% | A4/a \% | B4/a \% | A3/a \% | - | - | - | - |
| 312 to 384 mm | B4 | B4/a \% | B5/a \% | B5S/84 \% | A3/a \% | A4/a \% | A4S/a \% | - | - |
| Over 384 mm | A3 | A3/a \% | A4/a \% | B5S/84 \% | - | - | - | - | - |

- a : Set magnification
(b) B4 width at reception

| Original | Optimum | Selected paper size / Division operation |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| length=Receive <br> d original <br> size*(1/a) | paper | Priority 1 | Priority 2 | Priority 3 | Priority 4 | Priority 5 | Priority 6 | Priority 7 | Priority 8 |
| 189 mm or less | B5 | B5/a \% | B5S/71 \% | B4/a \% | A4S/82 \% | A4/a \% | A3/a \% | - | - |
| 189 to 384 mm | B4 | B4/a \% | B5/a \% | B5S/71 \% | A3/a \% | A4/a \% | A4S/82 \% | - | - |
| Over 384 mm | A3 | A3/a \% | A4/a \% | A4S/82 \% | - | - | - | - | - |

- a : Set magnification
(c) A3 width at reception

| Original length=Receive d original size*(1/a) | Optimum paper | Selected paper size / Division operation |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Priority 1 | Priority 2 | Priority 3 | Priority 4 | Priority 5 | Priority 6 | Priority 7 | Priority 8 |
| 219 mm or less | A4 | A4/a \% | A4S/69 \% | B4/85 \% | A3/a \% | - | - | - | - |
| Over 219 mm | A3 | A3/a \% | A4/a \% | A4S/69 \% | - | - | - | - | - |

- a : Set magnification

### 2.4.2 Cassette / paper selection

- The cassette and paper selection is performed by using two parameters of the [Administrator Settings] -> [Fax Settings] -> [TX/RX Settings].
- [Print Paper Selection]: Auto Select, Fixed Size, Priority Size: a
- [Tray Selection for RX Print]: Auto, Tray 1, Tray 2, Tray 3 and Tray 4: b

## NOTE

- When " $b$ " is fixed to tray $1,2,3$ or 4 , "a" becomes invalid.
" Only when " $b$ " is set to Auto, "a" becomes valid.
- Only A3, B4 and A4 sizes can be selected for the fixed size and preferential size modes.
- Bypass cannot be specified as fix-tray.
- Page dividing function becomes invalid when the tray is fixed.

### 2.4.3 Compulsory memory reception

- The function to enable to print out by operations without printing out documents at reception in the FAX communications.

## (1) Related settings

(a) Compulsory memory reception function

- Set in the [Service Mode] -> [FAX] > [System] -> [Display Setting].
- When this setting is set to "OFF", display and actions related to the Compulsory memory reception are not performed. In addition, you can not perform operations. If this setting is not set, the following Compulsory memory reception function used is also set to disabled.
(b) Compulsory memory reception function use
- Set in the [Administrator Settings] -> [Fax Settings] -> [Function Settings] -> [Memory RX Setting].
- When this setting is set to "NO", the compulsory memory reception actions are not performed at reception. In addition, you can not display, erase and print the compulsory memory reception documents. The compulsory memory reception documents are displayed on the main menu irrelevant to this setting.

## (c) Compulsory memory reception password

- Within eight digits (0 to 9)
- Set in the [Administrator Settings] -> [Fax Settings] -> [Function Settings] -> [Memory RX Setting].
- This setting is required to display, delete or print the compulsory memory reception documents.

## (2) Operation

(a) Necessary conditions for this function

- When there is the compulsory memory reception function, and it is used, the compulsory memory reception action is performed.

## (b) Line seizure

- It is possible to receive up to 500 compulsory memory reception jobs including the normal reception and the substitute reception. When 500 compulsory memory reception jobs are received, machine will not catch the line. (Except the case that the polled transmission documents and bulletin board documents are registered.)

## (c) Reception

- When the reception is performed in the compulsory memory reception mode, printing is not performed even with recording paper and the reception is performed in memory as the compulsory memory reception documents.
- The same as in the polled reception and manual reception.
- The auto forwarding setting is neglected in this mode, and the compulsory memory reception is performed.
- When SUB is received, related applications will start.
(d) Setting change

When there are received compulsory memory reception documents, even if the compulsory memory reception setting is set to invalid in the utility mode, the compulsory memory reception file is not printed.

- For printing, the compulsory memory reception setting is required to be set to "ON."

### 2.4.4 Closed reception (Junk FAX)

- The closed reception function used only at the time of the reception by using the F-code SID signal. NOTE
- You can not use this function with the F-code communications.
(1) Closed reception function
- Set in the [Service Mode] -> [FAX] > [System] -> [Display Setting].
(2) Closed reception function use
- Set in the [Administrator Settings] -> [Fax Settings] -> [Function Settings] -> [Closed Network RX].
- When this setting is set to "No", the closed reception actions are not performed at reception.
(3) Closed reception password
- Four digits (0 to 9)
- Set in the [Administrator Settings] -> [Fax Settings] -> [Function Settings] -> [Closed Network RX].

## PQ THEORY OF OPERATION HD-524

## 1. CONFIGURATION

### 1.1 Outline

- Executes mirroring (RAID 1) of 2 hard disks (hereafter: HDD). (A single HDD is installed as standard, the second is an optional addition)
- Prevents data loss by duplicating data on the HDD.
- Improves data safety/reliability through protecting customers important data from an unexpected failure. Furthermore, it reduces a downtime due to the HDD failure

| $[1]$ | HDD (A) (Master drive): 250 GB | $[2]$ | HDD (B) (Slave drive): HD-524 250 GB |
| :--- | :--- | :--- | :--- |
| $[3]$ | Job data | $[4]$ | MFP board (MFPB) |

### 1.1.1 About RAID 1

- RAID 1: Redundant Arrays of Independent Disks 1
- Simultaneously write identical data to 2 HDDs. This procedure is known as data mirroring (duplicating).
- If one HDD fails, the risk of the other HDD failing at the same time is minimal, therefore the MFP can continue operating.

## NOTE

- The added HD-524 (250 GB) does not change the data capacity same as the standard 250 GB HDD that can be stored on the HDD.

### 1.2 Unit configuration

| $[1]$ | HDD (A): Equipped as standard (Master drive) | $[2]$ | HDD (B): HD-524 250 GB (Slave drive) |
| :--- | :--- | :--- | :--- |
| $[3]$ | MFP board (MFPB) | - | - |

## 2. OPERATION

- At normal operation, a "Master Drive" is used when the machine reads out data and the "Slave Drive" is used on the backup-side.
- The master drive and the slave drive read out data simultaneously.
- When HD-524 is installed in the initial state, the standard equipped HDD (A) is specified as the master drive and HD-524 (B) as the slave drive.

### 2.1 HDD master/slave automatic switching control

- During correct HDD operation, the master drive and slave drive roles are locked.
- The slave drive automatically switches to the role of the master drive only during a restart when a master drive data read/write error (hereafter: R/W error) occurs
- The machine operation can be continued or restarted without HDD data loss through accessing the drive that is switched to the new master drive.
Example: When an HDD (A) error occurs

| $[1]$ | HDD (A): R/W error occurs in the master drive | $[2]$ | Switch the roles of master drive and slave drive |
| :--- | :--- | :--- | :--- |
| $[3]$ | HDD (B): During normal operation (slave drive -> master <br> drive) | $[4]$ | MFP board (MFPB) |

### 2.2 HDD failure detection control

- When an R/W error occurs on either the master drive of slave drive, the trouble code (CFA14: Application error inside the MFP board) is displayed on the control panel and the current job forcibly terminates.
- Restart the machine, either of the trouble codes (CD013 to CD017) relating to HDD mirroring will be displayed.
- Restart the machine, the master drive will change over, which resets the trouble screen and enables execution of a job.
- See below for the actual content/function of each trouble code

## NOTE

- It requires to disconnect the machine power cable before the faulty HDD is attempting to be replaced. The replacement of the HDD is, however, enabled at a timing at which the machine does not execute a print job.
HDD mirroring trouble codes

| Trouble code | Item | Outline |
| :--- | :--- | :--- |
| CD013 | HDD mirroring error master | A master drive R/W error has occurred during the mirroring operation. |
| CD014 | HDD mirroring error slave | A slave drive R/W error has occurred during the mirroring operation. |
| CD015 | HDD mirroring error master slave | An R/W error has occurred on both drives during the mirroring operation. |
| CD016 | HDD mirroring error master (rebuild) | A master drive R/W error has occurred during the HDD mirroring rebuilding. |
| CD017 | HDD mirroring error slave (rebuild) | A slave drive R/W error has occurred during the HDD mirroring rebuilding. |

- R/W error: Read error/Write error

### 2.2.1 A master drive error has occurred (CD013)

- After trouble code CD013 is displayed, turn the main power switch ON/OFF to switch the role of the master drive to the slave drive.
- Restart the machine, the job can be executed. A message prompting HDD replacement appears on the control panel.
- After the HDD is replaced, the message disappears when the rebuilding is completed.

### 2.2.2 A slave drive error has occurred (CD014)

- After trouble code CD014 is displayed, turn the main power switch ON/OFF to restart the machine and execute the job.
- A message prompting HDD replacement appears on the control panel.
- After the HDD is replaced, the message disappears when the rebuilding is completed.

### 2.2.3 A master-slave drive error has occurred (CD015)

- Trouble code CD015 indicates both HDDs have failed at the same time and both HDDs require replacement. (HDD data loss)
- After replacement of both HDDs, HDD formatting (physical + logical formatting) and video data installation are required.
- If the HDD data has been previously backed up, after replacement of the HDD, the data on the HDD can be recovered through implementing [HDD Data Backup/Restore].

### 2.2.4 A master drive error has occurred during the HDD mirroring rebuilding (CD016)

- If an R/W error occurs while the master drive is being rebuilt, the trouble code is displayed on the control panel and rebuilding is suspended.
- Before completion of rebuilding, due to a master drive error data is not correctly copied to the slave drive. It requires to replace the master drive. (HDD data loss)
- After replacement of the master drive, HDD formatting (physical + logical formatting) and video data installation are required.
- If the HDD data has been previously backed up, after replacement of the HDD, the data on the HDD can be recovered through implementing [HDD Data Backup/Restore].

### 2.2.5 A slave drive error occurred during the HDD mirroring rebuilding (CD017)

- If an R/W error occurs while the slave drive is being rebuilt, the trouble code is displayed on the control panel and rebuilding is suspended.
- After trouble code CD017 is displayed, turn the main power switch ON/OFF to restart the machine and execute the job.
- A message indicating an on-going rebuilding appears on the control panel.
- After the HDD is replaced, the message disappears when the rebuilding is completed.

### 2.3 HDD mirroring rebuild

- HDD mirroring rebuilding represents a process to duplicate all data in the master drive onto the slave drive. (hereafter: rebuilding)
- When an HD-524 is newly installed, or an HDD error occurs and it is replaced with a new HD-524, it requires rebuilding from Service Mode. [Service Mode] -> [State Confirmation] -> [Memory/Storage Adjustment] -> [HDD Mirroring Rebuild] NOTE
- Approximately 1 hour is required for rebuilding
- Never turn off the main power switch, disconnect the power cord during rebuilding.
- During a rebuilding, do not pause or force-quit until rebuilding is completed.
- Jobs can be executed even during rebuilding. However, during a job access performance to the HDD is reduced to approx. $40 \%$. Therefore, it also takes a longer time to complete rebuilding. (The rebuilding speed is lowered without slowing the job processing speed)
- The HDD operating status and rebuilding progress can be confirmed with [Service Mode] -> [State Confirmation] -> [ Memory/ Storage status ].

### 2.3.1 Example: When HDD (B) is installed and rebuilding is executed

[4]

| $[1]$ | HDD (A): During normal operation (Master drive) | $[2]$ | HDD (B): HD-524 (Slave drive) added |
| :--- | :--- | :--- | :--- |
| $[3]$ | Duplicate all data in HDD (A) onto HDD (B) | $[4]$ | Job data |
| $[5]$ | MFP board (MFPB) | - | - |

### 2.3.2 Example: When an HDD (A) R/W error occurs and HDD is replaced

| $[1]$ | HDD (A): Replaced HD-524 (Slave drive) | $[2]$ | HDD (B): During normal operation (Master drive) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Duplicate all data in HDD (B) onto HDD (A) | $[4]$ | Job data |
| $[5]$ | MFP board (MFPB) | - | - |

### 2.4 Format HDD

- At the time of executing HDD format with HD-524 has been installed, both HDD (A) and HDD (B) are formatted. NOTE
- No data exists on the slave drive. Caution is required at the time of formatting the HDD.
- When it is used together with the HDD Data Backup security settings, data can be recovered to the formatted HDD. It requires to backup the HDD data before the HDD is formatted.

## PR THEORY OF OPERATION CU-101/MK-745

## 1. CONFIGURATION

| $[1] \quad$ Duct (MK-745) | [2] $\quad$ Clean Unit (CU-101) |
| :--- | :--- | :--- |

| $[1]$ | UFP filter, deodorant filter | $[2]$ | Suction fan (FM16) * |
| :--- | :--- | :--- | :--- |
| $[3]$ | Exhaust fan/1 (FM14) | $[4]$ | Clean unit drive board (CUDB) |
| $[5]$ | Exhaust fan/2 (FM15) | - | - |

- *: Fan that is supplied with MK-745

## 2. OPERATION

### 2.1 Exhaust control

- The exhaust control collects ultrafine particles (UFP) and odor discharged from the machine into the clean unit using the UFP filter and deodorant filter and transports cleaner air to the outside of the machine. NOTE
- The UFP filter and deodorant filter are not replaced periodically.

| $[1]$ | Clean unit | $[2]$ | UFP filter (main body) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Paper cooling fan (main body: FM8) | $[4]$ | Air route of the duct (MK-745) |
| $[5]$ | Air route of the paper cooling fan | $[6]$ | Air route of the suction fan |
| $[7]$ | Suction fan (MK-745: FM16) | - | - |

### 2.2 Filter configuration

- Two types of filters are present inside the clean unit.
- The UFP filter removes ultrafine particles (UFP) while the deodorant filter removes odor.

| $[1]$ | UFP filter | $[2]$ | Deodorant filter |
| :--- | :--- | :--- | :--- |
| $[3]$ | Exterior cover | - | - |

### 2.3 Airflow

- Air that is exhausted with the paper cooling fan and the suction fan of the machine is taken into the clean unit.
- The exhaust fan/1 and exhaust fan/2 exhaust the sucked air outside the machine via the UFP filter and the deodorant filter.

| $[1]$ | UFP filter, deodorant filter | $[2]$ | Exhaust fan/1 (FM14) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Exhaust fan/2 (FM15) | - | - |

### 2.4 Operation timing

- The suction fan, exhaust fan/1, and exhaust fan/2 are driven at the same time that the paper cooling fan (FM8) of the machine is driven.
- If a clean unit is installed, perform the installation settings. [Service Mode] -> [System 2] -> [Cleaning Unit Setting]

|  | At warm-up | During stand-by | During a print cycle |
| :--- | :--- | :--- | :--- |
| Suction fan | Full speed | Stop | Full speed |
| Exhaust fan/1 |  |  |  |
| Exhaust fan/2 |  |  |  |

## PS THEORY OF OPERATION CU-102

1. CONFIGURATION

| $[1] \quad$ Clean Unit (CU-102) | $-\quad-$ |
| :--- | :--- |

| $[1]$ | UFP filter | $[2]$ | Exhaust fan1 (FM14) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Exhaust fan2 (FM15) | $[4]$ | Clean unit drive board (CUDB) |

## 2. OPERATION

### 2.1 Exhaust control

- Ultrafine particles (UFP) and odor that is discharged from the machine are collected in the clean unit. Then, air that is purified through the UFP filter is discharged from the machine. NOTE
- The UFP filter does not require a periodic replacement.

| $[1]$ | UFP filter | $[2]$ | Air path from the UFP exhaust fan (main body: FM17 and <br> FM18) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Air path from the IH coil cooling fan (models: FM7) | $[4]$ | Air path from the paper exit section |
| $[5]$ | Duct (main body side) | - | - |

### 2.2 Filter configuration

- The UFP filter is located in the clean unit.
- The UFP filter removes ultrafine particles (UFP) while the deodorant filter removes odor.

| $[1] \quad$ UFP filter | $[2]$ | Exterior cover |
| :--- | :--- | :--- |

### 2.3 Airflow

- Air from the UFP exhaust fan and paper cooling fan is drawn into the clean unit.
- The exhaust fan 1 and exhaust fan 2 exhaust the drawn air outside the machine via the UFP filter.

| $[1]$ | UFP filter | $[2]$ | Exhaust fan1 (FM14) |
| :--- | :--- | :--- | :--- |
| $[3]$ | Exhaust fan2 (FM15) | - | - |

### 2.4 Operation timing

- The exhaust fan1 and exhaust fan2 are driven at the same time that the paper cooling fan (FM8) of the machine is driven.
- If a clean unit is installed, perform the installation settings. [Service Mode] -> [System 2] -> [Cleaning Unit Setting]

|  | At warm-up | During stand-by | During a print cycle |
| :--- | :--- | :--- | :--- |
| Paper cooling fan (FM8) | Full speed | Stop | Full speed |
| Exhaust fan1 (FM14) |  |  |  |
| Exhaust fan2 (FM15) |  |  |  |

## IKONIC^ MINOLTA

[^0]:    - *: Range of guaranteed performance for paper feeding

[^1]:    - Conforms to the operating environment of the main body.

[^2]:    - Conforms to the operating environment of the main body.

[^3]:    - Conforms to the operating environment of the main body.

[^4]:    - *1: Size when the paper output tray is pulled out

[^5]:    - *: Size when the paper output tray is pulled out

[^6]:    - Conforms to the operating environment of the main body.

[^7]:    - *1 The content (ID) to be read from the type A card setting differs from which to be read by using AU-201/AU-201S.
    - *2 The content (ID) to be read from the HID Prox card setting differs from which to be read by using AU-201H.
    - *3 The content (ID) to be read from the HID iCLASS card setting differs from which to be read by using AU-202H.

    1. Obtain the loadable driver (ICC_LDR.tar) for the YSoft card reader.
    2. Start the Auth Device Tool Advanced for YSoft CRv2/YSoft CRv3.
    3. Select card type.
[^8]:    - *1 The content (ID) to be read from the type A card setting differs from which to be read by using AU-201/AU-201S.
    - *2 The content (ID) to be read from the HID Prox card setting differs from which to be read by using AU-201H.
    - *3 The content (ID) to be read from the HID iCLASS card setting differs from which to be read by using AU-202H.

    1. Install the loadable driver for the YSoft card reader to the MFP.
    2. Start the Auth Device Tool Advanced for YSoft CRv2/YSoft CRv3.
    3. Select card type.
    4. Select IC card information setting file in [Export Format] and click [Export].
    5. Set the encrypted password.
    6. Save the file (iccConfig.bin).
    7. Start the PageScope Data Administrator, and select the target MFP.
    8. In the [Settings for multiple device] tab, click [Batch setting of IC Card Information].
    9. Using [Browse], select the file saved in step 6.
    10. Click [Open] and type the encrypted password set in step 5.
    11. Click [Next] and select the device to be imported.
    12. Click [Start] and write the file in the MFP.
    13. Check that "Normal" is shown in [Status].
    14. Turn OFF the main power switch, wait for 10 sec ., then turn the switch ON.
    15. Set the authentication user.
[^9]:    - *1 The content (ID) to be read from the type A card setting differs from which to be read by using AU-201/AU-201S.

[^10]:    *: Replace those three parts at the same time.

[^11]:    - *: Total counter value

[^12]:    4. Pull the drum unit [1] to you and remove it from the machine
[^13]:    8. Carry out the [Service Mode] -> [Image Process Adjustment] -> [Gradation Adjust].
[^14]:    5. Remove the manual bypass tray feed roller [1].
[^15]:    1. Open the left cover [1].
[^16]:    4. Using a cleaning pad dampened with alcohol, wipe the roll [1].
[^17]:    11. Open the opening and closing guide [1]
[^18]:    2. Open the dual scan document feeder.
[^19]:    - *: Option

[^20]:    8. Remove the screw [1], and remove the ground terminal [2].
[^21]:    7. Mark the EEPROM/2.
[^22]:    2. Remove two caps [1]
[^23]:    4. Enter [Machine] and [Type] information according to the Table : Machine type information. Then touch [Fix].
[^24]:    5. Remove the screw [1], and remove the connector cover [2].
[^25]:    4. To reinstall, reverse the order of removal.
[^26]:    4. Remove the screw [1], and remove the shaft [2].
[^27]:    4. Remove the C-clip [1] and the bushing [2]
[^28]:    2. Lift up the document feed tray [1].
[^29]:    4. Remove the C-clip [1] and the bushing [2].
[^30]:    9. Remove two screws [1], and remove the reading roller release motor [2].
[^31]:    7. To reinstall, reverse the order of removal.
[^32]:    7. Reinstall the above parts following the removal steps in reverse.
[^33]:    2. Remove the screw [1] and loosen the harness guide [2].
[^34]:    5. Remove two screws [1], and remove the DSC board/2 [2]
[^35]:    - *: The settings made at [Thick $2 / 3 / 4$ ] are available to adjustment at [1200dpi].

[^36]:    - JS-506

[^37]:    1. Place the chart in the document feed tray (Set the chart with its blank side facing upward).

    - DF reading chart (for 1-sided): with the blank side facing up.
    - DF reading chart (for Duplex): with the first side facing up.

    2. Make a full size copy of the chart.
    3. Check that the difference in the widths of $B$ between the chart and the copy sample falls within the target.
    4. Call the Service Mode to the screen.
    5. Touch [ADF] -> [Original Stop Position].
    6. Touch [Sub Scanning Direction 2-Side].
    7. Enter the value from the 10-key pad. (Press the [+/-] key to change the +/- code.)

    - If the difference in the widths of $B$ is greater than the target, enter the $[+]$ value.
    - If the difference in the widths of $B$ is smaller than the target, enter the $[-]$ value.

    8. Touch [Test Copy].
    9. Select the tray loading paper for the test copy.
[^38]:    5.29.11 FS-FN adjustment - 1st Tri-Fold Adjustment/2nd Tri-Fold Adjustment (FS-534SD/FS-536SD/FS-537SD)
    (1) Use

    - To adjust the positions of the 1 st Tri-fold and 2nd Tri-fold for the Tri-fold printing.

[^39]:    - *1: When UK-212 is installed.

[^40]:    A sample of C_UpdateList.ini

[^41]:    7. Select the token to be deactivated, and click [Registration].
[^42]:    4. Loosen two screws [1].
[^43]:    - Link to the wiring diagram ( N.4.16 FS-537/FS-537SD)
